GREAT BRITAIN. The four chief political parties in Great Britain at the present time are the Conservatives, the Liberals, the Irish Parliamentary or Home Rule Party, and the Liberal-Unionists. The Conservatives and the Liberals are the lineal descendants of the old Tories and Whigs, and although their political ideas are far more advanced than those of their predecessors, they maintain relatively the same attitude toward the questions of the day. The professed policy of the Conservatives is the maintenance of the Empire, the preservation of the Constitution in its present form, the union of Church and State, and the general conservation of vested interests. The Liberal Party comprises the great majority of the Dissenters in England, and of all the voters in Scotland and Wales, but it is nearly always in the minority in England itself. Its policy is one of abstention from foreign complications, economy in expenditure, and reform in the Constitution. The Radicals, who form a wing of the party, desire disestablishment of the State

Church, manhood suffrage, free education, and the abolition of the House of Lords. The Liberal Party was divided on the question of the South African War in 1899-1902. The whole party opposed it in the beginning, and agreed in criticising the conduct of the war by the Government. But while the majority favored granting a liberal measure of home rule to the Boers, a Radical minority advocated the independence of the republics. The Home Rule or Irish Parliamentary Party was founded mainly through the efforts of Charles Stuart Parnell (q.v.), and is composed entirely of Irish members. It subordinates all other issues to that of Home Rule (q.v.) for Ireland, although it advocates immediate reform of the Irish land system and of Irish taxation, and is in favor of the establishment of an Irish Catholic university. It has acted with the Liberals since 1886, and violently opposed the Boer War. The Liberal-Unionists separated from the Liberals in 1886 on account of Gladstone's advocacy of home rule. Since that time they have acted with the Conservatives, their leader, Mr. Joseph Chamberlain, becoming the most pronounced advocate of an aggressive foreign policy and of the unconditional subjugation of the South African republics. In the general elections for Parliament held in October, 1900, 334 Conservatives, 186 Liberals, 82 Home-Rulers, and 68 Liberal-Unionists were returned. For the development of English political parties, consult: Cook, *History of Party from Charles II. to the Reform Bill* (London, 1836-37); Kebbel, *History of Toryism, 1783-1881* (London, 1886); Kent, *English Radicals* (New York, 1899).

GREECE. There has never been in Greece a division of the voting population into great parties on great political issues, but in modern Greece, as in ancient Greece, the grouping has been rather that of factional followers of some strong political leader. In the frequent change of its ministries Greece bears a striking resemblance to France and Italy, and, as in those countries, the change has very seldom meant a revolution in policy. For the greater part of the decade 1880-90 the so-called parties grouped themselves around two leaders, Tricoupi and Delyanni, from whom were derived the names Tricoupiists and Delyannists. In the general election of 1890 part of the Delyannists—then the opposition party—broke away from their former political associates, and under the leadership of M. Ralli formed a new party organization known as the Neo-Hellenic or Young Greek Party. M. Tricoupi died in 1896, and the leadership of his faction fell to M. Theotokis. His followers, called both Tricoupiists and Theotokists, represent the more conservative tendency in Greek politics. In 1901 a new political group formed about M. Zaimis, who became Premier in that year. The parliamentary strength of the three factions in 1902 was given as: Delyannists, 82; Theotokists, 75; and Zaimists, 46.

HUNGARY. Hungary presents the interesting example of a country with a parliamentary form of government in which a single political party has retained uninterrupted control for upward of thirty-five years. This party is the Liberal Party—the party of Francis Deák and Koloman Tisza, whose able leadership has been a strong factor in its continued success. During the rule of the party of Deák, which began with the suc-

cessful passage of the *Ausgleich* of 1867 and lasted until 1875, the opposition consisted of a party of radical Magyars who refused to accept the compromise, but who were in all other respects Liberals, and of a small group of Rumanians and Slavs whose opposition was racial. After Deák's withdrawal from public life in 1875 this radical Magyar party, under Tisza, who became Premier, united with Deák's followers to form the Liberal Party of to-day, which has since continued in control. The Premiership of Tisza himself lasted from 1875 to 1890. During this period the principal opposition came from a small but earnest body of radicals known as Kossuthists, followers of the younger Kossuth, who contended that the only bond of union between Austria and Hungary should be the personal one of the sovereign. This faction has been represented by as many as 90 Deputies in the Parliament. The principal reason for the absence of two great political parties in Hungary, however, exists in the presence of the subordinate races—chiefly the Croats and Slavonians. It is their presence which tends to force the Magyars to act in concert, and although in parliamentary affairs they take practically no part, they constitute the real political opposition.

ITALY. There is no well-defined party organization in Italy. For fifteen years after the death of Cavour in 1861 the Government was directed by a Ministry from the Constitutional Right or Conservative side of the Chamber, but after 1876 the Liberal Left came into power, and the Right almost disappeared. The Left has been largely dominated by radical elements. Its accession to power marked the domination of the southern Italians in politics and the era of personal groups or factions without other guiding principle than that of political or financial self-interest. Republican and Socialist groups have also played a part in Italian politics. A peculiarly Italian party is that of the Irredentists, who seek to unite with Italy the Italian portions of Austria, Switzerland, and France, or unredeemed Italy (*Italia irredenta*). A serious embarrassment in Italy since the union has been the abstention of good Catholics, under direction of the Vatican, from participation in politics.

JAPAN. Political parties in Japan, in the modern sense, can be said to date practically from the promulgation of the Constitution in 1889, although the political groups from which they were formed have a somewhat earlier beginning. In their origin they are developments of the four old clans (Satsuma, Choshu, Tosa, and Hizen), and their division was fixed by clan jealousy and not by political issues. The Satsuma and Choshu clans were more closely allied to the Emperor and more aristocratic in their tendencies than the other two. Their members formed a group which is particularly strong in the Upper Chamber of the Diet, and has played but little part as a party organization in the general elections. Their influence has been felt largely through their great leader, Marquis Ito (q.v.). They have been called Constitutional Imperialists. From the Tosa clan was formed the Liberal (Fuyu-to) Party, and from the Hizen clan the Progressive (Shimpo-to) Party. By the Constitution the Ministers are dependent on the sovereign by whom they are appointed, but in reality the tendency, often interrupted since 1890,

has been to make them more and more dependent on the Parliament. The result has been a curious succession of partisan and non-partisan Ministries. But the organization in 1902 by Marquis Ito of the *Seiyu-Kai*, or Constitutional Political Association, which practically amounted to an amalgamation of the old Liberals, and the more progressive of the aristocratic Constitutional Imperialists seemed to indicate a formation of parties on new lines, and to be a practical recognition by the representatives of the old nobility of the necessity for party government.

NETHERLANDS. The history of political parties in the Netherlands has been an uneventful one, due largely to the fact that during the greater part of the last half-century the Liberals have been in almost undisputed control of affairs. There have been, however, infrequent overturnings of their régime, brought about generally by a temporary coalition of the opposing group. The most recent revolution of this sort took place in 1901. The Catholic Party has for many years formed the most compact and well-organized group of the opposition, but its refusal to participate in coalitions had rendered its opposition of little effect. The last few years, however, have been marked by a remarkable growth in the power of the Orthodox Protestant Party or Anti-Revolutionists, who for some time were satisfied to take only a passive part in political affairs. This party, which fears Liberalism more than Catholicism, under the leadership of Dr. Abraham Kuyper (q.v.), finally effected a coalition with the Catholics, and in the elections of 1901 achieved a striking victory over the Liberals, who were weakened by dissensions and by a reputed alliance with the Socialists. A Clerical Anti-Liberal Ministry was formed in which the Catholics were given three portfolios. Other parties represented in Parliament, but with little real power, are the Historic Christians, Radicals, and Socialists.

PORTUGAL. Between 1834 and 1852, the old Absolutist party having become extinct, the Liberals, who had successfully opposed the Absolutists, divided into two parties, the Chartists, who supported the strongly monarchist charter of 1826, and the Septembrists, who rallied around the popular Constitution of 1822. A coalition of Septembrists and Chartists, known as Regenerators, took control of the government in 1852, but this coalition soon broke up and the Historic Left was formed from its remnants and merged in 1877 with a new Reformist party, as Progressists. The Regenerators now form the Right, or conservative section; the Progressists the Constitutional Left. There is also a small but active and growing Republican Party, formed in 1881.

SPAIN. Spanish parties have been in a state of confusion ever since the beginning of the struggle for constitutional government. During the first third of the nineteenth century the struggle between absolute monarchy and constitutionalism brought into existence different parties maintaining all gradations of political opinion from absolutism to radicalism. After 1833 the dynastic parties of Carlists and Cristinos arose. (See CARLOS, DON; SPAIN.) There were also two Liberal parties—Moderates and Progressists. These parties disintegrated about 1850-51 and new temporary combinations were formed. The revolution of 1868, which overthrew Isabella II., was

followed by a struggle between Republicans and Monarchists which, after the resignation of King Amadeus in 1873, resulted in the short-lived republic under Castelar. In 1874 the monarchy was restored, and in 1876 the new Constitution gave opportunity for a new alignment. Under this there were two constitutional monarchist parties—the Conservatives, made up chiefly of the clergy and aristocracy, and the Liberals (Constitutionalists or Dynastic Left). In addition to these two true political parties were the Carlists, who were irreconcilable absolutists, the Republicans, and the Possibilists (a name having much the same meaning as Opportunists in France). The Republicans have an increasing strength in Spain. For many years Cánovas del Castillo and Sagasta, the respective leaders of the Conservative and Liberal parties, had been alternately in power. Just before the war with the United States Sagasta (q.v.) and the Liberals again took the helm. The peace negotiations brought the Conservatives once more into power, but the administration was a troubled one. Spain has, in fact, since 1898 entered upon a course of readjustment to new conditions which has its effect upon the parties.

SWEDEN AND NORWAY. The Scandinavian dual monarchy really comprises two distinct nations with one King and a common administration for war and diplomacy. Each has therefore its distinct national politics. The parties in Sweden are the aristocratic Conservative Party, forming the Parliamentary Right, and having its strength in the cities; and the rural Democratic Party, the Parliamentary Left, known as the Rustics. In recent years an urban Democratic Party of decidedly radical tendencies has arisen. The Socialists, organized as a party in 1889, joined the Democrats and a demand was made for universal suffrage. Norway is the most democratic country of Europe socially and, except Switzerland, in its political constitution. For many years the Democratic majority in the Storting was in conflict with the King and his Ministers, chiefly over the budget. In 1872 an attempt was made to secure a responsible Ministry from the Parliamentary majority. In 1884 the King yielded and at first attempted to form a Conservative Ministry, but was obliged to call upon the Left. In 1886 the Left split into the Old Left and the New (Liberal) Left. The conflict that ensued brought out three parties—Conservative, Ministerial, and Radical, the second being due to the attempt of the Prime Minister, Sverdrup, to hold his position in spite of party defeat. A Conservative Ministry was formed in 1889. At the same time a nationalist agitation began and grew to large proportions. The Conservatives were defeated in 1891 on a bill to regulate the relations between Sweden and Norway. The Radical became a nationalist party. This agitation in Norway, threatening the union, developed a counter-movement in Sweden, so that practically a Norwegian and a Swedish party have arisen in the combined monarchy.

SWITZERLAND. There is no party government in Switzerland and no party machinery, such as is necessary in countries where there is party government. Minority representation is responsible for this. There are parties, however. The political history of the present confederation begins in 1847, when the Radicals triumphed over the Cath-

olic Sonderbund. Moderates, Radicals, and Catholics were thereafter the parties that appealed to the suffrages of the people. The two former divided at first on the attitude of Switzerland toward the revolutionary movement elsewhere; then on railroad development, and other questions. In the struggle over constitutional revision from 1864 to 1874 revision was opposed by the Ultramontane Catholics, and by the French and Italians, who feared the domination of the German cantons. After the revision there were new adjustments of party relations. The Vatican decrees of 1870 were opposed by a body of Swiss Catholics, who rejected the dogma of Papal infallibility. They were known as Old Catholics and their recognition by the Swiss Government as the true Catholic body precipitated a contest with the Vatican and the Ultramontane Swiss Catholics. The Ultramontanes or Clericals, the legislative Right, became a strong and aggressive political body. On the other side the Radicals form the Extreme Left, believing in the absolute severance of both Protestant and Catholic churches from politics. The Radicals differ in their attitude on questions outside of Church matters, the French being opposed to the national centralization which is sought by the Germans. The Centre, or Liberal Conservative party, is far from homogeneous and united. It is made up mainly of the conservative moneyed classes. A Catholic People's Party was formed in 1894. Socialist party movements, although many have been set on foot by foreigners who have found asylum in Switzerland, have not flourished on Swiss soil, but the Grütliverein, a society founded in 1838 on a democratic basis, has been gradually adopting socialist ideas.

Consult: Seignobos, *A Political History of Europe Since 1814*, trans. by S. M. Macvane (New York, 1900), a very useful compendium of European political history; Lowell, *Governments and Parties in Continental Europe* (2 vols., Boston, 1897), an invaluable and thoroughly scientific examination of the political systems of Austria-Hungary, France, Germany, Italy, and Switzerland; Rohmer, *Doctrine of Parties* (1844); Woolsey, *Political Science* (2 vols., New York, 1886). See the sections on the government and history of the different countries, to which the history of parties closely relates itself.

POLITICAL SCIENCE. That branch of the social sciences which deals with the organization and life of the State. It comprises the consideration of the general problem of the origin and nature of the State; investigations into constitutional forms, political forces, and modes of public administration; and the attempt to establish sound rules and maxims of political action. The characteristic feature of political and legal, as distinguished from purely social, facts lies in the presence, in connection with the former, of a definitely organized personal authority endowed with determinate functions and enforcing its decrees by a fixed sanction.

In the original Greek sense 'politics' refers to the entire art of realizing the ethical ideal in the State by the establishment and maintenance of orderly government; but in modern times this term is often used in a much more restricted sense. The characteristic political fact, according to the modern usage of language, is the struggle for personal authority in an organized community, as well as the struggle for the maintenance

of the power of the whole State. The definite organization of power for the purposes of orderly government, the marshaling of popular support and of popular opinion, the creation of centres of control, and the defense of the entire structure of the State against attacks from without and from within—these constitute the characteristic problems of politics in the narrower sense. Whenever we deal with the dynamic facts of State life we therefore have primarily 'political' considerations. This is the case in such subjects as diplomacy and international politics, party politics, and all the creative activities of the government. In this sense it is a political action to appeal to voters and to organize them into parties, to advance the candidacy of certain persons for office, to create a willingness for effecting changes in the law, or to obtain treaty advantages from foreign powers.

But State life may also be viewed as static—established in certain permanent forms and administered according to fixed rules. Here the conditions of political struggle for power and advantage are almost entirely eliminated and the State is looked upon as a commonwealth administered for the benefit of all citizens. The studies of public law (international, constitutional, and administrative), jurisprudence, and the technical methods of administration belong under this heading. They deal with State life as settled, as administered only by expert authorities and not immediately affected by the popular struggle for political power. By analogy this group of studies may be said to deal with the anatomy of the State, while the dynamic studies deal with its physiology.

Though the fundamental fact of political struggle will always remain the chief characteristic of politics, it must also be noted that the sphere of static institutions is constantly expanding as the State develops in civilization. In the earlier ages the struggle for power swallowed up all available energies, and all considerations were subordinated to the political success of competing groups. Administration was viewed merely as the opportunity of the ruling group to fortify its position and to enjoy the fruits of power and influence. Even the 'benevolent despotism' of the eighteenth century held that the chief reason why the prosperity of the lower classes should be protected was to maintain their value to the Government as taxpayers. In an absolute monarchy the intrigues among contending factions seeking royal favor usually absorb the entire attention of the political classes, leaving but little to be devoted to the administration of the commonwealth. Now although a system in which political struggle would be entirely eliminated is perhaps inconceivable, the ideal of a commonwealth demands that the ordinary administration of the State be placed as much as possible outside of the sphere of personal struggles for political power. For this reason the civil service should be rendered independent of political changes and an expert administration placed in charge of the current affairs of the commonwealth. Among the practical problems of politics at the present time there is none more important than the question as to how far the political representatives of the citizens—the parliamentary body—can profitably control, and interfere with, expert administration. While the sphere of parliamentary interference and control over the adminis-

trative departments may seem to be contracting, this is not to be taken as a sign of the absolute failure of parliamentary government, but as an indication that the development is toward a more perfect adjustment between the popular or political and the expert agencies in government.

Above the two aspects of political dynamics and statics, and embracing them both, there stands political theory or political philosophy, which deals with the general problem of the nature of the State. Viewing the State as a universal form of human association, it attempts to analyze the principles upon which its authority rests and according to which its functions are performed. Closely allied to it is the subject of political ethics, which tests the ideals of State forms and of political action. Among the Greeks these various aspects of political thought were not dissociated; politics were considered as the means of giving practical form and existence to the true ethical ideals. The Hellenic sense of concrete vision, however, guarded against a confusion of existing institutions with the ideal schemes of philosophical discussion. This distinction was not kept clear in the Middle Ages, and in self-defense the modern school of political science, following Machiavelli, has striven clearly to distinguish the actual from the ideal.

THE PURPOSES OF POLITICAL SCIENCE. The primary purpose of political science is the understanding of the general laws of State life. This, however, does not involve the tracing back of political institutions to primal impulses in animal life and to dominant influences exerted by inanimate nature, a work which sociology and social psychology are attempting to do. Political science takes interest, motives, and purposes as it finds them, investigates their relations to each other, traces their mutual influence, and studies the political actions and institutions created by them. Thus in a modern State it will investigate the grouping of interests in parties, observe the leading personalities who embody the purposes of large groups of men, and study the methods through which these purposes are expressed in legislation and realized through administrative action. The necessity of a scientific basis for all political study would not seem to be in need of emphasizing. Without it the doors are thrown wide open to artificial construction, vague generalization, and the gradual sterilizing of originally fruitful concepts through mechanical repetition. Political science must constantly draw new life from the facts of history and of contemporary action.

The second purpose of political science is the understanding of the forces, forms, and practices of contemporary political life. Although the aid of history is essential toward a thorough understanding of contemporary institutions, a minute analysis of their actual workings is equally indispensable in political science. This need not be purely empirical, but by the comparison of modes of action in various States a basis for scientific induction and generalization will be furnished. This purpose will therefore best be achieved by the combination of two methods—the detailed analytical study of institutional forms and administrative technique in any one nation and the comparison of the results thus obtained with institutions and practices in other States.

A third object of political science consists in

the formation of political purposes and in providing a basis for political action. Far from involving merely *a priori* reasoning about human nature and about the actions proper to it, this pursuit is concerned with the establishment of practical conclusions upon the basis of wide and accurate information. Practical life, however, differs from history and sociology, where the investigator in his study of the connection of facts is led on along a seemingly endless chain of causation. Here resolutions have to be formed and action taken before the basis of induction is complete. In this aspect politics is an applied science—both normative and teleological—which determines the best mode of political action upon the basis of the most complete scientific information procurable.

RELATION OF POLITICAL SCIENCE TO OTHER FIELDS OF KNOWLEDGE. The relation of politics to the general science of society has already been indicated; its field is more restricted and the character of its methods teleological rather than causative. (See SOCIOLOGY.) The difference between the purposes and methods of sociology and of politics might be further indicated by considering how either would treat the career of a statesman like Lincoln. The science of politics would study the principles and purposes embodied in his character in a concrete manner; sociology, on the other hand, would attempt to trace these composite factors back to their ultimate causes, and, passing beyond the energies manifesting themselves in the political struggle, would probe into their psychological and physical origins. The relation of politics to *psychology* also is that of a teleological to a causative science. All political institutions may be looked upon as psychological facts having their existence only in the mind, although they may be of the greatest tenacity and are in turn productive of concrete facts such as public buildings and improvements. But psychology, like sociology, is a causative science, going back of the purpose or concept with which politics starts, and trying to investigate its psychic and physiological origins. The science of *economics* deals with a different set of social phenomena, which, however, have the closest bearing upon politics. Not only is political influence largely determined by economic power, but the constant interference of political agencies with economic interests and processes makes it necessary for political science to give special attention to economics. The field of *history*, like that of sociology, embraces political action together with the other manifestations of social life. But history differs specifically from politics in that its purpose lies in tracing individual chains of causation, whereas politics, by the use of the comparative method, establishes broader generalizations. The science of *statistics* furnishes a basis of induction for all the social sciences. Both in the study of the composition of political forces and of the results of political action regarded as experiments, the aid of statistics is indispensable. The knowledge of the material body and of the physical basis of State life is furnished by the sciences of *ethnology* and *geography*, the results of both of which form the most essential data of political science. Among the other natural sciences *physiology* and *biology* are of special importance to political science. Although the similarity of the life processes in the State and in the physical organism have been

exaggerated in the organic theory of the State, the analogy of historic to organic development, as opposed to purely mechanical construction, will always remain valuable. The absolute identification of biological, social, and political laws of development is, however, being abandoned and is giving way to a tendency to view political phenomena under the aspect of psychological facts to be explained rather by the laws of association and imitation than by the principle of organic structure and growth.

THE METHODS OF POLITICAL SCIENCE. The scientific method of politics acquires its materials by the historic study of individual institutions, by the analysis of contemporary political life, by statistical investigation, and by the comparative study of institutions. On the basis of the facts thus secured it arrives by the process of induction at the general laws and principles of political action. The most distinctive features of this method are a sharp juristic analysis of institutions and the discovery of true analogies in different systems. By the application of this method the materials furnished by a number of auxiliary sciences are subjected to analysis and become the elements for a recomposition which results in a clear and definite grouping of social purposes in the form of political action. As the facts with which politics deals are much more definite than those of the general social sciences, and as political institutions and laws constitute, as it were, a precipitation of social forces, endowed with great permanence and solidarity, the study of political development will always remain the backbone of historical work. Although we need not accept Freeman's dictum that history is past politics, it may be said that historical forces are most clearly understood, although perhaps not completely fathomed, when seen from the point of view of the growth and succession of political institutions and laws.

The principal methods auxiliary to political science are the historical, the statistical, the experimental, the analytical, and the deductive method. Political studies have always drawn their material chiefly from the recorded history of mankind, and are therefore assisted by the technique of the historical method—the critical scrutiny of documentary evidence and the mastery of the laws of cause and effect. But although politics, as indeed every other social science, has thus to make use of historical material, its problems differ distinctly from those of history. It is the function of history to explain a succession of events and actions through the discovery of a causal relation. The function of politics, on the other hand, is to explain a given institution through an investigation of its origins as well as through comparison with similar institutions elsewhere. To history all the transformations of a given institution are equally interesting; to politics, only those which explain its present character. Thus in the study of the English parliamentary system of the present, political science need not give consideration to the original causes for instituting the British Parliament, as other causes have been substituted upon which the parliamentary régime is at present based. Therefore, in general, in a succession of substituted causes, political science would not go back of the causes directly operative in the institution to be explained, while to history the whole series of substitutions is important.

The statistical method furnishes much valuable and trustworthy material to political science; and for the knowledge of the physical body of the State population statistics and detailed accounts of the economic products are indispensable. Similarly the effect of certain modes of legislation and of political action can best be tested by a study of their numerical results; such as, for instance, the operation of the liquor laws and of laws to foster agriculture, irrigation, etc. But also the more specifically political activities may be approached by the statistical method, as when we study the attendance upon elections, the votes upon constitutional amendments, and the various groupings of political power. We must not, however, overlook the limitations of the quantitative method. An attempt to reduce political action entirely to quantitative form, and thus to trace it back to the working of physical causes, would result in failure, because the complex force of sentiment, sympathy, tradition, and of other psychological factors cannot be quantitatively measured nor reduced with exactness to quantitative causes in the physical world.

Scientific experimentation is not possible in politics, because we cannot use a society purely as a subject of demonstration. Moreover, we are not given the opportunity of studying the influence of any one cause by carefully excluding the operation of all others, as we may do in physical experiments. While, however, the scientific experiment pure and simple is by the nature of things excluded, practical experiments are constantly being made in politics, i.e. courses of action are tried without a knowledge of the exact results to be produced by them, but in the hope that certain improvements will be effected; as, for instance, in changes of the criminal law, or in the methods of nominating and electing public officials. Such action, although not undertaken purely as an experiment, is experimental in the sense that the nature of its consequences can be definitely ascertained only through experience, and that the action is undertaken with a knowledge of the possibility of varying results. Therefore, while politics as a science cannot set aside certain social factors for experimental purposes, as an art it is constantly making experiments in practice which in turn furnish the most valuable kind of material to scientific political study.

The importance of the analytical method has already been indicated above. As in the investigation of political and legal institutions the juristic bias is naturally very strong, there is constant danger in political science of resting satisfied with mere analysis of structural forms. A scientific method, while it must make use of the trenchant instrument of analysis, must also extend its range so as to embrace the real motive forces that lie back of institutional forms. The natural law theory has always favored a purely juristic interpretation of institutions, and the scientific study of politics has been much retarded by the one-sided use of analytical methods which lead to disputes about fine-drawn but unimportant distinctions, while apparent definiteness of the results obtained often causes men to overlook the powerful forces operating in political life.

The deductive method is thus explained by Professor Sidgwick in his *Elements of Politics*: "We assume certain general characteristics of social

man, and we consider what laws and institutions are likely to conduce most to the welfare of an aggregate of such beings." While this method is perfectly legitimate and has been fruitfully employed by most of the great political writers, it would be a mistake to suppose that it is the sole or even the principal reliance of scientific politics. In fact, if employed alone and unassisted by the study of concrete facts, it opens the door to hasty generalization and to the profitless expounding of threadbare theories. In itself it is sterile. It simply analyzes, develops, and applies certain facts assumed to be axiomatic. It takes on the subjective coloring of the writer's mind and it does not in itself furnish a stable basis for the scientific pursuit of political investigation. Politics is made a science through the use of inductive processes. The careful study of political experience and of the ever-varying forces of political life provides the rich harvest of observation upon which general principles and maxims may be founded with a certain amount of warranted assurance; and though it may not as yet provide a large number of exact generalizations and rules for practice, it still is recognized as leading to a fuller mastery than does deductive reasoning, by giving the mind an insight into the wealth of incident and the dramatic action of politics. The deductive method is of value in the matter of applying knowledge to political action, when after a careful study of political forces and institutions their general nature and operation is understood. Such knowledge may then well be applied by a deductive process to concrete political action.

THE BRANCHES OF POLITICAL SCIENCE. In accordance with the general division of political science which has been indicated above, we may group the various branches of the subject as follows:

Political Dynamics—

1. Diplomacy and International Politics.
2. Party Politics.
3. Comparative Legislation.
4. Governmental and Administrative Policies.

Political Statics—

1. Constitutional Law.
2. International Law.
3. Administrative Law and Technique.
4. Comparative Study of Institutions.
5. Jurisprudence.

General and Normative Politics—

1. Political Theory.
2. Political Ethics.

It would, of course, be impossible to deal with the living forces of public life without paying regard to the settled institutions, or, on the other hand, to investigate the latter without giving attention to the motive forces by which they are supported; and, no matter what subject in politics may be under consideration, generalizations belonging to political theory or ethics can never be excluded. While these various subjects are thus intimately interrelated, each of them nevertheless forms the centre for a group of specific considerations and preserves in the main its own point of view. But their mutual relations ought never to be overlooked. A study of the public law of any State without attention being given to political forces and their modes of action fails to convey a just conception of political life. In a State like the American Union, founded upon the theory of government by law deduced from a written

constitution, static and juristic facts are often placed unduly in the foreground. The discussions in the American Congress are usually given a juristic turn, so that, for instance, the consideration of measures dealing with economic subjects like the trusts will be based primarily on constitutional arguments. The greatness of such statesmen as Lincoln consists in their knowledge of the true motive powers and in their readiness when necessary to modify juristic principles so as to adapt them to the living forces of politics—"to throw the Constitution overboard in order to save the Constitution." International law and diplomacy similarly bear a close relationship to each other. Not only is the former largely a result of the efforts of the most enlightened diplomats, but its enforcement is always conditioned by the actual grouping of the various factors in international politics. The study of comparative legislation furnishes materials to general jurisprudence, and this in turn enables the legislator to secure greater harmony and a more effective structure in his legal enactments. Practical politics, while primarily founded upon the grouping of interests, cannot afford to overlook the principles of political theory which pervade the thought of the people and give direction to their action and to their enthusiasms. Political theory, on the other hand, should strive to be an expression of the cardinal facts of actual political life, and consequently the theory of democracy can no longer rest upon the original concept of an ideal state of nature. The intimate connection between practical politics and political ethics would not seem to need emphasizing, were it not for the fact that certain writers like Machiavelli have dissociated political considerations from ethical principles, and also that in the practical politics of the lower type but very little application of ethical motives can be perceived. Even the details of administrative technique have a close connection with dynamic politics, for often a method of action which seems thoroughly convenient, and indeed almost necessary from the administrative point of view, may be subject to grave objections when the political life of the State is considered.

THE LITERATURE OF POLITICAL SCIENCE. It has been intimated with some truth that politics has not as yet fully made good its claim to rank as a science, because political literature lacks that succession of effort which constitutes the progressive element in the natural sciences. In the latter an investigator will take up the work where his predecessor has left off. In politics there has been no such development by successive, long continued effort; any writer considers himself well qualified to contribute a valuable discussion on a subject with which all men of common sense are supposed to be competent to deal. In fact, some of the most famous writers on politics, such as, for instance, Locke and Rousseau, had no political or legal training whatever. In many cases great philosophers have aimed to give completeness to their general system of thought by constructing a part on political science, which is, however, in such cases usually composed merely of deductions from general theoretical principles.

The constitutional studies of Aristotle and the principles developed in his *Politics* form a sound basis for the science of the State; but, unfortunately, he had no successors to carry on the work in his spirit for almost two thousand years.

During the Middle Ages Aristotle exercised a profound influence upon scholastic philosophy, which followed his doctrines very closely. Machiavelli took up the thread, and on the basis of a keen study of political facts, both in the records of Roman history and in the life of his own times, constructed his principles of practical politics. His work is founded upon actual observation, but, like Adam Smith, he deals exclusively with certain definite human activities and characteristics to the exclusion of all others, and constructs for us the Political Man—animated solely by the will to gain political power. Jean Bodin lived in the thick of the religious struggles in France, and his work is a direct result of the need he felt for a definite basis of authority in the shifting circumstances of his time. His theory of sovereignty may be called the portal of modern political science, because it first clearly focuses all political action in the sovereign and places the source of political power within the State itself; but the theory is primarily juristic and has given rise subsequently, to many theoretical constructions which do not accurately express the forces of political life. Three of the great philosophers of the seventeenth century, Hobbes, Spinoza, and Locke, developed political theory as a part of their philosophical system; but, though starting from similar premises, they arrive at entirely different conclusions. The thought of their age was primarily mathematical, and their method is purely deductive, developing a system of political structure from a few principles assumed as axiomatic, in the manner of a theorem in geometry. The impulse which was given at this time to the mathematical sciences, and through them to the physical, led to an effort on the part of Montesquieu to explain the connection between political institutions and physical environment. Scientific in the sense of basing his results upon induction from facts, Montesquieu lacks the critical spirit of the Historical School and is often captivated by mere fanciful analogies. Burke has a scientific conception of politics in the sense of seeing in institutions a natural development and of basing his political principles upon a careful study of political experience; but he idealizes the past and looks upon the present rather with the eyes of the statesman who is defending certain forms of political life than in the spirit of the scientific investigator. Rousseau, Kant, and the entire Classical Liberal School, are all given to a *priori* reasoning; taking as their starting point the rational individual, they endeavor to construct a system of government in which his independence may be preserved. The fact that Rousseau's theory has by varying interpretations been made the basis of Liberalism, of democracy, and even of State socialism indicates the ease with which the deductive method may be used to produce any result desired.

In the nineteenth century a truly scientific method began to be applied to the study of political facts. Savigny, Maine, Ihering, Pollock, Maitland, and Judge Holmes have applied the historic method to institutional and legal facts. The careful observation and analysis of contemporary institutions has led to fruitful results in the works of De Toqueville, Bagehot, Bluntschli, Woodrow Wilson, A. L. Lowell, and Ostrogorski. Writers like Jellinek and Burgess, while juristic in their method, give careful attention to

existing State forms. Cornwall Lewis combines the scientific method of observation with a highly philosophical spirit. There has lately arisen a school of political scientists who apply to their writings the term sociological. They hold that the true study of politics should rest, not upon the legal analysis of institutions, but upon an investigation of the forces of society which are striving to express themselves through political action. They emphasize particularly the existence of groups within the State which represent common interests and are animated by common motives, and they conceive of State life as made up of the struggle and competition between these social groups. The principal representatives of this theory are the Austrians Gumplowicz and Ratzehofer.

The inductive method, based upon observation and the study of recorded facts, is, however, not the only one employed by prominent writers on politics during the nineteenth century. Hegel's purely philosophical construction of the State finds an echo in the writings of T. H. Green and of Bosanquet. The deductive method is used by Sidgwick, Lieber, Mill, and the Liberal School in general. The juristic method of analyzing existing institutions is still almost universally in the ascendant in books dealing with jurisprudence and constitutional law. The works of American constitutional jurists are primarily analytical, and although they devote considerable attention to the history of the formation of the Constitution, this is done in order more fully to explain that instrument, which is then analyzed and examined in all its bearings upon modern government. English jurists like Holland, Anson, and Dicey, following Austin, also still employ this method with preference, although the historic study of law has made great progress in England.

POLITICS, THE. A work by Aristotle discussing the relation of man to the State and the different forms of government, and presenting an ideal State incorporating the best points of various systems. The family is regarded as the foundation of the State, all citizens of which are to have a share in the government and to own

land. The work shows, for its period, much knowledge of history and political judgment.

POLITIQUES, pò'lit'èk' (Fr., political). The name of a party which arose in France in the reign of Charles IX., composed of moderate Catholics and Protestants, and aiming at the termination of the civil strife by a compromise between the two factions on the basis of religious toleration and the preservation of the rights of the State as against the privileges of sectaries. It numbered among its adherents such men as Jean Bodin and De Thou, and was influential in establishing Henry IV. on the throne. See FRANCE.

POLITY (Gk. πολιτεία, *politeia*, polity, citizenship). A term used to describe the system on which a State or a Church is organized as a structural unity. In civil usage, the principal forms of polity are monarchy, the rule of one man; aristocracy, the rule of the best; democracy, the rule of the people as a whole; oligarchy, the rule of a few. In ecclesiastical organization, the principal forms are the Papal, in which supreme government is placed in the hands of the Pope alone; the episcopal, in which it is shared by the whole body of bishops; the presbyterian, where it is held by an assembly of presbyters; and the congregational, in which each congregation is independent of any central government.

POLITZER, ADAM (1835—). An Austrian aurist. He was born at Alberti, Hungary, studied in Vienna, Würzburg, Paris, and London, and in 1871 became professor at the University of Vienna. He had achieved great success in 1863 with the publication of his method of treating deafness consequent on catarrh of the inner ear, and he gathered at Vienna a wonderful collection for the anatomical and pathological study of the ear. The more important works of Politzer are: *Beluchtungsbilder des Trommelfells* (1865); *Lehrbuch der Ohrenheilkunde* (1878-82; 4th ed. 1901); *Die anatomische und histologische Zergliederung des menschlichen Gehörorgans* (1889); and an *Atlas der Beluchtungsbilder des Trommelfells* (1895).

POLIKENES, pò-lik's'é-néz. The King of Bohemia in Shakespeare's *Winter's Tale*. His old friend Leontes, King of Sicily, becomes jealous of him and attempts to poison him.

POLIZIANO, pò-lèt-sè-à'nò, ANGELO (Latinized form, *Politianus* (1454-1494)). An Italian scholar and poet. He was the son of a doctor of civil law, and was born at Montepulciano, in Tuscany, July 14, 1454. The family name was Ambrogini, but Poliziano took his name from his native town—in Latin, *Mons Politianus*. He studied Latin at Florence under Cristoforo Landino, Greek under Andronicus of Thessalonica, the Platonic philosophy under Marsilio Ficino, and the Aristotelian under Argyropoulos. When scarcely fifteen years of age he published a poem of 1400 lines in honor of Giulio de' Medici, who had carried off the palm at a tournament. Lorenzo de' Medici took notice of the brilliant lad, and to afford him the means of continuing his studies appointed him tutor to his two sons, and subsequently gave him a residence in his charming villa near Fiesole, where Poliziano, who was passionately fond of country life, resumed his studies with fresh ardor. In 1484 he accompanied the Florentine ambassadors to Rome, and

was received in a flattering manner by the Pope, at whose request he translated into Latin the Greek historian Herodianus, for which he received 200 gold crowns. He also made Latin versions of the *Enchiridion* of Epictetus, the *Charmides* of Plato, and other works, with such elegance that Erasmus pronounced him a master in translation. After having filled for some years a chair of Latin literature in Florence, he commenced the teaching of Greek. His popularity was so great that pupils came to study under him from all the great cities of Italy, and even from distant parts of Europe; the principal were Francesco Pucei, Fortiguerra, Maffei da Volterra, Grocyn, Thomas Linaere, and Michelangelo. In 1489 appeared his *Miscellanea*, a collection of critical and other observations on the ancient authors. Toward the close of his life he entered into orders, and was made canon of the Cathedral of Florence. He died September 24, 1494. Among the brilliant scholars of the Italian Renaissance, Poliziano occupies a foremost place in virtue of his vigor and originality. While he admired the chaste and noble literature of antiquity, there was nothing servile in his imitations; he reproduced without difficulty the strength of Tacitus, the elegance of Livy, and the conciseness of Sallust; his Latin poems, especially his elegies, display the beauty and ardor of his imagination. Among his vernacular pieces may be mentioned his *Canti carnascialeschi* (Carnival Ballads), remarkable for their felicity of style, sweetness of pathos, and abundance of imagery. Another proof of his varied poetical power was his *Orfeo*, one of the earliest dramatic compositions produced in Italy. Consult: Serassi, *Vita di Angelo Poliziano* (Milan, 1808); Bonafons, *De A. Politiani Vita et Operibus* (Paris, 1845); Gresswell, *Life of Politian* (London, 1805); Roscoe, *Life of Lorenzo de' Medici* (10th ed., ib., 1851); and the two works of Symonds, *The Renaissance in Italy* (ib., 1875-86), and *Sketches and Studies in Italy* (ib., 1879).

POLK, pŏk, JAMES KNOX (1795-1849). The eleventh President of the United States, born in Mecklenburg County, N. C., November 2, 1795. His ancestors, who bore the name of Pollock, emigrated from the north of Ireland early in the eighteenth century. Polk graduated at the University of North Carolina in 1818; then studied law with Felix Grundy (q.v.) of Tennessee, and was admitted to the bar in 1820. Three years later he was elected a member of the Legislature of Tennessee, and soon afterwards (1825) was sent to Congress by the Democratic Party, serving as Speaker in the Twenty-fourth and Twenty-fifth Congresses. In Congress he won distinction by his industrious habits and readiness in debate. During the administration of President Jackson he was one of his chief supporters, and gave the same loyal support to Jackson's successor, Martin Van Buren. As Speaker it devolved upon him to preside over the deliberations of the Representatives at a time when party feelings were bitter, and his rulings were frequently appealed from, although usually sustained by the House. After fourteen years in Congress he was, in 1839, elected Governor of Tennessee, and was nominated for the office again in 1841 and 1843, but was each time defeated by the Whig candidate. Nevertheless, his standing among his party associates was not impaired, and when the vigorous opposition to Van Buren made impossible the latter's

nomination for the Presidency in 1844, especially under the rule which required a majority of two-thirds of all the delegates to the national convention to nominate, Polk was introduced as a compromise candidate and was unanimously nominated on the ninth ballot. The Whig candidate, Henry Clay, had compromised himself in some sections by his attitude in regard to the annexation of Texas, while the Democratic platform was moderately acceptable to both North and South through its advocacy of the 're-occupation of Oregon and the reannexation of Texas.' Polk received 170 electoral votes, as against 105 for Clay. George M. Dallas was elected Vice-President. During his term the Oregon boundary dispute was settled with England, the United States accepting the parallel of 49° as the northern limit, though the party cry which helped to elect Polk was a claim for the entire territory to latitude 54° 40' N. A dispute regarding the boundary of Texas caused, in 1846, a war with Mexico, which resulted in the acquisition, through the Treaty of Guadalupe Hidalgo (q.v.), of California and New Mexico. The chief event of President Polk's internal administration was the enactment of the tariff law of 1846, which was based on the principles of tariff for revenue only, and the establishment of the independent treasury system. The President set himself against the internal improvement mania by vetoing a river and harbor bill, which appropriated a large sum for improvement purposes. As regards the slavery question, the debate over the Wilmot Proviso (q.v.) and over the bill to organize the Territory of Oregon were the most notable events. In private life President Polk was unostentatious, frank, and courteous. His habits were extremely simple, and his character was blameless. He died at Nashville, Tenn., June 15, 1849. His biography, including especially a review of his administration, was written by J. S. Jenkins (Auburn, 1850). A number of his manuscripts and other papers have recently been acquired by the Chicago Historical Society, and his MS. diary may be found in the Lenox Library, New York City. See UNITED STATES.

POLK, LEONIDAS (1806-64). An American soldier and first Protestant Episcopal Bishop of Louisiana. He was born at Raleigh, N. C., educated at the University of North Carolina and at West Point Military Academy. While at West Point he came under the influence of Dr. Melville, afterwards Bishop of Ohio, and was converted. After graduation he resigned from the service, and prepared for the ministry at the theological seminary at Alexandria, Va., being ordained at Richmond in 1830. After a year of church work he traveled in Europe to benefit his health. Upon his return he removed to Tennessee, and in 1838 the General Convention appointed him Missionary Bishop of the Southwest—a field embracing Arkansas, Indian Territory, Mississippi, Louisiana, and Alabama. He retained this post until elected Bishop of Louisiana in 1841. He formulated a scheme for higher education in the South which finally resulted in the establishment of Sewanee University, a charter for which was granted by the State of Tennessee in 1858. At the outbreak of the Civil War his sympathies were wholly with the Southern cause. His travels in pursuance of episcopal duties made him thoroughly familiar with the Lower Mississippi

States, and he urged upon the President of the Confederacy the necessity of their defense. In response he was urged to take a commission, and with the approval of his clerical friends he became a major-general in June, 1861, and accepted the command of Department No. 2, which involved the duty of defense of both sides of the Mississippi from the Red River to Cairo, with headquarters at Memphis. He commanded the Southern forces in the battle of Belmont, participated in the engagements of Shiloh and in the operations which led up to the evacuation of Corinth, took part in Bragg's invasion of Kentucky as commander of the Army of the Mississippi, and fought in the battle of Perryville. In October, 1862, he was made lieutenant-general, and fought at Murfreesboro and Chickamauga. In the last named engagement, it was charged by General Bragg, Polk's delay in making attack lost the victory. As a consequence he was temporarily suspended from his command; but the charges were dismissed by President Davis, who offered to reinstate the deposed general. Declining this offer, Polk assumed the charge of paroled prisoners at Enterprise, Miss., and when Gen. Joseph E. Johnston was assigned to the command of the Army of Tennessee, followed that general in charge of the Department of Alabama, Mississippi, and East Louisiana. He was killed by a cannon-shot while reconnoitring the field of Marietta from Pine Mountain. Consult his *Life* by his son, William M. Polk, M.D. (New York, 1893).

POLKA (from Bohem. *pulka*, half; so called from the half-step characteristic of the dance). A round dance supposed to have originated in Bohemia about 1830. The music is in $\frac{3}{4}$ time, and has the rhythmical peculiarity of being accented on the third quaver of the measure:

It was introduced as a fashionable dance into Western Europe about 1841, and soon became extremely popular; in France in particular it created a perfect furor. Its movement is lively, though not as rapid as that of the galop.

POLLACK (from Gael. *pollag*, whiting, Ir. *pullog*, pollack). A kind of codfish (*Pollachius virens*), common on both coasts of the North Atlantic, and more commonly known in the United States as 'coalfish.' It is dark greenish brown above, sides and below somewhat silvery. It attains a weight of about 30 pounds, and is of value as a food fish. Its habits differ from those of the cod or haddock, for it is to a great extent a surface-swimming fish, and congregates in large schools, which swim about in search of young fishes as food; but they also feed at the bottom like cod. They seem to spawn while swimming about, and their eggs float and hatch in five or six days. Their flesh is highly esteemed, especially about the Gulf of Newfoundland; and their liver yields an excellent oil in large quantities.

The Alaskan pollack (*Nieragra chalcogramma*) is a very similar fish, abundant in the North Pacific, and especially in Bering Sea, where it furnishes the larger part of the food of the fur seal, and is of great value to the natives of both coasts. It is uniformly dark olive, and reaches a length of three feet. Another more sooty species, the 'wall-eyed pollack' (*Nieragra Fu-*

cnasis), is numerous in Puget Sound and on the California coast.

Consult Goode, *Fishery Industries*, sec. 1. (Washington, 1884). See Plate of CODFISH.

POLLAIUOLO, pól'lá-yoo-ó'lo, ANTONIO (1429-98), and PIERO (1443-96). Italian artists of the Florentine Naturalistic School (early Renaissance). Antonio, the elder, goldsmith and painter, was born in Florence in 1429. Antonio became celebrated as a niellist and metal-worker. The paneled decoration for the altar of San Giovanni and the altar candelabra exhibit fidelity to nature and mastery of design. Deep study of antique sculpture, added to a thorough knowledge of anatomy, obtained from dissection, rendered him one of the first draughtsmen of Florence, and caused his final adoption of painting as a profession. His early use of the oil medium was probably due to the influence of Castagno or Baldovinctti, but whether received from these masters direct or from his brother Piero, who was a student of the latter artist, is an unsettled question. In this vehicle are executed the "Hercules and the Hydra" and the "Hercules and Antæus," both in the Uffizi.

Piero became his brother's associate, and it is difficult to distinguish their work. As many pictures were the combined work of both, it may be concluded that in such cases Antonio furnished the design, while Piero executed it in color. Their masterpiece is the large "Martyrdom of Saint Sebastian" (1475) in the National Gallery, London. It exhibits the severe and plastic treatment of Antonio—an accuracy and sureness in drawing that is not found in the works assigned to Piero's hand, such as the "Coronation of the Virgin" (1483), at San Gimignano, signed by Piero, in which the drawing is noticeably defective. The general handling of the color in Piero's work would point to him as being responsible for that portion of the "Saint Sebastian." The "Saint Christopher and the Infant Christ," in the Metropolitan Museum, New York, is probably a work executed wholly by the elder brother. Of their Madonnas there are good examples in the National Gallery, London, and in the Berlin Museum. In 1480 Antonio was called to Rome by Pope Innocent VIII., where he was employed upon monumental work until his death in 1498. Piero died in Florence in 1496.

POLLAIUOLO, SIMONE DEL (1457-1508). A distinguished Italian architect, sometimes called Il Cronaca. He was born in Florence and spent a number of years in Rome devoted to the study of the monuments of antiquity. He was a keen observer, and from his habit, after his return to Florence, of describing with great minuteness the sights of the Eternal City, the nickname 'Il Cronaca' (The Chronicler) was bestowed upon him by his fellow artists. In 1495 he was appointed chief architect of the Duomo, and after the death of Benedetto da Majano he became the architect of the Palazzo Strozzi, to the facade of which he added the splendid cornice, his inimitable masterpiece. He also built the Palazzo Guadagni, a handsome structure in the early Renaissance style, and the Church of San Francesco or San Salvatore al Monte, an edifice imposing in its very simplicity and chaste proportions, which was greatly admired and praised by Michelangelo. Among the few other works that

may be ascribed to him with certainty are the vestibule of the Sacristy of San Spirito, the court of the Palazzo Strozzi, and the great hall in the Palazzo Vecchio. Consult: Anderson, *The Architecture of the Renaissance in Italy* (London, 1896); and Geymüller-Stegmann, *Die Architektur der Renaissance in Toscana* (Florence, 1885-96).

POLLANARRU'A. An ancient city of Ceylon now in ruins, in the Province of Tamankadme, about 60 miles northeast of Candy. It was the capital of the island in 769-1319. Its golden age was in the reign of Prakrama Bahoo I., who fortified it, built a royal palace, a monastery and residence for the priesthood, a superb dagoba, and many other public buildings. When the Malabars took it, about 1204, they demolished and reduced it to its present condition. The most remarkable building is the Jaitawanarama temple. Opposite the entrance is an image of Gautama Buddha 50 feet high. The Satmaha Prasada is a handsome pyramidal building. The palace of Prakrama Bahoo I. is on the borders of the Toopawewa, an artificial lake.

POLLARD, EDWARD ALBERT (1828-72). An American journalist, born in Nelson County, Va. He graduated at the University of Virginia in 1849, and studied law. He went to California and engaged in journalism until 1855, and traveled extensively. At the beginning of the Civil War he was preparing for the Episcopal ministry. From 1861 until its suppression by the military authorities in 1865, he was an editorial writer on the *Richmond Examiner*, and was a merciless critic of President Davis. Near the close of the war, while attempting to run the blockade on his way to England, he was captured and imprisoned for eight months in Fort Warren in Boston. After his release on parole he was again confined in Fortress Monroe by special order of Secretary of War Stanton, but was summarily released by General Butler. His books include: *Black Diamonds Gathered in Darky Homes of the South* (1859), an attempt to show the bright side of slavery; *Letters of a Southern Spy in Washington and Elsewhere* (1861); *Southern History of the War* (1862-66); *The Lost Cause* (1866), a shorter history of the war; *Lee and His Lieutenants* (1867); and *Life of Jefferson Davis with Secret History of the Southern Confederacy* (1869). His books show considerable literary ability, but his violent prejudices prevented any sort of fairness to the objects of his dislike.

POLLARDING (from *pollard*, from *poll*, head). The process very commonly practiced in Europe of cutting off the crown of a tree to make it throw out numerous water-sprouts from the top of the remaining trunk. Trees so treated, called pollards, are not beautiful, but are useful in districts where fuel is scarce, since the branches are cut every third or fourth year. The practice is not common in the United States. Trees of rapid growth, such as willows, poplars, alders, elms, and limes, are most frequently pollarded. While the operation apparently injures the tree, it should be noted that many of the oldest trees in Europe and the largest in diameter have been continuously pollarded.

POLLEN (Lat., fine flour, fine dust). A name applied to the microspores of seed-plants, and

popularly regarded as the 'fertilizing dust' produced by flowers. See **SPORE**.

POLLEN'TIA. An ancient place in North Italy, on the Tanarus, represented by the modern little town of Pollenzo, 33 miles south of Turin, near Bra. The ruins of an aqueduct, an amphitheatre, a theatre, and a temple mark the site of the ancient city, where Alaric and Stilicho fought in A. D. 402 or 403. The ruins of a mediæval royal castle are also to be seen here.

POLL-EVIL. A painful swelling on the head or the neck of horses, which if not attended to may become a troublesome and serious ulcer. It may be caused by striking the head against a beam, straining against the halter, or by an excessive tight rein when driving. If the swelling continues to increase, so that it becomes evident that pus is forming, then the formation of pus must be hastened as rapidly as possible by hot applications, and as soon as this is brought about—which may be known by the tumor being soft to the touch—it must be lanced. All the pus must be discharged, and the means employed—as, e.g., a seton—must be such that any future formation of pus shall run out immediately, thus preventing any corrosion of the bone beneath the tumor. This is all the treatment required, except fomentations of tepid water to insure cleanliness, if the disease be taken in its early stages.

POLLICE VERSO, pŏl'li-sē vēr'sŏ (Lat., with thumb reversed). The sign by which the spectators at the Roman gladiatorial combats expressed their wish that the vanquished gladiator should be put to death. In this case the thumbs were turned up, but it is not clear that turning down the thumbs signified that mercy was to be extended, this being shown according to Martial by the waving of handkerchiefs. The famous painting, "Pollice Verso," by Gérôme, shows the victor standing over his prostrate rival and looking up to the benches for the verdict of the spectators, who are represented with thumbs turned down.

POLLINATION. Transference of the pollen (q.v.) from the stamen of a flower to the stigma of the same flower (self or close pollination) or to that of another flower (cross-pollination). Several terms associated with these processes may be here defined: *Autogamy*, self-pollination of flowers; *alogamy*, cross-pollination; *gitonogamy*, cross-pollination between two flowers upon one plant; *xenogamy*, between flowers of different plants. Flowers containing both stamens and pistils are called *monoclinous*, or *hermaphroditic*: if stamens are in one flower and pistils in another, but both kinds are upon the same plant, the plants are said to be *diclinous* and *monœcious* (Fig. 1); if upon different plants, *diœcious* (Fig. 2). *Anthesis* is the period during which pollination is possible; flowers which remain closed during this period exhibit *cleistogamy* (q.v.), those which open all or part of the time exhibit *chasmogamy*. Flowers whose stamens or pistils or both are of unequal lengths are said to show *heteromorphism*; if two lengths occur, *dimorphism* (Fig. 3); if three are present, *trimorphism*. In *homogamous* flowers the stigmas mature when the pollen grains are shed; in *dichogamous*, these two periods differ. If the stigmas mature first, the flower exhibits *protogyny* or *pro-*

terogyny; if the pollen grains are shed first, protandry or proterandry (Fig. 4).

In general, cross-pollination seems to be somewhat advantageous to plants because it is supposed to prevent close inbreeding, which in both plants and animals seems to result in degeneracy. The reason for this is not known.

There are various devices by which cross-pollination is obtained. The most perfect device is the so-called dioecious habit illustrated by the willows (Fig. 2). In the so-called monoecious habit (Fig. 1), cross-pollination is less certain,

FIG. 1. MONOECISM.

The hazel (*Corylus*), showing pistillate flower clusters (*b*) and staminate catkins (*a*) on the same twig. Self-pollination is possible here, as is never the case in a dioecious plant like the willow (Fig. 2).

though it is often facilitated by the pistillate flowers being uppermost on the tree. In the case of insect pollinated flowers cross-pollination is sometimes secured by proterandry (Fig. 4), or protogyny. In many cases the stigma when mature is higher than the stamens and hence self-pollination is difficult. Perhaps the most effective device to insure cross-pollination is the impotence of the pollen upon the stigma of the same flower and even of other flowers on the same plant. It must be remembered that in some plants self-pollination is not only possible, but even common. It is invariably the case in cleistogamous flowers. (See CLEISTOGAMY.) In the subterranean flower of the violet self-pollination is necessary, and the rich development of seeds shows that it is effective.

Pollination is effected in various ways in plants, among which the most important are the following: (1) Insect pollination. In a vast number, perhaps even the majority of plants, pollen is

transferred by insects. The structure of the insect-pollinated flowers is commonly more or less complicated and differs somewhat widely

FIG. 2. DIOECISM.

Catkins of the crack willow (*Salix fragilis*), the lower staminate, the upper pistillate. These catkins are borne on separate plants, thus insuring cross-pollination.

from that of flowers pollinated in other ways (Fig. 5). For example, the corollas are commonly prominent and highly colored, and it is be-

FIG. 3. DIMORPHISM.

Flowers of the *Houstonia*, illustrating *a* means for facilitating cross-pollination. In *a* the styles are long and the stamen filaments short; while in *b* the reverse is true. Pollen obtained from anthers on long stamens is likely to be brushed off upon the stigmas of the long styles; while pollen from the short stamens will be brushed off upon the stigmatic surface of the short styles.

lieved that insects are more likely to visit flowers if their corollas are colored. Some experiments, however, would seem to show that color may not serve conspicuously as an attraction. Many

flowers are attractive to insects because of their fragrance, which is a device to secure cross-pollination. The pollen of insect-pollinated flowers is often comparatively sticky and heavy. A large number of structures are found in these flowers which seem to favor certain insects and oppose others. Among the more striking of these devices

FIG. 4. PROTANDRY.

Flowers of a freeweed, showing a young condition (a), in which the stamens, but not the stigmas, are mature, and an older condition (b), in which the pollen has gone, while the stigmas are mature. Cross-pollination is thus effected.

is a long corolla tube which favors insects with a long proboscis. In general, insect-pollinated flowers are rich in nectar, which is often the lure for the visit of insects. Other flowers are visited for their pollen, of which many insects are fond. (2) Bird pollination. A comparatively small and in North America unimportant number of flowers are pollinated by birds, especially hum-

FIG. 5. INSECT POLLINATION.

The flower of a legume, showing the normal condition (a) and the condition which appears when an insect alights on the flower (b). It is obvious that insect pollination can be readily effected here.

ming-birds. (3) Wind pollination is common with a large number of plants, especially trees, grasses, and sedges, in which the flowers differ from insect-pollinated flowers in the relative absence of showiness, nectar, and odor, etc. These flowers are also comparatively small. The pollen is usually light, easily carried by the wind, and is also produced in immense quantities. Pine pollen is particularly interesting in that

it is winged (Fig. 6, a). It is so abundant that it sometimes forms the so-called sulphur showers. (4) Water-pollinated flowers. A small number

FIG. 6. POLLEN GRAINS.

(a), From the pine, showing bladder-like wings which facilitate dispersal, and (b), from the hibiscus showing spines which facilitate attachment to the stigma.

of aquatic plants are pollinated by means of water currents. In some cases, as in *Vallisneria*, a somewhat complex mechanism is present.

POLLIO, GAIUS ASINIUS. A Roman orator, politician, soldier, and author of considerable merit. He was born in Rome B.C. 76, but belonged to a family of Marrusian descent. When civil war broke out between Caesar and Pompeius, Pollio sided with the former, was present at the crossing of the Rubicon, and took part in the battle of Pharsalia B.C. 48. At the time of Caesar's assassination Pollio was governor of Further Spain, and carrying on the war against Sextus Pompeius. In the subsequent struggles he sided with the triumvirate against the oligarchic senate; and on the triumph of the former, was appointed administrator of Gallia Transpadana, in which capacity he saved the property of the poet Vergil at Mantua from confiscation. After Antonius and Octavianus had quarreled, it was Pollio who effected their temporary reconciliation at Brundisium B.C. 40; next year he conducted a successful campaign against the Parthini, a people of Illyria, and in consequence obtained a triumph. After this event, however, he withdrew altogether from political life. He lived far into the reign of the Emperor Augustus, dying at his Tusculan villa A.D. 4, in the 80th year of his age. Besides having a reputation for oratory, Pollio was celebrated as an historian, poet, and critic. His literary and political criticism of his contemporaries, in particular, appears to have been valuable. He also claims remembrance as a distinguished patron of Catullus, Horace, Vergil, and other men of letters, and as the founder of the first public library at Rome. Of the writings of Pollio, we possess only three letters to Cicero (published among Cicero's correspondence *Ad Familiares*, v. 31-33), and a few fragments of his *History of the Civil Wars* collected by Peter. *Historicorum Romanorum Fragmenta* (Leipzig, 1883). Wölflin would attribute to Pollio the *Bellum Africanum* (published with Caesar's works by Dinter, Leipzig, 1890), but this theory is not generally accepted. Consult: Landgraf.

Untersuchungen zu Cäsar und seinen Fortsetzern (Erlangen, 1888); Wöllflin and Miadoriski, *Pollionis de Bello Africo Commentarius* (Leipzig, 1889); Schmalz, *Ueber den Sprachgebrauch des Asinius Pollio* (Munich, 1890); Kornemann, *Die historische Schriftstellerei des Asinius Pollio* (Leipzig, 1896).

PÖLLNITZ, pölnits, KARL LUDWIG, Baron (1692-1775). A German memoirist of note. He was remarkable for his talents, but his extravagant and vagabond habits often reduced him to the greatest poverty. After wandering all over Europe, taking service in the Church in Austria, and in the army in Spain, he finally attracted the favorable notice of Frederick the Great, who appointed him his reader, and made him director of the theatre at Berlin. After twice having changed from Catholicism to Calvinism, he shortly before his death proclaimed himself a member of the Church of Rome. Among his works, marked by keen observation and wit, are *Lettres et mémoires* (1734) and *Etat abrégé de la cour de Saxe*, etc. (1734). He was probably also the author of *Histoire secrète de la duchesse d'Hanovre*, etc. (1732), and *La Saxe galante* (1734).

POLLOCK. See POLLACK.

POLLOCK, SIR CHARLES EDWARD (1823-97). An English jurist and law writer, educated at Saint Paul's School (1833-41). He was called to the bar in 1847, became Queen's counsel in 1866, and was knighted and raised to the Exchequer bench in 1873. Pollock collaborated with J. J. Lowndes, Sir Peter Maxwell, and F. P. Maude in the production of legal works, and wrote himself *The Practice of the County Courts* (1851), which he continued to supplement up to the edition of 1880, and *A Treatise on the Power of the Courts of Common Law to Compel the Production of Documents for Inspection* (1851).

POLLOCK, SIR FREDERICK (1845—). An English jurist and author. He was born in London, December 10, 1845, and was educated at Eton, and at Trinity College, Cambridge, of which he was made fellow (1868). Admitted to the bar at Lincoln's Inn (1871), he was appointed examiner in law at Cambridge (1879-81), professor of jurisprudence at University College, London (1882-83), Corpus professor of jurisprudence at Oxford (1883), professor of common law in the Inns of Court (1884-90), and member of the Royal Labor Commission (1891-94). His works pertaining to his profession comprise mainly *Principles of Contract* (1876; 7th ed. 1902); *Digest of the Law of Partnership* (1877; 7th ed. 1900); *The Land Laws* (1882, 3d ed. 1895); *The Law of Torts* (1887; 6th ed. 1901); *History of English Law* (1895; 2d ed. 1899), with Frederick William Maitland (q.v.); *A First Book of Jurisprudence* (1896). Better known to the general reader is *Spinoza, His Life and Philosophy* (1880; 2d ed. 1899). Further versatility is shown by *Introduction to the Science of Politics* (1890; 4th ed. 1902), and many brilliant political articles contributed to the *Pall Mall Gazette* and the *Saturday Review*. Sir Frederick Pollock also conceived the happy idea of writing verse-parodies of typical law cases. *Leading Cases Done into English* (1877), popular from the first, was reissued with additions in 1892; and in 1899, with Ella Fuller Maitland, he published *The*

Etchingham Letters, a clever novel in epistolary form.

POLLOCK, SIR GEORGE (1786-1872). A British soldier. He studied at the Royal Military Academy at Woolwich until 1803, and then entered the East India Company's service as a lieutenant of artillery. He arrived in India toward the end of the Mahratta wars, at once went to the front, and participated in the sieges of Deeg (November 12-December 25, 1804) and Blurtpore (January 4-April 2, 1805). During the First Burmese War he took an important part in the military operations, and at its close was invalided home. In 1838 he was promoted to be major-general, and in 1842 was assigned to command the British forces in the war against the Afghans. He forced the Khyber Pass and captured Kabul. For these services he received a pension of £1000 from the East India Company and many honors from the Indian and British governments. In 1870 he was commissioned field-marshal in the British Army, a year later was made constable of the Tower of London, and in 1872 was created Baronet of the Khyber Pass. Consult: Low, *Life of Field-Marshal Sir George Pollock* (London, 1873); and Kaye, *History of the War in Afghanistan in 1838 to 1842*.

POLLOCK, WALTER HERRIES (1850—). An English author. He was born in London in 1850 and was educated at Eton and at Trinity College, Cambridge, where he graduated with classical honors in 1871. Though called to the bar at Lincoln's Inn (1874), he early began to give most of his time to journalism and literature. From 1884 to 1894 he was editor of the *Saturday Review*. His work includes translations from the French, as well as much graceful and humorous verse: *Lectures on French Poets* (1879); *The Poet and the Muse*, a metrical translation from Alfred de Musset's *Nuits* (1880); *Songs and Rhymes, English and French* (1882); *The Picture's Secret*, a novel (1883); *The Paradox of Acting*, translated from Diderot (1883); *Verses of Two Tongues* (1884); *Old and New*, verse (1890); *A Nine Men's Morrice* (1889) and *King Zub* (1892), two volumes of fantastic tales; *Mémoires inédits du Marquis de——* (French, 1894); *The Charm, and Other Drawing-Room Plays*, in conjunction with Sir Walter Besant (1896); and *Jane Austen, Her Contemporaries and Herself* (1899).

POLLOK, ROBERT (c.1798-1827). A Scotch poet, son of a poor farmer. He was born at North Moorhouse, Renfrewshire, October 19, 1798; educated for the ministry at the University of Glasgow (M.A. 1822) and at the United Secession Hall (1822-27); licensed to preach (1827); but owing to poor health, caused in part by over study, he was never permanently in charge of a congregation. He was advised to visit Italy, but he got no farther than London, whence he went to Shirley Common, near Southampton, where he died, September 18, 1827. Pollok is remembered for *The Course of Time*, a poem, begun in 1825 and finished and published in 1827. Though suggested by Byron's *Darkness*, it is an essay in the manner of Milton. It is in blank verse, and its theme is the destiny of man. The poem was long popular in Scotland, England, and the United States. Pollok could not rise to his theme, and the execution as a whole is poor. The poem contains many eloquent passages not-

withstanding. Pollok also wrote a meditative poem called *Thoughts on Man*, and three tales of the Covenanters. Consult the *Life* by his brother, D. Pollok (Edinburgh, 1843).

POL/LOKSHAWS. A municipal borough and manufacturing town in Renfrewshire, Scotland, on the White Cart, three miles southwest of Glasgow, of which it is practically a suburban extension, connected by electric street railroads, etc. (Map: Scotland, D 4). Cotton-spinning, calico-printing, silk-weaving, bleaching, iron-founding, and fancy dyeing are extensively carried on. Population, in 1891, 10,223; in 1901, 11,169.

POLL-TAX. See CAPITATION, TAXATION.

POLLUTION OF WATERCOURSES (Lat. *pollutio*, from *polluere*, to defile, from *por-*, forth + *luere*, to wash). By the common law, owners of real property adjoining running streams are entitled to make a reasonable use of their waters, subject to the exercise of similar rights by owners above and below them on the stream. This right implies that they are entitled to the water in reasonable quantities and of a reasonable quality. As this doctrine of 'reasonable user' is applied, no absolute and definite rule can be framed as to what extent the waters of a stream can be polluted or contaminated by an adjoining owner. The courts will consider the circumstances of each particular case. As streams are natural means of drainage of land, it has been held that a city cannot be restrained from causing its sewage to flow into a stream, unless an unusual or unreasonable quantity is discharged therein. Mills and other industries along a stream naturally impair the quality of the water somewhat, but as a general rule the courts will "not interfere if they are adapted to the stream, and do not cause it to give off odors which are injurious to health." The discharge of dye materials, poisonous chemicals, unusual quantities of sawdust, and other waste into a stream, has been restrained in various jurisdictions.

The remedies of a riparian owner who is injured by pollution of a stream are to seek an injunction and damages in a court of equity, or sue for damages alone, in a court of law. See NUISANCE; RIPARIAN RIGHTS, etc. Consult: Angell, *The Law of Watercourses* (7th ed., Boston, 1877); Haworth, *River Pollution* (1897).

POLLUX. See CASTOR AND POLLUX.

POLLUX, JULIUS (Gk. Ἰούλιος Πολυδεύκης, *Ioulios Polydeukēs*). A Greek lexicographer who was born at Naucratis, in Egypt, and flourished in the reign of the Emperor Commodus (A.D. 180-192). After a preparatory training under his father, he studied under the Sophists, and became a learned grammatical critic. He opened a school of rhetoric at Athens, and became so famous that he was made preceptor of the Emperor Commodus. He prepared for the use of the Emperor an *Onomasticon*, a Greek vocabulary divided into 10 books, designed to facilitate the learning of the Greek language by the young prince. It contains a variety of synonymous words and phrases, is useful in the study of Greek literature and art, and is valuable also because in the first part it treats of the gods and their worship. Pollux was the author of several other works, of which Suidas has preserved the titles. The *Onomasticon* was published with Latin translation and commentary

by Dindorf (5 vols., Leipzig, 1825), and by Bekker (Berlin, 1846).

POLNISCH-OSTRAU, pól'nish ós'trou. A town in the Crownland of Silesia, Austria, on the Ostrawitza, opposite Mährisch-Ostrau, 60 miles west-southwest of Cracow. Its importance is due to the extensive coal deposits of the neighborhood, which form the southwestern part of the great Upper Silesia coal-belt. The town produces malt and liquors. Population, in 1890, 13,200; in 1900, 18,800; chiefly Czechs.

POLO (from Tibetan *pulu*, willow, the material of which the ball is made in Tibet). A game played on horseback, closely resembling hockey (q.v.). While the antiquity of polo in the East is undeniable, in England and America it is of comparatively recent origin. Persian odes, some of them thought to antedate the Christian Era, celebrate the glories of the game; and it is a matter of undoubted record that it has flourished at different courts of Central Asia from the tenth century. China and Japan also had a game closely resembling the Persian sport. The game seems to have been first adopted in India about 1764, by the English tea-planters in Cachar, from whom it spread to the English merchants of Calcutta. In 1869 some subaltern officers of the Tenth Hussars, stationed at Aldershot, introduced the game into England. The possibilities of the sport were immediately recognized, and at the present time the game is widely played in Great Britain and her colonies, and is almost as popular in the United States. The Hurlingham Club, London, became the acknowledged law-making authority, not only for Great Britain, but for her colonies. The executive, however, is the County Polo Association, which does not concern itself with rules, but regulates the principal contests, the County Cup Series, dividing England into four divisions, the winners only of which play in the finals at Hurlingham, where the Inter-Regimental Cups are also played for. The Champion Cup and the Hunt Cup Championship are played for over the course of the Ranelagh Club, another noted home of the game.

Polo was introduced into the United States in 1876 by James Gordon Bennett, and first practiced in Dikler's Riding Academy, New York City. The Westchester Polo Club was formed in New York City in the same year and a year later it went into summer quarters at Newport, R. I., which has been the American headquarters of the game ever since. The game went West as far as the Pacific coast, and a National Polo Association was organized, consisting of the principal Eastern clubs. Many other clubs exist, besides those affiliated with the association, especially in the Middle West and on the Pacific Slope.

The system of handicapping adopted by the American Polo Association is universally commended. In order to give younger players a chance, each individual is penalized with so many goals, from two upward, according to his skill. This penalty he takes with him wherever he plays. So that if the penalties on a team of four, each of whom is penalized, amount, say, to 16 goals, and they meet another team of four whose individual penalties aggregate only 10, the first team has to make 6 goals before it can begin to score. Of course this penal handicapping does not apply to championship and open games.

The rules of play adopted by the Westchester

Polo Club are those which practically govern all American play. They have been essentially the same all through the game; only minor alterations, like forbidding hooking mallets and raising the height of the ponies, first in 1879 from thirteen hands to fourteen one, and subsequently to fourteen two, having been made.

The game is played on a smoothly rolled green, when possible about 750 feet long and 500 wide. A white board ten inches high forms a boundary along the sides of the course, the ends being open, except that in the centre of each end there stand two goal posts 24 feet apart, made of very light material so as to break easily in case of collision. The ball is of basswood painted white, $3\frac{1}{8}$ inches in diameter, and weighs five ounces. The mallets or sticks are generally of Malacca cane, or other light wood, covered at the handle with rubber or leather, and from fifty to fifty-six inches long. The mallet head is generally cigar-shaped, two inches thick and eight or nine inches long, of strong wood, and fixed on the handle at any angle the player finds most effective to his wrist action. A loop of thin leather (to break easily) is slipped over the wrist, and the mallets weigh from 15 to 20 ounces. The ponies are not limited to any particular breed, but those that have been broken to the game give a great advantage to the players. They must be active, spirited, and sympathetic with the game. Each rider changes his pony with every period of play.

The game can be played by teams of two, three, or preferably four on each side. If two on each side play the periods are two of 15 minutes each, with two minutes' rest after each goal and five minutes between periods. Teams of three play four periods of 15 minutes; of four, four periods of 15 minutes each, with seven minutes' rest between them, and two minutes' rest after each goal.

Each team chooses an umpire, and they appoint a referee, who watches the game from a pony's back. The teams toss for position on the field. The eight players face each other in fours on the centre of the field. The captain usually takes the place of 'back' to defend his goal and direct his team. In front of him is the 'half-back,' while the two forwards (Nos. 1 and 2) are close up to the opposing team. Play begins as the referee throws the ball, or, in case it is decided to open the game with a charge, the teams are ordered back to within thirty feet of their respective goals, the ball is then dropped in the centre of the field, and at the sound of the time-keeper's gong all rush for a strike and the game is on. A player may not with his hands or stick touch an opponent or his horse or stick, nor must he put his stick over his opponent's horse. In 'riding off,' that is, eroding an opponent away from the ball, a player must not push or strike with his arm or elbow. When the ball goes out of bounds over the side line, it is thrown back at the point it crossed, the teams lining up as in the beginning of the game. When a ball crosses the end line, without passing between the goal posts, the side defending that goal has the privilege of a knock-out from the point at which the ball crossed the line. When a player knocks the ball behind the line, at the end at which his goal is situated, it is a safety knock-out, and scores $\frac{1}{4}$ of one goal against his side. If the ball is caromed out or kicked out by a pony it does not thus score. A player in

possession of the ball (he who hit it last) has the right of way, and must not be crossed except at a safe distance.

Polo is a rough, exciting game. The breaking of sticks and the unseating of riders is a frequent occurrence, and occasionally a pony has a bad fall. Fresh relays of ponies must be on hand at every game, as the sport is an exhausting one. It brings out, however, the natural instinct of the horse, who frequently seems to enter fully into the spirit of the contest.

POLO, pō'lō, GASPAR GIL (c.1530?-?). A Spanish poet, born at Valencia. While he was town clerk at his birthplace his talents for office became known to Philip II., who appointed him, in 1572, coadjutor to the president of the upper financial chamber of the Kingdom of Valencia, and in 1580 sent him to superintend the royal patrimony at Barcelona, where he died. Besides his *Canto de Turia* in praise of his native city, he wrote a continuation of Montemayor's *Diana*, under the title *Primera parte de Diana enamorada, cinco libros, que prosiguen los siete de Jorge Montemayor*. This work appeared first at Valencia in 1564. Though inferior to the original romance in invention, the continuation so greatly surpasses it in clearness of thought and expression throughout the metrical portions that Cervantes exempts it from the condemnation of Don Quixote's other books as deserving as much respect "as though Apollo himself had written it." The best edition of the *Diana enamorada* is that of Cerda, which is accompanied by a commentary on the *Canto de Turia* (Madrid, 1778; new ed. 1802; see also the edition in the *Biblioteca clásica española*, Barcelona, 1886). Polo's *Diana* was translated into English, along with the first part by Montemayor and the second by Alonzo Perez, by Bartholomew Young at London in 1583-92.

POLO, MARCO (c.1250-1324). The most celebrated traveler of the Middle Ages. He belonged to a noble Venetian family. His father, Niccolò Polo, and his uncle, Maffeo Polo, went about 1249 to the Crimea and from there journeyed to Cathay or China. Here they were received by the famous Kublai Khan (q.v.), returning home in 1269. When they set out again for the East in 1271 Marco Polo, who had been born during his father's absence, went with them. The three travelers crossed Western Asia and "Tartary," and reached China and the Great Khan in 1275. They were received with great honors, and young Marco received various high offices; at one time he administered a whole province for three years. The three Europeans finally became restless in this distant land, and, though the Khan was unwilling to allow them to depart, they at last obtained permission to accompany an embassy to Persia. From there they journeyed to Venice, reaching their native city in 1295. Marco Polo some time after his return commanded a fleet in a war against Genoa. He was taken prisoner in 1296, and was not released until 1298. During this time he dictated in French an account of his journey to Rustigliolo di Pisa, who entitled the work *The Book of Marco Polo*. It was translated almost immediately from the French text of Rustigliolo into many other languages. For centuries it comprised all the knowledge Europe possessed of the extreme East, and though Marco Polo was at one

time accused of exaggeration in many particulars, subsequent travels have proved the accuracy of his observations. Little is known of Polo's history after he left the Genoese prison, beyond the fact that a wife and three daughters survived him. Consult: San-Filippo, *Studi biografici e bibliografici*, vol. i. (Rome, 1882), which contains a list of the various editions; the best one is that of Yule, *The Book of Sir Marco Polo* (2d ed., London, 1875).

POLOCK, pól'ótsk. An ancient city of Russia. See POLOTSK.

POLO DE MEDINA, pól'ó dá má-dē'ná, SALVADOR JACINTO (c.1607-c.1660). A Spanish poet, born in Murcia. He took orders when about thirty years old, and became secretary to the Bishop of Lugo. He wrote much satirical verse in his youth in the manner of Cervantes and Quevedo. His *Academias del jardin*; *Buen humor de las musas Apolo y Dafne*, mostly poems; and *Pan y Siringa*, a romance, were all printed in 1630. His *Hospital de incurables, viaje de este mundo al otro* (1636), an imitation of Quevedo's *Sueños*, is in prose. He also wrote the elegant treatise *Gobierno moral a Lelio* (1657), which had considerable influence on the literature of his century. His *Obras en prosa y verso* were first published in 1664. His verse is printed in Rivadeneyra's *Biblioteca de autores españoles*, vol. xliii. (Madrid, 1875).

POLONAISE (Fr., Polish), or **POLACCA**. A Polish national dance of slow movement, in $\frac{3}{4}$ time. It always begins and terminates with a full bar, and a peculiar effect is produced by the position of its cadence, the dominant seventh in the second crotchet of the bar preceding the triad on the third crotchet:

The characteristic rhythmic figure of the accompaniment is . At the present

day the polonaise is more a promenade than a dance, taking the place of the older *entrée*. Grove claims that this dance was not originally a popular dance, but originated at the coronation of Henry of Anjou at Cracow (1574). This statement seems to be confirmed by the fact that the oldest polonaises were not dance-songs, but purely instrumental pieces. Moreover, the entire character of the polonaise seems to indicate that it might well have had its origin in the need of some suitable music to accompany the movements of a solemn procession. Chopin gave to the polonaise a new significance as an instrumental form. The characteristic features of the polacca are sometimes adopted in a rondo, or other lively and brilliant composition, which is then said to be written *alla polacca*.

POLONIUM (Neo-Lat., from Lat. *Polonia*, Pol. *Polska*, Poland). A metallic element discovered in 1898 by Madame Skłodowski Curie. While studying the radio-activity of various minerals, Madame Curie found that specimens of uraninite or pitchblende from certain localities showed more active radiation than metallic uranium, the principal metallic ingredient of uraninite. She thus became convinced that those minerals must contain some radio-active substance hitherto unknown, and further examina-

tion led her to the discovery of a new radio-active metal, resembling bismuth, for which she proposed the name *polonium*. At first the elementary nature of polonium was questioned, and it was said to be a mixture of bismuth and some unknown substance; but the more recent researches of Markwald, of Berlin, have demonstrated it to be an element. The properties of polonium are said to be similar to those of bismuth, although the metal resembles nickel in color. The subnitrate of polonium has been prepared, and is a whitish powder. The special peculiarity of polonium is its wonderful radio-activity, which is said to be about three hundred times greater than that of uranium. Markwald has shown that polonium intercepts a strong current of electricity passing through the air from a generator to the receiver, the air ceasing to be a conductor for the flashes; and that in the dark pieces of barium, platinum, and zinc sulphide, if placed near polonium, glow with a bright greenish light. See RADIO-ACTIVITY.

POLONIUS. The chamberlain to the King of Denmark, and father of Ophelia and Laertes, in Shakespeare's *Hamlet*. Hidden behind the arras to overhear Hamlet and the Queen, he is killed by the former, who thinks it is the King.

POLOTSK, pól'ótsk, or **POLOCK**. An ancient city of the Government of Vitebsk, Russia, situated on the Dūna, 63 miles northwest of Vitebsk (Map: Russia, C 3). Its two ancient castles are now in ruins and a new church stands on the site of the Church of Saint Sophia originally founded in the twelfth century. There is a seminary for teachers. The chief manufactures are leather, pottery, tobacco, soap, and candles. Population, in 1897, 20,750, about 50 per cent. Jewish. Polotsk was the capital of a mediæval principality, which was absorbed by Lithuania. In the sixteenth century it was a prosperous and splendid city, but it was subsequently ruined by war and plague. It was taken by Russia in the first partition of Poland in 1772. It was the scene of severe conflicts between the Russians and the French during the Napoleonic invasion of Russia in 1812.

POLTAVA, pól-tá'vá, or **PULTOWA**, pul-tá-vá. A government of Little Russia, bounded by the Government of Tchernigov on the north, Kharkov on the east, Ekaterinoslav and Kher-son on the south, and Kiev on the west (Map: Russia, D 5). Area, about 19,090 square miles. The surface is undulating, slightly elevated in the north, and with a general incline toward the valley of the Dnieper in the southwest. It belongs to the basin of the Dnieper, by which river it is skirted on the southwest. The climate is moderate and steady, the annual temperature at Poltava, the capital, averaging about 46°. Poltava belongs to the black-soil region of European Russia and is one of the chief grain-producing districts of the Empire. Agriculture is the principal occupation and is carried on on very primitive lines, modern machinery and fertilizers being confined principally to large estates. The leading products are rye, oats, and wheat. They are raised in quantities far above the domestic demand. The sunflower and flaxseed are cultivated for the production of oil, and tobacco-raising is important. The vegetables of Poltava, especially the melons, are famous all over Russia. Stock-raising, especially the breeding of

horned cattle, is of great importance, since oxen are used chiefly as draught animals and for agricultural purposes.

The government has few manufacturing industries, and they are connected with agriculture or gardening. The principal manufactures are flour, oil, tobacco, sugar, spirits, etc. Population, in 1897, 2,794,727, over 95 per cent. Little Russians, Jews, Poles, and Germans. Capital, Poltava. The Russians began to settle in the region in the tenth century, but their settlements were destroyed during the Mongol invasion and the territory was taken possession of by Lithuania in the fourteenth century. Later it passed to Poland. By the Andrussovo Treaty (1667) it fell to Russia. The present government was formed in 1802.

POLTAVA, or **PULTOWA**. The capital of the government of the same name, Little Russia, on the Vorskla River, about 70 miles southwest of Kharkov (Map: Russia, D 5). Outside of the town is situated a monastery dating from 1650. Near it is the monument commemorating the victory of the Russians over the Swedes, and known as the Swedish Tomb. The educational institutions of the town comprise two gymnasia, a real-school, a cadet corps, an institute for daughters of noblemen, a seminary for priests, and a number of Jewish schools. Industrially the town is only of slight importance, and its fairs have practically lost their former significance. Population, in 1897, 53,060, including a considerable number of Jews. Poltava is famous as the scene of the signal victory of the Russians under Peter the Great over the Swedes under Charles XII., on July 8, 1709.

POLYÆNUS (Lat., from Gk. Πολύαινος, *Polyainos*) (c.85-c.170). A Greek rhetorician of the second century. He was born in Macedonia, lived in Rome, and about 163 wrote in Greek a work entitled *Stratagemata*. Of its eight books, two are lost. The sources also are mostly gone, so that the work contains much historical information for which there is no other authority. It was edited by Casaubon (1589) and by Wölfflin (1887).

POLYANDRY (from Gk. πολυανδρία, *polyandria*, populousness, from *πολύανδρος*, *polyandros*, having many men, from *πολύς*, *polys*, much, many + *άνήρ*, *anēr*, man). That form of marriage and the family in which a woman has more than one husband at a time. There are two well-marked types of polyandry, in one of which, called Nair polyandry, the husbands are usually not related to one another, and the Tibetan, or fraternal polyandry, in which the husbands are brothers. Either of these forms may shade into a relationship which would have to be described as a combination of polyandry and polygyny, each husband having more than one wife, as each wife has more than one husband. A family scheme similar to this existed in the Hawaiian Islands when they first became known to Europeans, and was there known as the Punaluan family, and this name has been adopted into ethnology. In one or another form polyandry has been widely distributed. It has only lately disappeared from Ceylon, New Zealand, New Caledonia, and elsewhere in the Pacific islands. It is still found in the Aleutian Islands, among the Koryaks north of the Okhotsk, and among the Zaporogian Cossacks. In Africa it is found

among the Hottentots, among the Damaras, and among mountain tribes of the Bantu race, and traces of it remain among the Hovas of Madagascar. Cæsar notes its existence in his day among the Piets and the Irish, and many evidences of its former occasional existence in other Aryan stocks and throughout the Semitic and the Hamitic races have been brought together by McLennan, Spencer, and W. Robertson Smith.

The studies of McLennan led him to the conclusion that polyandry, originating in poverty and female infanticide, was the first form of marriage, in a true sense of the word. (See MARRIAGE.) Westermarek and Crawley among influential writers have disputed McLennan's theories, but the investigations of Spencer and Gillen among the native tribes of Central Australia have tended to confirm them in some important particulars. Apparently the earliest relations of men and women in primitive hordes were such that in a nominal sense all women were wives of all men, but that, so far from actual promiscuity being the practice, a temporary mating was usual. That this arrangement was not in fact exclusive of polyandry, as Westermarek has regarded it, is shown by Australian customs, where a wife who consorts with the elder of two or more brothers so long as he is present in camp consorts with a younger brother during the absence of the elder. It is impossible to say with certainty whether the Nair polyandry of Southern India or the Tibetan polyandry is the older. Probably the Punaluan relationship preceded the polyandry in which one woman is shared by two or more men without any corresponding polygyny, and, if so, fraternal polyandry is older than that in which husbands are unrelated. The Jewish custom of the Levirate, or obligation to marry a brother's widow, has been regarded as a survival of polyandry, but, as Spencer has shown (*Principles of Sociology*), it admits of another explanation. For bibliography, see MARRIAGE.

POLYANTHUS (Neo-Lat., from Gk. πολυανθος, having many flowers, from *πολύς*, *polys*, much, many + *άνθος*, *anthos*, flower). A hardy perennial plant—often called garden polyanthus—much prized and cultivated in gardens. It has been developed from *Primula variabilis*, which itself is a hybrid between the common primrose (*Primula vulgaris*) and the English cowslip (*Primula officinalis*). The numerous flowers are borne above the foliage in an umbel supported on a common leafless flower stem, or scape. It exhibits a great variety of delicate and beautiful colors. The varieties are innumerable. If a particular color is to be preserved the plants are propagated by divisions. A rich soil, shade, and moisture are most suitable.

POLYBIUS (Lat., from Gk. Πολύβιος) (c.205-c.120 B.C.). The chief Greek historian of the Hellenistic period. He was born at Megalopolis, in Arcadia, and was the son of Lycortas, a general of the Achæan League and an intimate friend of Philipæmen. His birth and great talent early secured him important political positions in his native city. In B.C. 181 he was chosen as member of the embassy which was to visit Alexandria, but which was afterwards given up; and in 169 he held the office of hipparch in the Achæan League. After the conquest of Macedonia in 168, he was one of the thousand noble and influential Achæans who were taken to Rome as hostages.

There he remained seventeen years. Through some good fortune he soon gained the friendship of Æmilius Paulus and his sons, with whom he resided during a large portion of his exile. The young Scipio Æmilianus became strongly attached to him and took him as companion on his journeys in Northern Italy and also in his military expeditions against the Celtiberians in Spain. In 150, together with his fellow-exiles, he was allowed to return to his home, but during the Third Punic War he rejoined Scipio, accompanied him on his African campaign, and was present at the destruction of Carthage in 146. The outbreak of war between the Achæans and Romans called him again to Greece, where he was of the greatest service through his influence with the Romans in procuring favorable terms for the vanquished. So grateful were his countrymen for his services, in their behalf that Megalopolis, Mantinea, and many other towns erected statues in his honor. It is said that he met his death by a fall from a horse.

Polybius's chief work is his *Histories* in 40 books, of which the first five have come down to us complete; we also have considerable portions of the first 18 books, preserved in a codex of Urbino and also the important excerpts of Constantinus Porphyrogenitus. The subject of this history was the gradual extension of the Roman Empire from B.C. 266. Polybius devoted the first two books of his work to an introductory sketch of Rome and Carthage from 266 to 221. From this point it is a general history of the times, including the important events in Greece, Asia, and Libya, as well as in the West. The history to 168 B.C. occupied books 3-30, while the last ten books brought the history down to the year 146. Polybius seems to have begun his work as early as 150, and the composition of it apparently extended over some 25 years.

Polybius is the first great example of a writer of history on the pragmatic method. He endeavored not simply to present facts, but also to ascertain the causes of these facts, and to draw from them lessons valuable for the future. On the other hand, his tone is too didactic in general, and the continuity of his narrative is too often interrupted by digressions. His style is clear, but without grace or charm; he incurred the censure of later Greek critics for carelessness in the choice of words and in the structure of sentences. His work, however, marked an epoch in the history of Greek literary style, for with it begins the period of the so-called 'common' dialect, a slightly modified Attic. The best annotated edition is by Schweighäuser in 8 vols. (Leipzig, 1789-95); critical editions by Bekker (Berlin, 1844), Dindorf (last edition, Leipzig, 1882-89), and also by Hultsch (2d ed., ib., 1888; English translation by Shuckburgh, London, 1889). Consult: Scala, *Die Studien des Polybius* (Leipzig, 1890); Cuntz, *Polybius und sein Werk* (ib., 1902).

POLYBOTES (Lat., from Gk. Πολυβώτης). A giant pursued by Poseidon after the struggle with the gods, and buried under a portion of the island of Cos, which Poseidon tore away and hurled upon him.

POLYBUS (Lat., from Gk. Πόλυβος). A king of Corinth and foster-father of Ædipus (q.v.).

POLYCARP (Lat. *Polycarpus*, from Gk. Πολύκαρπος, *Polykarpos*) (c.69-155). Bishop of

Smyrna and one of the most celebrated early Christian martyrs. Such meagre information as we have about his life is drawn chiefly from Irenæus, Eusebius, and the anonymous *Martyrdom of Polycarp*. As a youth he came in contact with the Apostle John, and thus he constitutes an important link between him and Irenæus (q.v.). When Ignatius passed through Asia Minor on his way to death in Rome early in the second century, he visited Polycarp, then already Bishop of Smyrna, and to him he afterwards addressed a letter. (See *IGNATIUS OF ANTIOCH.*) So far as we know, most of Polycarp's life was passed in the peaceful administration of his see. One of his last acts was to visit Anicetus, Bishop of Rome, to confer with him respecting the time of celebrating Easter (q.v.). Soon after his return to Smyrna Polycarp was arrested by the officers of the Roman Government, tried on the charge of being a Christian, and condemned to death by burning. He suffered martyrdom on February 23, 155 (not 166, as was formerly supposed), at the advanced age of eighty-six years, and perhaps older. Such was the sanctity of his life and such his heroism in martyrdom, that his memory and his relics were always held in the deepest veneration. Polycarp is said to have written several letters, only one of which, however, that to the Philippians, has come down to us. Its authenticity has been doubted, but on insufficient grounds. The Epistle is extant partly in the original Greek, and as a whole in a loose Latin translation. The *Martyrdom of Polycarp* is an early document, giving a probably authentic account of his trial and death. Both these works are included among the Apostolic Fathers, and may be read, in English translation, in Harmer's one-volume edition of Lightfoot's *Apostolic Fathers* (London, 1898). Consult: Lightfoot, *The Apostolic Fathers*, part ii., *Ignatius and Polycarp* (2d ed., London, 1889); Cruttwell, *Literary History of Early Christianity* (London, 1893); Funk, *Patres Apostolici* (Tübingen, 1901); Harnack, *Chronologie der altchristlichen Litteratur* (Leipzig, 1897).

POLYCHROME BIBLE (from Gk. πολύχρωμος, *polychromos*, many-colored, from πολυς, *polys*, much, many + χρώμα, *chrōma*, color). An edition of the books of the Old Testament printed in different colors, to show the various literary sources represented; according to the view of modern scholars. The series has been issued in both Hebrew and English under the general editorship of Prof. Paul Haupt of Johns Hopkins University, with the help of some of the foremost scholars of Europe and America.

POLYCHRONICON (Neo-Lat., from Gk. πολύς, *polys*, much, many + χρονικός, *chronikos*, relating to time, from χρόνος, *chronos*, time). A history of the world from the creation down to the year 1342 by Ranulf Higden, a Benedictine monk, who died about 1363. It was very popular as late as the fifteenth and sixteenth centuries.

POLYCLITUS (Lat., from Gk. Πολύκλειτος, *Polykleitos*). A Greek sculptor in bronze. He is called by Plato and other ancient writers an Argive, and was certainly the representative of that school in Greek art. The only authority for his birth at Sicyon is Pliny, who seems to have drawn on a history by a Sicyonian, who claimed for his native city the honor of the greatest Argive artist. The only certain date in his life

is that of the great chryselephantine statue of Hera at Argos, which was erected in the new temple built in place of the sanctuary burned in *n.c.* 433. The new temple was built at once, and the statue can scarcely be much later than *n.c.* 420. It is possible that the statue of Zeus Meilichios at Argos was a later work, and the Amazon of Ephesus, which seems to belong with similar statues by Phidias, Cresilas, and Phradmon, is probably a work of about *n.c.* 440. The general character of his Doryphorus (or Spear-bearer) also indicates a date not long after the middle of the fifth century. This evidence agrees well with the ancient statements that Polyclitus was a younger contemporary of Phidias. That he was a pupil of Ageladas, the founder of the Argive school, is very doubtful on chronological grounds. In technical skill, delicacy of finish, and beauty of line he ranked with the greatest artists of his time, but ancient critics missed in his works the sublimity which marked the statues of Phidias. He followed in the lines already characteristic of the Peloponnesian school. His figures are marked by a powerful muscular frame, rather thick-set in proportion to the height, while the face is rather square than oval, with broad brow, straight nose, and small chin, with the lines sharply defined, presenting a somewhat striking contrast to the fine oval which is characteristic of the Attic school. A careful student of proportions, Polyclitus embodied his theories not only in writing (if this is the meaning of the canon attributed to him), but in his statues, and especially in the Doryphorus, of which the best marble copy is in Naples, while the head is represented in a bronze bust from Pompeii. Of the same character, but softer in its lines, is the Diadumenos, or youth binding a fillet round his brow, which is preserved in several marble replicas, of which the best was found in a private house on the island of Delos. His Amazon is almost certainly reproduced in the marble of Berlin, and his strongly marked characteristics in form and pose render it possible to attribute to him or his school the originals of a number of other works. A younger Polyclitus, possibly a nephew of the great sculptor, flourished in the next century, and enjoyed a high reputation not only as a sculptor, but likewise as an architect. He built the theatre in the sanctuary of Aesclepius at Epidaurus, greatly and justly famed for the beauty of its proportions, and the Tholos, or circular building, of which the use is uncertain, at the same place.

Consult the histories of Greek sculpture cited under GREEK ART; Furtwängler, *Masterpieces of Greek Sculpture*, translated by E. Sellers (London and New York, 1895); Mähler, *Polyklet und seine Schule* (Leipzig, 1902).

POLYCRATES (Lat., from Gk. Πολυκράτης, *Polykrates*). A tyrant of Samos, born in the first part of the sixth century. Nothing is known of him until about *n.c.* 535, when with the assistance of his brothers, Pantagnotus and Syloson, and a small band of conspirators, he seized the government of the island. After a short time Polyocrates made himself sole despot, conquered several islands of the archipelago, and even some towns on the Asiatic mainland, waged war successfully against the inhabitants of Miletus, and defeated their allies, the Lesbians, in a great sea-fight. His fleet, which was probably the most powerful in all Greece, amounted to

one hundred armed ships, and he had a force of 1000 mercenary bowmen. He was in intimate alliance with Amasis, King of Egypt, but this was ultimately broken off—according to Herodotus, by Amasis, who became alarmed at the uninterrupted good fortune of Polyocrates. He is reported to have written a letter to Polyocrates, earnestly advising him to throw away the possession that he deemed most valuable, and thereby avert the displeasure of the envious gods. Polyocrates, in compliance with this advice, cast a signet-ring of marvelously beautiful workmanship into the sea; but a fisherman presented the tyrant with an unusually big fish that he had caught, and in its belly was found this same ring. It was quite clear to Amasis now that Polyocrates was a doomed man, and he immediately broke off their alliance. Grote suggests that Polyocrates, with characteristic perfidy, abandoned the Egyptian for a Persian alliance when he found the latter likely to be of more value to him in his ambitious designs. When Cambyzes invaded Egypt (*n.c.* 525) Polyocrates sent him a contingent of 40 ships, in which he placed all the Samians disaffected toward his tyranny, telling the Persian King not to let them come back. They escaped in some way or other the fate which Polyocrates had designed for them, returned to Samos, and made war against the tyrant, but without success. Hereupon, they went to Sparta and succeeded in securing the help of both the Spartans and Corinthians. A triple force of Samians, Spartans, and Corinthians embarked for Samos, and attacked the capital. After vainly besieging it for forty days they sailed away, and Polyocrates now became more powerful than ever. But a certain Oroetes, Persian satrap of Sardis, had, for unknown reasons, conceived a deadly hatred against Polyocrates, and having, by appealing to his cupidity, enticed the latter to visit him, he seized and crucified him, about *b.c.* 522. Polyocrates was a patron of literature and the fine arts, and had many poets and artists about his Court, among the former being Anacreon.

POLYD'AMAS (Lat., from Gk. Πολυδάμας). (1) One of the Trojan heroes, son of Panthous, and friend of Hector. (2) A Thessalian victor in the Paneraticum in the Olympic games of *b.c.* 408, noted for his size and enormous strength, which caused him to be invited to the Court of Darius Ochus.

POLYDEC'TES (Lat., from Gk. Πολυδέκτης, *Polydektēs*). The son of the King of the island of Seriphus, turned into a stone by Perseus with the head of Medusa for attempting to force Danaë to marry him.

POLYDEU'CES. See CASTOR AND POLLUX.

POLYDIPSIA (Neo-Lat., from Gk. πολυδίψιος, *polydipsios*, very thirsty, from *πόλις*, *polys*, much, many + *δίψα*, *dipsa*, thirst). Excessive thirst is a symptom of most diseases attended by a high temperature, but particularly of diabetes mellitus and insipidus, which are characterized by a constant desire for drink. On this account the insipid form has been called polydipsia, although the term is no longer used in this sense. In diseases attended with profuse watery discharges from the bowels, as cholera Asiatica, excessive thirst is a prominent symptom, and an unusual desire for fluids is common in chronic gastritis and cancer of the stomach. See DIABETES.

POLYCLITUS AND PRAXITELES

1. HEAD OF THE DORYPHORUS. Copy in Bronze, Naples Museum.
2. AMAZON OF POLYCLITUS, Copy in Marble, Berlin Museum.
3. UPPER PORTION OF THE HERMES OF PRAXITELES, Original, Marble, Olympia Museum.
4. UPPER PORTION OF THE FAUN OF PRAXITELES, from the Capitoline Museum, Rome.

POLYDORE. (1) The name assumed by Guiderius in Shakespeare's *Cymbeline*. (2) The brother-in-law of Monimia in Otway's tragedy *The Orphan*, who personated her husband on her wedding night, and killed himself on discovering her secret marriage.

POLYEUCTE, pó'lé-ékt'. (1) A tragedy in five acts by Corneille, published with a dedication to Anne of Austria in 1642. Polyucte is the husband of Pauline, daughter of the Roman proconsul Felix, who is commissioned to persecute the Christians, and is forced to put his son-in-law to death, in spite of his daughter's pleadings. Pauline, after her husband's martyrdom, is converted to his faith, and in turn influences Felix to embrace Christianity. The character of Pauline is one of Corneille's finest creations. (2) An opera in five acts by Gounod (1878) with libretto by Barbier and Carré.

POLYG'ALA (Lat., from Gk. πολύγαλον, *polygalon*, milkwort, from πολίς, *polys*, much, many + γάλα, *gala*, milk). A large genus of annual and

perennial herbs and small shrubs of the natural order Polygalaceæ, natives chiefly of warm and temperate climates. *Polygala vulgaris*, common milkwort, is a small perennial plant, with an ascending stem, linear-lanceolate leaves, and terminal racemes of small but beautiful blue, pink, or white flowers, having a finely crested keel. It grows in dry hilly pastures. Many species are natives of North America. *Polygala Senega* is a North American species with erect, simple, tufted stems, about one foot high, and terminal racemes of small white flowers. The root, which is woody, branched, contorted, and about half an inch in diameter, is the senega-root, seneka-root, or snake-root of the United States, famous as an imaginary cure for snake-bites. *Polygala crotalaroides* is similarly employed in the Himalayas. In the United States the roots of *Polygala alba*, *Polygala Boykinii*, and others which are

SENECA SNAKEROOT (*Polygala Senega*).

considered inferior as drugs to *Polygala Senega* are often collected and mixed with that species. The bark of the roots of *Monnina polystacha* and *Monnina salicifolia* is used in Peru as a substitute for soap.

POLYGAMY (from Gk. πολυγαμία, *polygamia*, plural marriage, from πολύγαμος, *polygamos*, much married, from πολίς, *polys*, much, many + γάμος, *gamos*, marriage). That form of marriage and the family in which a man has two or more wives. Strictly speaking, polygamy, meaning plural marriage, includes polyandry (more than one husband) as well as polygyny (more than one wife). Polygyny is found in all climes and among all races: Fuegians, Australians, Negritos, the Malayo-Polynesians, American Indians, and peoples of Africa. It flourishes in China and in Turkey, and in former ages it prevailed among the peoples of Western Asia. It seems not to have been practiced to any extent by Greeks or Romans, and its occurrence among Celts and Germans was occasional. Tacitus says of the Germans of his day that "almost alone among barbarians" they "are content with one wife;" but he notes a few exceptions of noble birth. Polygamy has never been the only family form in any tribe or nation. Usually it has been only the relatively well-to-do and the powerful that have maintained polygamous families, while the majority of men and women have commonly lived in monogamous relations, the very poor resorting at times to polyandry. Under some conditions polygamy has been favored on economic grounds. Where a simple agricultural industry is carried on by women, as in parts of Africa and of North America, the possession of many wives may mean not mere luxurious expenditure, but increase of productive power. Ancestor worship was favorable to polygamy because failure of the first wife to bear sons was equivalent to bringing the supreme purpose of the family to naught. The line of the family priesthood was broken. In other ways also the religious sanction has been appealed to. The Mormons, for example, have regarded the multiplication of offspring as the supreme duty. See MARRIAGE.

POLYGLOT (ML. *polyglottus*, from Gk. πολύγλωττος, *polyglōttos*, πολύγλωσσος, *polyglōssos*, speaking many tongues, from πολίς, *polys*, much, many + γλῶττα, *glōtta*, γλῶσσα, *glōssa*, tongue, language). A book containing the same subject matter in more than one language, generally arranged for convenience in parallel columns. Of such books editions of the Bible are most common, and are generally meant by the term polyglot. Various versions of the Hebrew Old Testament (such as the *Hexapla* of Origen, q.v.) and the Greek New Testament were united for convenience at various times. Using the term strictly, there are four great polyglots: (1) The *Complutensian Polyglot*, in six folio volumes, begun in 1502, printed from 1513 to 1517 at Alcalá de Henarez (the Roman Complutum, whence the name Complutensian), Spain, and published under Papal permission in 1520. Famous Spanish scholars edited the work, which was under the general oversight of Cardinal Ximenes. This polyglot contains the Old Testament in Hebrew, the Targum of Onkelos on the Pentateuch, the Septuagint, the Vulgate, and the Greek New Testament. Six hundred copies were printed. (2) The *Antwerp Polyglot*, *Biblia Regia*, issued from the famous Plantin printing house in Antwerp. This was prepared under Spanish auspices also, Philip II. bearing the cost and sending the scholar Arias Montanus to Antwerp to edit it. It is in eight folio volumes, appeared from 1569 to 1572, and contains the Hebrew and Greek of

the Old Testament, the Targum of Onkelos, and other Aramaic paraphrases, the Vulgate, and the Greek and a Syriac version of the New Testament. It is of no special value for purposes of historical criticism, and is rare now owing to the early loss of a great many copies by accident. (3) The *Paris Polyglot*, in ten great folio volumes, issued between 1628 and 1645 in Paris by Antoine Vitré at the expense of Guy Michel le Jay. Its critical value is very slight. It presents the Samaritan Pentateuch, another Syriac, and an Arabic version of the Old Testament, in addition to the material contained in the Antwerp volumes. (4) The *London or Walton's Polyglot*, published in six folio volumes, from 1654 to 1657, under the editorship of Brian Walton. The first copies were dedicated to Oliver Cromwell, who had been personally interested in their publication and had allowed the paper on which they were printed to be imported without duty. The second set was dedicated to King Charles II. and the former patron, Cromwell, is branded as 'the great Dragon.' It contains the entire Bible, or some portion of it, in Hebrew, Samaritan, Aramaic, Syriac, Arabic, Ethiopic, Persian, Greek (with a literal Latin translation of each), and Latin. This is the most valuable polyglot ever issued. The greatest scholars worked upon it, and Walton's *Prolegomena* is a very able work which has been republished (Canterbury, 1828). A dictionary of all the languages represented except the Greek and Latin, called *Lexicon Heptaglotton*, was published by Edmund Cartell in 1669. Of minor polyglots mention may be made of *Bagster's* (London, 1831), which contains the entire Bible in Hebrew, Greek, English, Latin, French, Italian, Spanish, and German, with a Syriac version of the New Testament in addition. Consult Tregelles, *An Account of the Printed Text of the Greek New Testament* (London, 1854).

POLYGNŌTUS (Lat., from Gk. Πολύγνωνος). A distinguished Greek painter of the second quarter of the fifth century B.C. He was the son of Aglaophon, and a native of the island of Thasos, where his family were artists. He seems to have come to Athens shortly after the Persian wars, and found abundant scope for his talents in the decoration of the great buildings which mark this period. Along with the Ionian Micon, and Pananos, brother of Phidias, he is said to have decorated the Theseum, Stoa Pæcile (or painted portico), and Anakeion, or temple of the Dioscuri, with paintings from legend and recent history, though the division of the paintings among the artists was not certain. The first building contained the battles of the Athenians with the

Theseus with the Amazons, the battle of Marathon, and the victory of the Athenians and Argives over the Spartans at (Enoe, of which the second was by some attributed to Polygnotus. In the Anakeion he painted the Dioscuri carrying off the daughters of Leucippus. In the temple of Athena Areia at Plataea was a painting by him representing the slaughter of the suitors by Odysseus, and some frescoes in the Propylæa at Athens were attributed to him. Most celebrated and best known from the descriptions by Pausanias are the great paintings in the Lesehe (or porch) at Delphi, representing the departure of the Greeks from Troy and the descent of Odysseus to the lower world. As is clear from these subjects, Polygnotus devoted himself to extensive compositions containing many figures whose grouping and characterization required careful study. At the same time his means were simple. Black, white, red, yellow, blue, and green were his colors, light and shade were unknown, and the strength of the artist lay in his beauty of outline and coloring, and above all in his delineation of character. His subjects led him to arrange his figures on various levels, and for this reason he chose when possible sloping ground, which could be easily indicated by waving lines and the partial concealment of some figures. His influence was very marked not only on painting, as is clear from a group of Attic vases, but also on sculpture, and it is probable that the reliefs at Tryso (Gyöl-bashi) reflect his art, or that of the Ionian school, of which he was the greatest exponent.

Consult Brunn, *Geschichte der griechischen Künstler* (Stuttgart, 1853-59). The earlier works on the paintings of Polygnotus, though of some value, are in general superseded by later investigations, especially those of Robert, Schöne, Schreiber, and Weizsäcker: Robert, *Die Nekyia des Polygnot* (Halle, 1892); *Die Iliupersis des Polygnot* (ib., 1893); *Die Marathonschlacht in der Poikile und Weiteres über Polygnot* (ib., 1895); Schöne, "Zur Polygnots delphischen Bildern," in *Jahrbuch des archäologischen Instituts* (Berlin, 1893); Schreiber, *Die Wandbilder des Polygnot in Delphi* (Leipzig, 1897); Weizsäcker, *Polygnot's Gemälde in der Lesche der Knidier in Delphi* (Stuttgart, 1895). For reconstructions, see Robert, and *Wiener Vorlegeblätter* (Vienna, 1888).

POLYGON (Lat. *polygonum*, from Gk. πολύγωνον, *polygōnon*, polygon, neu. sg. of πολύγωνος, *polygōnos*, having many angles, from πολύς, *polys*, much, many + γωνία, *gōnia*, angle). If the two end-points of a broken line coincide, the figure ob-

CONVEX.

CONCAVE.

CROSS

Amazons, and of the Lapithæ with the Centaurs, and the descent of Theseus to Amphitrite in the depths of the sea. In the Stoa were represented the capture of Troy and the council of the Greeks to judge Ajax for his outrage on Cassandra, which was certainly by Polygnotus, also the bat-

tained is called a *polygon*, and the broken line its *perimeter*. The vertices of the angles made by the various segments of the perimeter are called the *vertices* of the polygon, and the segments themselves the *sides* of the polygon. The perimeter of a polygon divides the plane into two

parts, one finite (the part inclosed), the other infinite. The finite part is called the surface of the polygon, or for brevity simply the polygon. A polygon is said to be *convex* when no side produced cuts the surface of the polygon, *concave* when a side produced cuts the surface of the polygon, and *cross* when the perimeter crosses it-

A GENERAL QUADRILATERAL.

equals $(n - 2)$ straight angles. The sum of the exterior angles equals a perigon, or 360° . In concave polygons certain exterior angles lie inside of the polygon and are taken as negative according to the principle of continuity. The number of diagonals of a simple convex polygon is $\frac{n(n-3)}{2}$, n being the number of sides. If a

polygon of an even number of sides be circumscribed about a circle, the sums of its even and odd sides are equal; and if a polygon of an even number of sides be inscribed in a circle, the sums of its even and odd angles are equal. The inscription and circumscription of regular polygons depend upon the partition of the perigon. Thus to inscribe an equilateral triangle in a circle depends upon trisecting the circumference, hence the perigon at the centre. It was known as early as Euclid's time that the perigon could be divided into $2^n, 3 \cdot 2^n, 5 \cdot 2^n, 15 \cdot 2^n$ equal angles, and no other partitions were deemed possible by the use of the straight edge and compasses. But in 1796 Gauss found, and published the fact in 1801, that a perigon could also be divided into $17 \cdot 2^n$ equal angles; furthermore, that it could be divided into $2^m + 1$ equal angles if $2^m + 1$ represents a prime number; and, in general, that it could be divided into a number of equal angles represented by the product of different prime numbers of the form $2^m + 1$. Hence it follows that a perigon can be divided into a number of equal angles represented by the product of 2^n and one or more different prime numbers of the form $2^m + 1$. It is shown in the theory of numbers that if $2^m + 1$ is prime, m must equal 2^p ; hence the general form for the prime numbers mentioned is $2^{2^p} + 1$. Elementary geometry is thus limited to the inscription and circumscription of the regular polygons mentioned. Consult Klein's *Famous Problems of Elementary Geometry* (American edition, Boston, 1897).

self. The word polygon, in elementary geometry, is understood to refer to a polygon that is not cross unless the contrary is stated. If all of the sides of a polygon are indefinitely produced, the figure is called a *general* polygon. If a polygon is both equiangular and equilateral it is said to be *regular*. A polygon is called a tri-

angle, quadrilateral, pentagon, hexagon, heptagon, octagon, nonagon, decagon. . .dodecagon. . . pentadecagon. . . n -gon, according as it has 3, 4, 5, 6, 7, 8, 9, 10, . . .15, . . . n sides.

According to the principle of continuity (q.v.) polygons may be regarded as positive or as negative. E.g. consider the triangle ABC, which is, in general, regarded as positive. If C moves down

POL'YGONA'CEÆ (Neo-Lat. nom. pl., from Lat. *polygonum*, from Gk. *πολύγωνον*, knot-grass, polygony, neu. sg. of *πολύγωνος*, *polygonos*, prolific, from *πολύς*, *polys*, much, many + *γόνος*, *gonos*, seed). THE BUCKWHEAT FAMILY. A natural order of about 30 genera and 750 species of widely distributed dicotyledonous herbs, a few shrubs and trees, particularly abundant in the temperate regions of the Northern Hemisphere. The principal genera are *Chorizanthe*, *Eriogonum*, *Rumex*, *Rheum*, *Polygonum*, *Fagopyrum*, and *Coccoloba*. The genus *Polygonum*, which is typical of the order, consists of about 150 species, mostly weeds. Knot-grass (*Polygonum aviculare*) is one of the most extensively distributed

to rest on AB, then $\triangle ABC'$ becomes zero; and as C passes through AB $\triangle ABC$ passes through zero and is considered as having changed its sign and become negative; that is, $\triangle AC'B$ is negative. In the case of polygons in general, the law of signs will readily be understood from the annexed figures. In Figs. 1, 2, 3, both the upper and lower parts of the polygon are considered

FIG. 1.

FIG. 2.

FIG. 3.

FIG. 4.

FIG. 5.

as positive; in Fig. 4, P has reached BC and the upper part of the polygon has become zero; in Fig. 5, P has passed through BC and the upper part of the figure has passed through zero and become negative.

The sum of the interior angles of a polygon

plants of the world; it is an annual of low growth, but very variable, with much branched trailing stems, small lanceolate leaves, and very small flowers, two or three together, in the axils of the leaves. Thunberg says that in Japan a blue dye is prepared from the plant. *Polygonum*

amphibium, one of the species of the section or suborder *Persicaria*, is abundant about margins of ponds and ditches throughout the Northern Hemisphere. It has two forms of leaves; those upon the erect stems being broad and smooth, those which float in the water narrow and rough, differences which might be held to indicate distinct species, yet both may be found growing from one root. The stems have been used on the Continent of Europe as a substitute for sarsaparilla. Several species are occasionally used for dyeing, as the spotted persicaria (*Polygonum Persicaria*), a very common weed on manure heaps and in waste places in Europe and also naturalized in the United States. The only species really important on this account is that called dyers' buckwheat (*Polygonum tinctorium*), a Chinese biennial, with ovate leaves and slender spikes of reddish flowers. It has been successfully cultivated in France and Flanders. It yields a blue dye scarcely inferior to indigo. *Coccoloba*, another genus of this order, has a wide distribution throughout the tropics, *Coccoloba uvifera* and other species producing edible fruits.

POLYGONAL NUMBERS. See NUMBER.

POLYHEDRON (from Gk. Πολύεδρος, *polyedros*, having many bases, from πολῖς, *polys*, much, many + ἔδρα, *hedra*, base). A solid whose bounding surface consists entirely of planes. The polygons which bound it are called its *faces*; the sides of those polygons, its *edges*; and the points where the edges meet, its *vertices*. If a polyhedron is such that no straight line can be drawn to cut its surface more than twice, it is said to be *convex*; otherwise it is said to be *concave*. Unless the contrary is stated the word polyhedron means convex polyhedron. If the faces of a polyhedron are congruent and regular polygons, and the polyhedral angles are all congruent, the polyhedron is said to be *regular*. A polyhedron which has for bases any two polygons in parallel

having 8 faces, 6 vertices, and 12 edges, the equation becomes $12 + 2 = 8 + 6$. For every polyhedron there is another which, with the same number of edges, has as many faces as the first has vertices, and as many vertices as the first has faces. There cannot be more than five regular convex polyhedra. These solids are represented by the accompanying figures, and are sometimes known as the Platonic bodies, from the attention they received among the Platonists.

For these five polyhedra, if *s* be the number of sides in each face, *n* the number of plane angles at each vertex, then, following the other notation above given, $sf = n \cdot v = 2e$. Also the sum of all the plane angles in each figure is $2\pi(v - 2)$. These formulas may easily be verified from the following table of elements:

NAME OF SOLID	s	n	f	v	e
Tetrahedron.....	3	3	4	4	6
Hexahedron.....	4	3	6	8	12
Octahedron.....	3	4	8	6	12
Dodecahedron....	5	3	12	20	30
Icosahedron.....	3	5	20	12	30

The five regular polyhedra can be constructed from cardboard by marking out the following, cutting through the heavy lines and half through the dotted ones, bringing the edges together.

ICOSAHEDRON.

TETRAHEDRON.

HEXAHEDRON.

DODECAHEDRON.

OCTAHEDRON.

POLYHEDRA.

planes, and for lateral faces triangles or trapezoids which have one side in common with one base and the opposite vertex or side in common with the other base, is called a *prismatoid*. (See MENSURATION.) In accordance with the definition, also all prisms and pyramids (q.v.) are included among the prismatoids. Among the general relations of polyhedra, the following are the most remarkable: If a convex polyhedron has *e* edges, *v* vertices, and *f* faces, then $e + 2 = f + v$. (A theorem known to Descartes, but bearing Euler's name.) E.g., in a regular octahedron, a solid

POLYHYMNIA, or **POLYMNIA** (Lat., from Gk. Πολύμνια or Πολύμνια). One of the nine Muses (q.v.). When in late times the functions of the Muses were specialized, she became the Muse of the pantomime, and was represented without special attribute, but closely wrapped in her mantle, and sometimes with her hand upon her mouth.

POLYMASTODON (Neo-Lat., from Gk. πολύς, *polys*, much, many + μαστός, *mastos*, breast, + ὀδούς, *odous*, tooth). A fossil multi-tuberculate animal of the size of a beaver, of which fragmentary remains have been found in the basal Eocene or Puerco beds of New Mexico. The jaws and dentition have some resemblances to those of rodents.

POLYMORPHISM (from Gk. πολύς, *polys*, much, many + μορφή, *morphē*, form). The differentiation either of one animal into two or more incomplete undetached individuals (pseudoindividuals) or zooids, as in the Siphonophores or Physalia; or that of the animal into two separate sexes, or of the latter into castes, as in the termites and ants. Instead of the functions of the whole animal or plant being equally distributed to the individual organs, some of the organs or parts of the animal are set apart for this or that function. In the hydra the individual is monomorphic, not divided into male and female individuals, but in Hydractinia, a fixed, vegetative form, there arise sexual or reproductive zooids, some female and others male, and also hydra-like or nutritive zooids or incomplete individuals. In the Portuguese man-of-war (q.v.) we have a still better example of incomplete polymorphism. Thus, as Hertwig states, division of labor leads to greater centralization, "the more polymorphic an animal colony becomes, the more unified it is, the more it gives the impression of being a single animal instead of an aggregation of single animals."

In the hydroids alternation of generations (q.v.) has arisen from a division of labor or polymorphism of individuals originally of equivalent value, in which some individuals (the sexual ones) have separated and acquired a peculiar structure. Moreover, while alternation of generations has arisen from polymorphism, it can again produce it. Hertwig illustrates this by the case of certain medusæ, which, instead of separating, remain permanently attached to the colony. They then degenerate into 'sporesacs,' in which a mouth, tentacles, and a velum are wanting.

A second kind of polymorphism is that seen in the males and the females of most animals. This is sexual dimorphism, which may pass into sexual polymorphism. This is complete polymorphism. Reproduction by budding involves the differentiation of the animal form into three kinds of individuals—i.e. males, females, and 'neuters,' as among insects. Among the celenterates and worms the forms reproducing by parthenogenesis (q.v.) are usually larval or immature, as if they were prematurely hurried into existence, and their reproductive organs had been elaborated in advance of other systems or organs, for the sudden production, so to speak, of large numbers of individuals like themselves.

Among insects dimorphism is intimately connected with organic reproduction. Thus the summer wingless asexual aphid and the perfect winged autumnal aphid may be called 'dimor-

phic' forms. The perfect female may assume two forms, so much so as to be mistaken for two distinct species.

DIMORPHISM IN BIRDS. Besides ordinary sexual dimorphism, depending on sex, and comprised under the head of secondary sexual characters (see SEX; SEXUAL SELECTION), a few special cases are known, due probably to climate or local causes. Thus, in some species of skua, a particular bird may frequently be found mated with a uni-colored form, either male or female. In the guillemots at nearly every breeding station about one in twenty may be marked with a white circle around the eye, and a white line extending backward from it, these ringed or bridled guillemots being of either sex and apparently paired with birds of normal plumage, no intermediate forms being known. (See DICHROMATISM IN BIRDS.) A striking example of dimorphism in respect to the beak is furnished by the huia (q.v.).

DIMORPHISM AND POLYMORPHISM IN INSECTS. Although sexual dimorphism is very prevalent in insects, there are many instances of dimorphism, resulting from local causes, as temperature. (See TEMPERATURE VARIETIES, especially as relating to seasonal dimorphism, wet and dry forms.) Certain species of grasshoppers are dimorphic. In the honey-ant (*Myrmecocystus Mexicanus*), besides the usual workers, there occur individuals with enormous spherical abdomens filled with honey. Here the cause is evidently connected with the food. See, for other examples, EVOLUTION, paragraph *Polymorphism*.

The chief initial or determining causes of dimorphism and polymorphism, besides sexual selection (q.v.), are changes in temperature, of light, and of other physical agents.

POLYMORPHOUS (in geology). See ISOMORPHISM.

POLYNE'SIA (Neo-Lat., from Gk. πολύς, *polys*, much, many + νῆσος, *nēsos*, island). A name once applied to all the islands in the Pacific Ocean, lying between Asia and America. By modern geographers the name is used to designate a division of Oceania comprising all the islands not included under Micronesia or Melanesia. The most important of them are the Tonga, Samoan, Ellice, Cook, Society, Hawaiian, and Marquesas Islands, and Low Archipelago. The Fiji Islands are included by some in Polynesia and by others in Melanesia, all of which are described in separate articles. For a description of the inhabitants of these islands, consult: Stevenson, *In the South Seas* (New York, 1896); Beeke, *Wild Life in Southern Seas* (London, 1897); Mager, *Le monde polynésien* (Paris, 1902). See POLYNESIANS.

POLYNESIANS. A term used diversely by various writers. By some it is employed as a synonym of Malayo-Polynesian (q.v.) and made to include all the so-called brown race of the regions known as Malaysia, Micronesia, Melanesia, and Polynesia, also known as the Malayan race. F. Müller (1879) made the Poly-Melanesians one of the branches of his Malay race, while Brinton (1890) divides his Malay stock into a Western (Malayan) and an Eastern (Polynesian) group. Deniker makes the Polynesians properly so called one of the great ethnic groups of the Indo-Pacific area. Keane (1896) holds that the Eastern Polynesians are a branch of

the Caucasian division, who possibly in the Neolithic period migrated from the Asiatic mainland. In the best usage the term Polynesian may be considered to denote the section of the brown race inhabiting the innumerable islands of Micronesia, Polynesia proper, and parts of Melanesia, and in a special and particular sense the natives of the islands of the eastern Pacific, Hawaii, Elllice, Samoa, Tonga, Hervey, Society, Low, Marquesas, and minor groups, together with those of New Zealand.

Physically the Polynesians are a prepossessing race, being tall, symmetrically built, and handsome in form and feature—indeed, Dr. McGee tells us that “the Samoan excelled the Greek in bodily vigor and statuesque beauty.” The Maori of New Zealand is a good example of this race. The so-called Micronesians differ but little in physical type from the Polynesians of the eastern Pacific. The color of the Polynesians varies from dark brown to almost white, while their features are often reported as having a European cast, a fact which has been made the most of by the advocates of the Caucasian theory. The hair is dark, smooth, and straight, with here and there a tendency to curliness or crispiness, indicative perhaps of a strain of Papuan blood. Their naïveté, sensitiveness, hospitality, courage in battle (compare the Maoris), sensuality (e.g. Tahitians), skill in boat-building and navigation (Tongans and Samoans, in particular), love of outdoor games, swimming (Maoris, Hawaiians), eloquence in song and story, and other prominent qualities have been emphasized by different writers and travelers. The words *tattoo* and *taboo*, which have come into English from Polynesian languages, commemorate a custom and an institution widespread among them.

The chief industries of the Polynesians at the time of the coming of the Europeans were fishing, agriculture, and the exploitation of vegetable substances and fibres for clothing and ornament, art in wood, shell, etc., and the activities connected with boat-building and navigation. In certain parts of the Polynesian domain cooking was almost a fine art. Cannibalism was not infrequent. The great feasts of the Polynesians were an important factor in their social activities. Among characteristic expressions of Polynesian art and industry may be mentioned cocoa-fibre sennit (for wrapping axe-handles), the bamboo-knife, the ornamental and symbolic axes of the Hervey Islands, etc., the double canoe and the outrigger, the mat sail, *tapa* or bark cloth, feather-work, the stone figures (often of gigantic size), platforms, and edifices of Easter Island, Tonga, the Carolines, etc.—probably more numerous and occurring in more diverse regions of Polynesia than is generally believed—which have unnecessarily been looked upon by some writers as evidences of a great pre-Polynesian civilization, or attributed to Hindu or South American culture-bearers. The bamboo or stick maps of the Marshall Islanders and the stone ground maps of other places deserve to be noted, and so, too, the ‘temples’ and fortifications of a number of tribes, particularly the Maori *pahi*. Rock-sculptures exist in many places, and the celebrated ‘picture-writing’ of Easter Island (q.v.) has received much attention from ethnologists.

The dance and secret societies, profane and religious, have attained great vogue and development in Polynesia, where professional musicians,

singers, poets, and literary association have abounded. The lascivious side of the Polynesian character is represented by the *hula-hula* dance of Hawaii and the *areoi* societies of Tahiti. The ‘fire-walk’ ceremony still survives, especially in Tahiti. The marriage systems of the Polynesians varied at different times and places, from monogamy to polygamy, with all the grades between. A peculiar practice of the Hawaiians gave rise to L. H. Morgan’s recognition of the ‘Punaluan family’ as one of the stages in human social progress. (See POLYANDRY.) Much of the present sexual immorality of the Polynesians is due to contact with the whites.

In the matter of government and social organization, Polynesian peoples present all grades from democracy of an almost pure type to what might well be termed absolute and limited monarchies. Over a considerable portion of Polynesia the division into nobles and common people occurred as in mediæval Europe. In spite of the fearful ravages of vices and diseases introduced by the Europeans, the decreases due to the monopoly by the white man of the best land, etc., and other related causes, which in many cases of the island groups have practically depopulated some and decimated others, an increase of population is reported from certain sections both of English and French Polynesia.

All over the Polynesian area languages show the common origin from one parent stock, practically identical with the parent stock of the Malayan tongues, and proving a Malayo-Polynesian unity. The dialectic variations in Polynesian languages are to a large extent phonetic. The mythology, folk-lore, and primitive poetry of the various Polynesian peoples is rich and imaginative, cosmogonic tales and ancestor-myths, primitive epics and hero-stories being particularly abundant. Love-songs and political orations were extensively cultivated, while the *harepo*, or professional poet, was found in many of the larger groups. In its poetical and literary expression the Polynesian mind shows a combination of naïveté and metaphysics which is very curious.

Facts of language, mythology, art, general culture, and distribution of food-plants point to the peopling of the Polynesian area from the east to the west, with the Samoan group as the chief centre of dispersion. Their distribution over the vast extent of the Pacific was made possible by the seaworthiness and size of their vessels and their skill as navigators. They are comparatively recent intruders into an area that is itself geologically recent. Brinton (1890) places the separation of the Polynesian branch from the Malay at “about the beginning of our era.” According to Horatio Hale, the Marquesas Islands were peopled somewhat less than 2000 years ago, the Hawaiian group in the seventh century A.D., Rarotonga and the Gambier Islands in the thirteenth, and New Zealand in the fifteenth century, while the colonization of some of the other islands was actively going on in the time of Cook—indeed, some of the islands of the Low Archipelago seem not to have been inhabited even in the middle of the eighteenth century. The initial point of departure of the Polynesians from the Malay area is said to have been the island of Buru. The culture of the Polynesians is more or less intimately connected with the food-products of the Pacific islands—the pig, the hen,

several edible roots, the breadfruit, the coconut, etc.

Z.

POLYNESIAN SUBREGION. A subregion of the Australian region in zoögeography, embracing all of the islands of the Pacific Ocean from Guam on the west to the Marquesas on the east. It is characterized mainly by the absence of indigenous mammals, the great scarcity of reptiles, and the comparative uniformity of its birds. The central and most characteristic fauna seems to be in the New Hebrides. The Hawaiian Islands, although included in the subregion, have so many distinctive peculiarities that some naturalists regard them as a separate subregion.

POLYNICES, pŏl'i-ní'séz (Lat., from Gk. Πολυεικής, *Polynēikēs*). A son of Edipus and brother of Eteocles. See ETEOCLES AND POLYNICES.

POLYNOMIAL (from Gk. πολύς, *polys*, much, many + Lat. *nomen*, name, thing). A general name for algebraic expressions of more than one term. See ALGEBRA; FUNCTION.

POLYOLBION. A long descriptive poem by Michael Drayton in thirty parts or songs, published in 1613 and 1622. It is a kind of poetical gazetteer, a description of the rivers, mountains, and forests of England, with histories, traditions, curious facts, and genealogies, generally so accurate that it was used as an authority by later writers.

POLYP (Fr. *polype*, from Lat. *polypus*, from Gk. πολύπους, *polypous*, polyp, polypus in the nose, many-footed, from πολύς, *polys*, much, many + πούς, *pous*, foot). A name once given to any of those minute, attached, usually colonial animals having tentacles around the mouth, now recognized either as a special form of coelenterates (usually some hydroid), or as Polyzoa. The name was given by Réaumur on account of their external resemblance to the many-armed cuttlefishes, which were so denominated by Aristotle; and our knowledge of these organisms, as members of the animal kingdom, hardly dates back much more than a century. Most of them live in colonies, sometimes of great extent, supported on a common stock, to which the term 'polypidom' (polyp-home) is sometimes given, and which may be horny, gelatinous, or calcareous.

The polyps are either imbedded in cavities in the substance of the calcareous polypidom or inclosed in minute cups or tubes in the horny polypidoms, from which the body can be protruded, and into which it can be retracted at pleasure. The solitary species often attain a considerable size (as, for instance, many of the sea-anemones), but the social polyps are always minute, although the combined power of some of the species in modifying the earth's crust is neither slight nor limited in extent, as is shown by the dimensions and geographical importance of coral. See CORAL; CORAL ISLANDS AND CORAL REEFS.

POLYPETALY (from Gk. πολύς, *polys*, many + πέταλον, *petalon*, leaf). A condition in flowers in which the petals are distinct from one another. See FLOWER.

POLYPHEMUS (Lat., from Gk. Πολυφῆμος). In the *Odyssey*, the son of Poseidon, and the nymph Thoösa, the most celebrated of the fabulous Cyclopes (q.v.), who inhabited the coast of Thrinakia. He was of immense size and had only one eye. On his return from Troy Odysseus landed in this region, visited the cave of the Cyclopes in his absence, and awaited his return. The monster penned the Greeks in his cave and ate two at once. Next morning he devoured two more, but that night, after his evening meal, Odysseus presented him with some strong wine, and, when he had fallen into a drunken sleep, bored out his eye with a blazing ship's mast. They then escaped beneath the bellies of the sheep which he had penned within the cave. It was in answer to the prayer of Polyphemus that Poseidon visited Odysseus with so many troubles by sea. The later Alexandrian poetry took up the story of Polyphemus as the giant shepherd, and depicted his love for the coy nymph Galatea, and the same subject was a favorite with artists of the Roman period.

POLYPHEMUS MOTH. One of the large American silk moths (*Telea Polyphemus*), expanding five or six inches. It is yellowish or brownish, with a window-like spot in each wing, divided by a vein, and encircled by yellow and black rings; a dusky band margined with pink lies near the outer margin of both pairs of wings. The caterpillar is light green, with an oblique yellow line on each side of each segment, except the first and last; it feeds on tree foliage. The cocoon is dense, oval, and usually inclosed in a leaf. Sometimes it is suspended from a twig, but ordinarily falls to the ground in the autumn.

POLYPH'ONY (from Gk. πολυφωνία, *polyphōnia*, variety of sounds, from πολύφωνος, *polyphōnos*, having many sounds, from πολύς, *polys*, much, many + φωνή, *phōnē*, sound, voice). In musical composition, the combination in harmonious progressions of two or more parts, each of which has an independent melody of its own. Polyphony is opposed to homophony (q.v.), which consists of a principal part with a leading idea and accessory parts furnishing the harmony. The construction of polyphonic phrases is called counterpoint (q.v.). About the ninth century we find the beginnings of modern polyphony in *organum* (q.v.) or *diaphony*, which was the progression of parts in parallel fifths or fourths. In these first attempts at polyphony there are many dissonances which seem to us intolerable; but in the course of time composers learned the secret of obviating the harsh effects by using

the intervals in proper succession, and the next step was the combining of two voices into a real harmonic structure. Instead of the melody being only in one voice, as in the following example from Guido d'Arezzo (q.v.),

while the second voice intoned an organ-point (q.v.), we have a distinct melody in each voice, as in the following example from the fourteenth century:

When polyphony still further developed and three and four voices were employed, the additional voices were also given separate melodies as far as possible. Still polyphony as we now understand it had not really begun, for, though the voices were combined in an harmonic whole, they did not all assist in the development of a single idea. Composition had musical but not structural unity. With the rise of the great Flemish School (see MUSIC, SCHOOLS OF COMPOSITION) and the appearance of Dufay, Okeghem, Josquin Depres, Willaert, and their contemporaries, polyphony proper came into existence. Practically every form of composition was based on a canon (q.v.) or a fugue (q.v.), and the technical dexterity, the mathematical complexity of these early compositions has never been excelled. The reaction was inevitable. With the death of Palestrina (q.v.) in 1594, the decline began. The triumph of monody (q.v.) was swift and widespread, and though it in its turn was supplanted by more complex harmonic forms (see HARMONY), the era of the polyphonic school has never returned. Consult: *Oxford History of Music*, "The Polyphonic Period," vol. i. (London, 1901); Hope, *Medieval Music* (London, 1899); Humphreys, *The Evolution of Church Music* (London, 1896).

POLYPODIUM (Lat., from Gk. *πολυπόδιον*, sort of fern, from *πολύπους*, *polyπους*, many-footed; so called from the branching rootstock). One of the largest and most widely distributed genera of ferns, containing at least 350 species, in which the sporangia are borne on the back of the frond. The sori are round, distinct, destitute of indusium, and are for the most part arranged in one or two rows on each side of the midrib. In some species the sori are irregularly scattered over the fronds. The species grow on rocks, dry banks, or old logs, and in the tropics many are epiphytic in habit. The venation varies in the different species, and this character was made the basis of systems of classification in which several genera were recognized, *Polypodium vulgare* (polypody), whose fronds grow from two to twelve inches or more in length, is one of the most common and widespread species of America and Europe. There are a number of varieties of this species in Europe, some of

which are extensively grown as ornamentals. The rootstocks of a number of species were formerly employed in medicine, but are now believed to be nearly inert. See Colored Plate of FERNS.

POLYPORUS. A fungus which attacks old trees and timber. See AMADOU; DRY ROT.

POLYPTERUS (Neo-Lat., from Gk. *πολύπτερος*, many-winged, from Gk. *πολύς*, *polys*, much, many + *πτερόν*, *pteron*, feather, wing). A genus of ganoid fishes of African rivers. See BICHIR; REEDFISH.

POLYPUS (Lat., from Gk. *πολύπους*, *polyπους*, polyopus in the nose, poly, many-footed). In surgery, a term employed to signify any sort of pedunculated tumor attached to a surface to which it was supposed to adhere like a many-footed animal, as its name indicates. The most common seat of polypi is the mucous membrane; hence we have polypi of nose, bladder, rectum, and uterus. The only satisfactory mode of treatment consists in their removal, which is effected in various ways, as by the forceps, the éraseur, or the ligature.

POLYTECHNIC INSTITUTE (from Gk. *πολύτεχνος*, *polytechnos*, skilled in many arts, from *πολύς*, *polys*, much, many + *τέχνη*, *technē*, art). A school of science and liberal arts in Brooklyn, N. Y., established in 1854. It granted its first degrees in arts and sciences in 1871 by special authority of the Regents of the State University, and in 1890 was reorganized and received a broad college charter. It now confers the degrees of bachelor of arts and of science, master of arts and of science, and civil, electrical, and mechanical engineer. During the early years of its history the Polytechnic was known as a successful preparatory school, and it still maintains a preparatory department, as a separate institution, which in 1903 had 525 students, while the institute had an attendance of 110, with 50 instructors in all departments. The library contained 12,000 volumes.

POLYTECHNIC SCHOOLS. See TECHNICAL EDUCATION.

POLYTECHNIQUE (*École Polytechnique*). One of the most famous military preparatory institutions of Europe. It was established by the National Convention as the *Ecole Centrale des Travaux Publics* in 1794, and in 1795 its name was changed to *Ecole Polytechnique*. Although originally intended as a preparatory school for all branches of the public service, it was particularly devoted to the training of civil and military engineers. Under the famous mathematicians Lagrange and Monge, the institution developed rapidly, especially in mathematics and physical sciences, a view being had to their application to technical training. In 1804 Napoleon reorganized it on military lines, and under his régime it became a training school for artilleryists and engineers. The *Ecole Polytechnique* is under the supervision of the Minister of War, and is devoted mainly to the preparation of students for the several branches of military and civil engineering. Students must hold the bachelor's degree in order to become eligible for the competitive entrance examination. The course of study covers two years, at the end of which period the names of those who successfully pass the final examination are placed on a list

in the order of merit, and candidates are allowed to choose what branch of the service they wish to take up. Soldiers who have been in the service at least six months may be admitted, without fulfilling all the ordinary entrance requirements. The branches of the service which rely upon the Polytechnique for candidates are: the corps of land and naval artillery, military and naval engineers, the marine, the corps of hydrographic, road, bridge, and mining engineers, and the telegraph and gunpowder superintendencies.

POLYTHEISM (from Gk. *πολύθεος*, *polýtheos*, relating to many gods, from *πολύς*, *polys*, much, many + *θεός*, *theos*, god). The belief in many gods, as opposed to monotheism, or atheism, belief in one god or in no god. The most primitive peoples scarcely recognize any god, but only demoniac forces, and behind polytheism lies the worship of one superior clan-god. But this latter does not exclude a belief in the existence of other gods of other clans, who on occasion may be worshiped, and the bare recognition of more than one god is not irreconcilable with a synchronous worship of only one clan-god or of rites which propitiate only demons. Most of the forms of polytheism known are far from primitive, and represent both internal development and an amalgamation of beliefs. Different clan-gods, in consequence of political fusion or simply through borrowing, may become united into one pantheon. Thus modern Hindu polytheism arises from a union of Aryan and Dravidian deities; Greek polytheism combined Hellenic and Semitic gods; the Teutonic pantheon included different clan-gods with characteristics borrowed from the Finns and others. Polytheism has been derived, in some cases, but not all, from totemism (q.v.).

In this article only the general aspects of polytheism are to be considered. (1) There is only one unbroken series between inchoate and perfected polytheism. Spirits become gods; gods decline into mere spirits. Polydemonism and polytheism constantly interchange. (2) There is scarcely any natural phenomenon that has not been deified, but the order of deification varies in time. In some cases, sky and earth gods are early divinities; in others, they are ignored altogether, or come late into the pantheon. (3) Nature-gods form only a part of the pantheon, which embraces also deified man-gods and ghosts, gods of poetic fancy, of logic, etc. (4) Social development conditions the pantheon, but there is no absolute rule of progression from matriarchal to patriarchal divinities. (5) The concrete comes before the abstract. Tiber and Ganges are divinities before Water is a god. (6) Nature and mind are often correlated in the figures of the pantheon. Water and wisdom, for example, are united in three distinct polytheistic systems, in the Wisdom-spring of Germany, in Ea, the Babylonian god, and in Varuna, the Hindu god of water and wisdom. (7) In some cases local parts of earth are revered before there are any great gods to which worship is paid. (8) This does not exclude the vague recognition of a creator-god to whom worship is not paid. (9) The great phenomenal gods, sun, wind, storm, sky, always expand rapidly when nationalized, taking on attributes not theirs originally. (10) This leads to such gods becoming more and more anthropomorphic and anthropopathic. (11) The ethical element in gods is a reflection of the sociological conditions of the

worshiper. (12) This ethical element in early pantheons is usually accredited only to certain gods, usually the far-seeing and purificatory gods. (13) Besides racial differences in the conception of gods, we must recognize also a perpetual intellectual difference in every race. The same god is thus conceived in different ways by members of the same race. (14) The higher conception is the result of the intelligence of a few minds. It may dominate them, while the older crude conception still obtains among the vulgar. Which conception shall prevail depends on the ascendancy gained by the more intellectual members of the race. (15) There is a tendency in all polytheisms to make social distinctions, to group the gods in classes. Groups of three, nine, ten, twelve gods are common. (16) This grouping tends to make natural triads, as those of sky, air, earth, or sun, lightning, fire, which in turn, as the gods become more human, tend to become converted into family groups, father mother, and son taking the place of an earlier triad.

Early stages of polytheism, where gods and demons interchange in the same personalities, are found in the religion of Babylonia and Assyria, in the Aino and the Polynesian religions, and in the cult of some of the African and American savages. The perfected Babylonian cult shows polytheism in an advanced stage, as do the religions of Greece, Rome, Germany, and India. In India, Egypt, and Greece are found the most marked examples of the tendency to arrange the gods in social groups. Consult: Tiele, *Kompendium der Religionsgeschichte* (3d ed., Breslau, 1903); Saussaye, *Lehrbuch der Religionsgeschichte* (2d ed., Freiburg, 1897); Jastrow, *The Study of Religion*, with full bibliography (ib., 1901); and for special systems of polytheism, see the separate articles, GREEK RELIGION; ROMAN RELIGION; etc.

POLYXENA (Lat., from Gk. *Πολυξένη*). The daughter of Priam and Hecuba. She was betrothed to Achilles, who was killed by Paris while celebrating his wedding with her in the temple of Apollo. At the demand of his shade Polyxena was sacrificed in expiation on his funeral pyre. Her death forms the subject of the first part of Euripides's *Hecuba*.

POLYZO'A (Neo-Lat. nom. pl., from Gk. *πολύς*, *polys*, much, many + *ζῷον*, *zōon*, animal), or MOSS ANIMALS. Minute marine animals usually forming moss-like or coral-like calcareous or chitinous masses called 'corms,' each cell containing a worm-like creature with the digestive tract flexed, the anus situated near the mouth. The body is usually drawn in and out of the cell by the action of retractor and adductor muscles. The mouth is surrounded by a crown of long tentacles. No heart or vascular system exists, and the nervous system consists of a single or double ganglion situated between the mouth and vent, with nerves proceeding from it. The Polyzoa are hermaphroditic, multiplying by budding or eggs. The embryo passes through a morula, gastrula, and trocho-sphere stage, the corm being formed by the budding of numerous cells from a primitive one. The group was formerly called 'Bryozoa.'

Fossil Polyzoa are common in nearly all geological formations from the Ordovician upward. Because of the difficulties attendant upon their

identification, very few of them have served as horizon-markers or index-fossils. The one prominent exception to this rule is the genus *Archimedes*, with its screw-shaped axis, which is so abundant in some parts of the Carboniferous rocks. In North America the Trenton, Cincinnati, and Hamilton groups are especially prolific sources of supply. The European Mesozoic and Tertiary deposits abound in them, one author, D'Orbigny, having described about 850 species

A TYPICAL POLYZOAN.

1. Animal of *Bowerbankia densa* fully expanded: *a*, pharynx; *b*, cardia; *c*, gizzard; *d*, stomach; *e*, pylorus; *f*, intestine; *g*, anus; *h*, muscles. 2. The same animal when completely retracted; *j*, *k*, opercular retractor muscles. 3. An immature animal. 4. A bud in its earliest state.

from the Upper Cretaceous beds alone, while the rocks of these ages in North America are comparatively lacking in them. The North American Paleozoic has afforded about 1325 species, distributed under 170 genera. See Von Zittel and Eastman, *Textbook of Palaeontology*, vol. i. (New York and London, 1900); and Nickles and Bassler, "Synopsis of American Fossil Bryozoa, Including Bibliography and Synonymy," *Bulletin of the United States Geological Survey*, No. 173 (Washington, 1900).

POMACE FLY (ML. *pomacium*, eider, from Lat. *pomum*, apple, pome). One of the small yellowish flies of the genus *Drosophila*, very common about the refuse of cider mills and fermenting vats of grape pomace; also in houses about overripe or decaying fruit, in which they lay their eggs. The larvae also breed occasionally in decaying animal matter and in excrementitious matter, and these flies are hence undoubtedly instrumental in the spread of disease by frequenting the dining-rooms of unscreened houses.

POMARE. The name of four sovereigns of the Society Islands, of whom Pomare IV., Queen of

Tahiti (1813-77), is best known. During her reign France, using the native chiefs as instruments, seized upon the islands in 1842, established a protectorate, and in 1880 annexed them. A revolution in 1852 forced Queen Pomare to abdicate in favor of her children. See TAHITI; SOCIETY ISLANDS.

POMBAL, PÔN'BA'L, SEBASTIÃO JOSÉ DE CARVALHO E MELLO, Marquis of (1699-1782). A Portuguese diplomat and statesman, known to his countrymen as 'The Great Marquis.' He was born May 13, 1699, at the Castle of Soure, near Coimbra. After studying law at Coimbra and serving a short time in the army, Pombal was given an appointment in the service of the Portuguese Government. In 1739 he was appointed Envoy Extraordinary to the Court of London through the influence of his uncle, Paulo Carvalho, and held the position six years, after which he was sent to Vienna in a similar capacity. He there married Countess Daun, and on returning to Lisbon, in 1750, he became popular with the Austrian party in the Portuguese Court and was appointed Minister of Foreign Affairs by King Joseph. His activity was not confined to the external concerns of the realm. His first acts were to limit the power of the Inquisition and also to reattach to the crown a great number of domains that had been unjustly alienated. Then followed the reorganization of the army, the introduction of fresh colonists in the Portuguese settlements, and the establishment of an East India company and a Brazilian company. He introduced into Brazil the cultivation of coffee, sugar, cotton, rice, indigo, and cacao, and freed the Indians from slavery. When the great earthquake of 1755 laid Lisbon waste Pombal displayed surpassing courage and energy in bringing about the rebuilding of a greater and more beautiful capital. The King raised him to the rank of Count D'Oeyras, and in the following year appointed him Prime Minister. He crushed an alleged conspiracy instigated, so he asserted, by the great nobles and the Jesuits, the latter of whom he expelled from Court, and in 1757 confined to their colleges. An attempt upon the life of the King, to which the Jesuits were accused of being a party, but which some historians assert was a plot of Pombal himself to serve his own political ends, placed his enemies completely in his power. The leaders were severely punished by command of the Minister. Pombal made up his mind that the presence of the Jesuits in Portugal was incompatible with the security of the Government and the welfare of the nation, and by a royal decree of September 3, 1759, they were banished from the kingdom as rebels and enemies to the King. Pombal had them seized and carried on board ships, and transported to the States of the Church. The Pope, Clement XIII., vehemently protested, whereupon Pombal caused the Papal Nuncio to be shown across the frontier. He also expelled the Jesuits from the famous missions in Paraguay, which resulted in their complete destruction. All this time Pombal was laboring energetically to improve agriculture in Portugal and the system of primary education. In 1770 he was created Marquis of Pombal, and from this period to the death of the King in 1777 he was at the very height of his power. The accession of Joseph's daughter, Maria I., brought about his downfall.

He was deprived of his office; the numerous alleged conspirators whom he kept in prison were released; many of his measures were abrogated, and Maria ordered him to retire to his castle of Pombal. He died there May 8, 1782. Consult: Moore, *Life of Pombal* (London, 1819); Smith, *Memoirs of Pombal* (ib., 1843); Oppermann, *Pombal und die Jesuiten* (Hanover, 1845); Carey, *Prisons du marquis de Pombal* (Paris, 1865); Carnota, *Marquis Pombal* (London, 1871); Weld, *The Suppression of the Society of Jesus in the Portuguese Dominions* (ib., 1877).

POME (OF. *pome*, *pomme*, Fr. *pomme*, apple, from Lat. *pomum*, fruit). A fruit in which the flesh is developed from the cup-like outgrowth upon which the sepals, petals, and stamens have stood in the flower. Apples, pears, and quinces are illustrations. See FRUIT.

POMEGRANATE (OF. *pome granate*, from ML. *pomum granatum*, apple with seeds, from Lat. *pomum*, apple, *pome*, and *granatus*, having seeds, from *granum*, seed, grain), *Punica Granatum*. A thorny shrub or small tree of the natural order Myrtaceæ, native of Southwest Asia, naturalized in Southern Europe, and widely cultivated during historic time. The cultivated varieties, which are scarcely thorny, have coral red wax-like

POMEGRANATE FRUIT AND FLOWER.

terminal flowers, leathery skinned fruits as large as oranges, yellow with a rosy cheek. Each of the many seeds is enveloped in a sweet or sub-acid separate pulp inclosed by a thin membrane. This pulp is often used for the preparation of cooling drinks. A kind of pomegranate without seeds is cultivated and much prized in India and Persia. There are ornamental varieties with double flowers. The finest morocco leather is said to tanned with the rind of the fruit. In the United States the cultivation of the pomegranate is confined to the southern part of Florida and the warmer parts of California, as the tree is tender, being injured by a temperature of 8° to 10° below freezing. In some portions of the South the plant is used for hedges. It is propa-

gated by cuttings of both green and ripe wood, by layers, and by grafting.

POM'ELO (*Citrus Decumana*). The generally accepted name of the grapefruit (q.v.), or forbidden fruit, a round-fruited, lemon-colored subtropical tree of the natural order Rutaceæ. The sub-acid pulp is highly esteemed as a dessert, for which purpose large and increasing quantities are shipped to Northern and Eastern American markets from California and the West Indies. See Colored Plate of CITRUS FRUITS.

POM'ERA'NIA (Ger. **POMMERN**, póm'mèrn). A province of Prussia, bounded by the Baltic Sea on the north, West Prussia on the east, Brandenburg on the south, and Mecklenburg-Schwerin and Mecklenburg-Strelitz on the west (Map: Prussia, F 2). Its area is 11,628 square miles. The surface is mostly flat, with isolated hills in the eastern part and a general inclination toward the Baltic. The coast is low and is very deeply indented, forming numerous inlets, among which the Stettiner Haff is the most prominent. The only river of importance is the Oder. It forms many ponds along its course, and falls into the Stettiner Haff. There are numerous lakes both along the coasts and in the interior. The climate, especially in the east, is somewhat raw on account of the proximity of the sea. Pomerania is chiefly an agricultural country, although its soil with a few exceptions is rather inferior and in some parts unfit for farming. The best agricultural land is found in the districts of Stralsund and Köslin and along the Oder. Rye, wheat, barley, potatoes, tobacco, and several kinds of beets are raised in vast quantities. Some of these products are exported. Cattle-raising is also a very important occupation. Smoked fish is one of the famous products of Pomerania. The manufacturing industries are of less importance. They are centred chiefly in the cities and are confined for the most part to shipbuilding and the manufacture of machinery. There are also some glassworks, sugar refineries, tobacco factories, woolen mills, breweries, and distilleries. Owing to its numerous harbors, Pomerania has a well-developed sea trade, of which Stettin, the capital, is the centre. The province is divided into the three districts of Stettin, Köslin, and Stralsund, and sends 26 Deputies to the Lower and 25 to the Upper House of the Prussian Landtag. In 1900 the population was 1,634,659, almost all Protestants. The Poles and other Slavs number about 1100.

HISTORY. The Vandals, who occupied the country at the beginning of historic times, were succeeded in the fifth and sixth centuries by the Slavic Wends, who before the end of the twelfth century had been converted to Christianity. Under the Wends the country was divided into several principalities. Two of the princes assumed the ducal title in 1170. In 1181 they were recognized as dukes of the Empire by Frederick Barbarossa, and at the same time the Margrave of Brandenburg received the feudal suzerainty over Pomerania. In 1308 the district between the Persante and the Vistula, known as Pomerellen, was ceded to the Teutonic Order, but territorial gains were made on the west. Subsequently the Elector of Brandenburg received the right of succession to the Pomeranian lands upon the extinction of the ruling house in the male

line. In 1541 the duchies of Stettin and Wolgast were erected, to which were frequently given the names of Hither Pomerania and Farther Pomerania respectively. The line of Slavic dukes died out in 1637, but in the Treaty of Westphalia, in 1648, Brandenburg had to content herself with the greater part of Farther Pomerania. Hither Pomerania and some districts of Farther Pomerania going to Sweden. The Prussian possessions in Pomerania were rounded out by the Treaty of Stockholm in 1720, when Sweden relinquished part of Hither Pomerania, and in 1815 Prussia acquired the rest of Swedish Pomerania.

POMERANIAN DOG. See SHEEP-DOG.

POMEROY, pöm'e-roi. A city and the county-seat of Meigs County, Ohio, 133 miles southeast of Columbus; on the Ohio River and on the Hocking Valley Railroad. It is in a region possessing valuable deposits of salt and bituminous coal, and has no little commercial and industrial importance. It is particularly noted for the production of calcium and bromine. There are also extensive salt works, steel hoop works, foundries and machine shops, furniture and church organ factories, flour and lumber mills, etc. The government is administered by a mayor, elected biennially, and a unicameral council. Pomeroiy was settled in 1816, and was first incorporated in 1840. Population, in 1890, 4726; in 1900, 4639.

POMEROY, JOHN NORTON (1828-85). An American lawyer and author, born in New York. He graduated at Hamilton College in 1847, and was admitted to the State bar in 1851. He then practiced law in Rochester until 1864, and from 1864 to 1868 was professor of law and political science and dean of the law faculty of the University of New York. From 1869 until 1878 he again practiced law in Rochester, and from 1878 until 1885 was professor of municipal law in the University of California. He published editions, with notes, of Sedgwick's *Statutory and Constitutional Law* (1874), and of Archibold's *Criminal Law* (1876), and wrote several works, including: *Introduction to Municipal Law* (1865); *Introduction to the Constitutional Laws of the United States* (1868, 9th ed., 1886); and *Treatises on the Law of Riparian Rights* (1887).

POMEROY, SETH (1706-77). An American soldier, born in Northampton, Mass. He early became a blacksmith and accumulated property, but was chiefly interested in military affairs. He was major of the Fourth Massachusetts Regiment in the successful attack upon Louisburg in 1745, and the next year was engaged against the Indians on the frontier. In the French and Indian War he was lieutenant-colonel in the expedition against Crown Point. When Col. Ephraim Williams was killed at Lake George, September 8, 1755, Pomeroiy took command of the regiment and captured the French commander, Baron Dieskau. Promoted to be colonel in 1757, he marched to the relief of Fort William Henry, and in 1760 he commanded the frontier forts. He was elected to the First Provincial Congress in 1774, was one of the three men put in charge of the military forces of the colony by that body, and was also colonel of the First Hampshire Regiment. In 1775 he was again a mem-

ber of the Provincial Congress, drilled the militia, and is said to have planned the capture of Fort Ticonderoga. In the battle of Bunker Hill Pomeroiy fought at first as a private, but during a part of the day commanded a battalion. On June 22d he was nominated to be one of the first eight brigadiers named by Congress, but, on account of his advanced age, did not accept. In the latter part of 1776, at Washington's personal solicitation, he joined General McDougal at Peekskill, but died of pleurisy, February 17, 1777, before any active service. His journal, published in Trumbull's *History of Northampton* (2 vols., Northampton, 1902), contains much interesting matter concerning the colonial wars.

POMFRET (probably corrupted from Port. *pombo*, *pampo*, *pomfret*). The name in Bermuda of a fish (*Brama Rafi*) allied to the moonfish and harvest-fish, but representing a singular

THE POMFRET (*Brama Rafi*).

family whose three or four species are of almost cosmopolitan distribution. West Indian local names are 'eastagnole' and 'rondanin.' They are large, dun-colored pelagic fishes, which roam widely, descend to great depths, and are good to eat. The young differ decidedly from the adults. Consult Jordan and Evermann, *Fishes of North and Middle America* (Washington, 1898).

POMFRET, JOHN (1667-1702). An English poet, son of Thomas Pomfret, vicar of Luton, in Berkshire. He was educated at Queen's College, Cambridge, and, taking orders in the Church of England, became rector of Maulden, in Bedfordshire (1695), and of Millbrook, in the same county (1702). He published *Poems on Several Occasions* (1699), containing an elegy on the death of Queen Mary, and *The Choice* (1700), which was admired by Dr. Johnson. Besides these he wrote *A Prospect of Death, an Ode* (1700); *Reason, a Poem* (1700); and *Miscellany Poems* (1702). Pomfret's couplets were praised for their correctness. For poems and memoir, consult Johnson's *English Poets*, vol. xxi. (London, 1779).

PO'MO (probably, earth people, indigenes). A group of small tribes constituting a distinct linguistic stock known as the Kulanapan, formerly dwelling in northwestern California. When first described by Gibbs in 1853 they were very numerous, with villages along every stream, but they are now nearly extinct. They were described in 1876 by Powers, in his *Tribes of California*, as a peaceful, good-tempered, and easy-going people, rather below the intellectual standard of their more warlike neighbors. They built conical dwellings of poles and bark for their winter res-

idence, with brush shelters in the summer. Everything eatable, even to an Indian, was included in their commissary. They had a system of dual chieftainship, with rather elaborate marriage ceremonies, and usually burned their dead. A secret society of the Pomo had branches in nearly every village; its members, in horrible disguise, at frequent intervals made the rounds of the dwellings to terrorize the women by their uncouth appearance and antics, the belief being that for the time being the performers were the incarnations of the tribal demons. Like most of the northern California tribes, they had a thanksgiving dance after an abundant acorn crop. Their fame rests chiefly upon the baskets woven by their women. Almost all of their household utensils were of basketwork, and the art survives in almost its old-time perfection among the remnant still living near Ukiah.

POMERIUM, or **POMERIUM** (Lat., space behind the wall, from *post*, after, behind + *murus*, *mærus*, wall). A space about the walls of ancient Rome, marked off by cippi and kept vacant as sacred ground. Its limits were first extended by Sulla, and later by several of the emperors, when the bounds of the Empire were increased.

POMOLOGY (from Lat. *pomum*, apple, pome + Gk. *-λογία*, *-logia*, account, from *λέγειν*, *legein*, to say). The study or cultivation of fruits, particularly those belonging to the apple family. This restricted meaning is not now adhered to, and the term is often used synonymously with fruit culture, and made to include all fruits. See **FRUITS, CULTIVATED**; **HORTICULTURE**.

POMONA (Lat.; connected with *pomum*, apple, pome). An ancient Latin or Italian goddess of the fruit, especially of gardens. Her early prominence is shown by the existence of a *flamen Pomonalis*, at the foot of the list of *flamines* (see **FLAMENS**), and the presence of a sacred grove, the Pomonal, near the road to Ostia. It is, however, still doubtful whether these indications speak for a Pomona or a Pomonus, as a god of that name is found among the Umbrians, or possibly for a pair of divinities, such as is not uncommon in the early Roman religion. In the later Roman poets, especially Ovid, Pomona appears in various legends. Thus she is the wife of the mythical king and prophet, Picus, who was changed by the jealous Circe to a woodpecker. More famous is Ovid's tale of the fair but cold nymph Pomona, who, absorbed in the care of her trees, disdained all other love, till Vertumnus, the 'transformer' who ripens the fruits, after vainly wooing her in many forms, finally approached her as an old woman, who won her favor and told her many stories of the fate of those who had despised love. Even then she remained indifferent to the suit of Vertumnus till the god assumed the form of a youth of perfect beauty, when she yielded and from that time the lovers were inseparable.

POMONA, or **MAINLAND**. The largest of the Orkney Islands (q.v.).

POMONA. A city in Los Angeles County, Cal., 33 miles east of Los Angeles, on the Southern Pacific, the Atchison, Topeka and Santa Fe, and the San Pedro, Los Angeles and Salt Lake railroads (Map: California, D 4). Situated in the San Gabriel Valley, it is a beautiful town,

attractive as a place of residence and as a health resort, and also noted as the centre of extensive fruit-growing interests, especially the culture of oranges. At Claremont, in the vicinity, is Pomona College (Congregational), opened in 1888. Ganesha Park commands a magnificent view of the country, and also of the sea, some fifty miles distant. There is a public library. Pomona was settled in 1875 and incorporated in 1887. Its government is vested in a board of five trustees, who, with most of the administrative officers, are elected by the people. Population, in 1890, 3634; in 1900, 5526.

POMPADOUR, *pôn'pá'dōor'*. JEANNE ANTOINETTE POISSON, Marquise de (1721-64). A mistress of Louis XV. of France. She was born in Paris, December 29, 1721, of obscure parents, bearing the name of Poisson. Lenormant de Tournehem, a rich farmer-general, was supposed to be her father, however, and he saw that she was well educated and well provided for. She excelled in music, elocution, and drawing; but what charmed the brilliant society that frequented the salons of the rich financier was the perfect grace and beauty of her figure, and the exquisite art with which she was dressed. A crowd of suitors sought her in marriage, but in 1741 she became the wife of De Tournehem's nephew, Lenormant d'Étioles. In 1745 Mme. d'Étioles, who had attracted the favorable notice of the King, was installed in the palace of Versailles; soon after she was ennobled by the title of Marquise de Pompadour, and long ruled the King, first as mistress and afterwards as an indispensable purveyor of diversions. The King believed her extremely clever, and after he had lost his first passion for her as his mistress was glad to avail himself of her services as his chief political adviser. In fact, for nearly twenty years her influence was predominant in all important affairs of State. The choice of ministers, of ambassadors, of generals, depended on 'la Pompadour' and her favorite minions. The Austrian Prime Minister, Kaunitz, even induced Maria Theresa to sacrifice her pride to the exigencies of her position, and the Empress-Queen wrote the royal mistress a letter in which she addressed her as *ma cousine*. Largely through the influence of the Marquise of Pompadour was that diplomatic revolution effected which in the Seven Years' War ranged France on the side of her hereditary enemy, Austria. (See **KAUNITZ**.) She made and unmade ministers, and Choiseul-Amboise (q.v.) owed his influence to her support. She was a bitter enemy of the Jesuits and responsible to a great degree for their expulsion from France. She was also noted for her patronage of artists and literary men. She was in receipt of an income of 1,500,000 francs a year, and had apartments at Paris, Versailles, and Fontainebleau. She died at Versailles, April 15, 1764. Consult: Goucourt, *Madame de Pompadour* (Paris, 1887); Pavlovski, *La marquise de Pompadour* (ib., 1888); Dietrick, *Les maîtresses de Louis XV.* (Vienna, 1881); Sainte-Beuve, *Causeries du lundi* (vol. xi.); Fleury, *Louis XV. intime* (Paris, 1899); and De Caraman, *La famille de la marquise de Pompadour* (ib., 1900); also her *Correspondance*, edited by Malassi (Paris, 1878).

POM'PANO (Sp. *pampano*, young vine-tendrill), or **PALOMETA**. A fish of southern waters

representing a section of the great 'horse-mackerel' family Carangide, and of admirable quality. The 'common' pompano (*Trachynotus Carolinus*) dwells along the South Atlantic and Gulf shores of the United States and southward, and is occasionally seen on the Pacific Coast. It has the characteristic ovate form of the group (see Plate of HORSE MACKERELS AND ALLIES), is bluish and silvery in colors, and is about 18 inches long. This pompano is found all the year round at the Florida Keys and south of that, but northward enters the bays in large schools in the spring. These disperse to the feeding and spawning grounds in shallow inlets, and gather again in the autumn for migration. This fish is caught in seines and otherwise both in spring and fall, but is fattest and best in the latter season.

Several other species exist, some of which are valuable. The largest, the 'great pompano' or 'permit' (*Trachynotus Goodci*) of the West Indian region, reaches a length of three feet; it is closely allied to a well-known African one. Another noticeable species is the 'round pompano' (*Trachynotus falcatus*), which may be identical with an East Indian form; it has a more circular outline than the others, and ranges northward to Vineyard Sound. It is not so good as the common pompano; and several other of the numerous species are almost worthless as food, though some, like the 'banner' or 'gaff-topsail' pompano of the Carolina and Gulf coasts (*Trachynotus glaucus*), are exceedingly handsome in form and colors. The so-called pompano (*Rhombus similinus*) so highly prized in southern California, is a somewhat different fish, being one of the true harvest-fishes (q.v.).

POMPEII, pōm-pā'yé. An ancient city of Campania, built at the mouth of the river Sarnus (Sarno), looking out on the Bay of Naples. It stood only a few miles from Mount Vesuvius, between Herculaneum and Stabiae. It was founded as early as the sixth century B.C. by Oscans, who were later conquered by Samnites. The city fell under the power of Rome during the Samnite wars, B. C. 342-290, but retained autonomy in a measure. Under Sulla (B.C. 80), it became a Roman colony, and later a favorite resort for wealthy Romans, many of whom, including Cicero and the Emperor Claudius, had villas in the suburbs. It was also a place of considerable trade, and was the port town of Nola and other inland cities which studded the fertile valley of the Sarnus. Its population must have been about 20,000. The city was much damaged by an earthquake which occurred on February 5, A.D. 63. In 79 occurred that terrific eruption of Vesuvius which, in one day, overwhelmed in irremediable ruin the towns of Pompeii, Herculaneum, and Stabiae. In course of time a small village rose at or near the spot; but the memory of Pompeii faded gradually, and for centuries its very site was unknown. The difficulty of discovering its true position was increased in consequence of the changes produced by this fearful convulsion, which had hurled back the Sarnus from its ancient course, and raised the sea-beach to a considerable height, so that the rediscovered city, to which merchantmen resorted of old, is now a mile from the coast, and a considerable distance from the stream that in ancient times ran near its walls. For more than fifteen hundred years

Pompeii lay undisturbed beneath heaps of ashes and cinders. In 1594-1600 an aqueduct for Torre Annunziata was tunneled under the ruins, but no substantial notice taken of them. It was not till 1748 that any excavations were made. These operations, begun by the Neapolitan Government, have been continued till the present time (and recently with increased energy), and have been exceedingly productive of objects which interest the antiquarian and the classical scholar. The remains found are in a remarkably good state of preservation, owing to the fact that the city was destroyed not by lava, but by showers of ashes and cinders (lapilli), forming a light covering, which found their way into every nook, and, as it were, hermetically sealed up the town. Only about 2000 of the inhabitants perished. Around the bodies of some of these the ashes (mixed with rain) settled into a compactness that preserved the character of the mold after the bodies themselves had turned to dust. Into some of these molds liquid plaster has been poured by the excavators, and thus the form of the bodies preserved. Not only did most of the inhabitants succeed in escaping during the eruption, and in carrying with them their movable valuables, but they returned after the eruption had ceased, tunneled down into and around the houses and public buildings (the upper stories rose above the fallen ashes), and carried off almost everything of value, even to the extent of stripping movable slabs from the buildings. This explains why so few objects of great value have been discovered.

What has been found affords us a remarkably realistic and complete picture of life in a small provincial city of Italy in the first century after Christ. Most of the movable objects discovered, and a large number of the best executed wall-paintings (for example see Colored Plate accompanying article DECORATIVE ART) and floor mosaics, have been removed to the Royal Museum of Naples. Lately, however, one house of a family of wealth (the 'house of the Vettii') has been left, with all its equipments, as found. About one half of the city has already been excavated, and the circuit of the walls (about two miles) determined. Many years must elapse before the entire city can be laid bare. The most interesting discoveries recently have been those of the (unfinished) temple of Venus Pompeiana, and of the remains of a number of fugitives carrying much jewelry and other valuables, whose attempted flight in the direction of Stabiae was blocked by the ruin of the bridge over the Sarnus, or by the lack of boats. They took refuge in a wayside inn, and there perished. The entire countryside around Pompeii abounded in residences of the wealthy, and rich returns doubtless await the excavators there. A beginning has been made near Boscoreale, and the finding of a very valuable table-service of silver at the bottom of a well in a villa is an indication of what may be expected elsewhere. The owner had thrown it there for safety when he fled, and was unable to rescue it later.

BIBLIOGRAPHY. The best book on Pompeii is Mau, *Pompeii: Its Life and Art*, trans. by Kelsey (New York, 2d ed., 1902). Other recent works of merit are: Overbeck-Mau, *Pompeii, in seinen Gebäuden, Alterthümern und Kunstwerken* (Leipzig, 1882); Gusman, *Pompéi*, trans. by Simonds and Jourdain (London, 1900); Weichardt,

POMPEII

"HOUSE OF THE FAUN," WITH MOUNT VESUVIUS IN THE DISTANCE

Pompei vor der Zerstörung: Reconstructionen der Tempel und ihrer Umgebung (Leipzig, 1897). Consult also Duhn and Jacobi, *Der griechische Tempel in Pompeji* (Heidelberg, 1890). For the discoveries near Boscoreale, see Heron de Villefosse, *Le trésor de Boscoreale*, in *Monuments Piot*, vol. v. (Paris, 1899); Barnabei, *La villa Pompeiana di P. Fannio Sinistore scoperta presso Boscoreale* (Rome, 1801). The older works are in general not very trustworthy; among the most important for their illustrations are Mazois, *Les ruines de Pompéi* (Paris, 1824-38); Roux and Barre, *Herculaneum et Pompéi* (8 vols., ib., 1841); Nicolini, *Le case ed i monumenti di Pompei* (Naples, 1854-96); *Real Museo Borbonico* (16 vols., ib., 1824-57). On the paintings, consult: Zahn, *Die schönsten Ornamente und merkwürdigsten Gemälde aus Pompei* (Berlin, 1828-59); Rochette, *Choix de peintures de Pompéi* (Paris, 1844-53); D'Amélio, *Pompei: dipinti murali* (Naples, 1898 et seq.); and especially Helbig, *Untersuchungen über die campanische Wandmalerei* (Leipzig, 1873); id., *Wandgemälde der vom Vesuv verschütteten Städte Campaniens* (ib., 1868); Mau, *Geschichte der decorativen Wandmalerei in Pompei* (Berlin, 1882); Sogliano, "La casa dei Vetii in Pompeii," in *Monumenti antichi*, vol. viii. (Milan, 1898). Important discussions are contained in Nissen, *Pompejanische Studien* (Leipzig, 1877), and Mau, *Pompejanische Beiträge* (Berlin, 1879). A full bibliography is given in Furchheim, *Bibliografia de Pompei, Ercolano e Stabia* (2d ed., Naples, 1891).

POMPEIUS, GNEUS MAGNUS, commonly known as POMPEY, or POMPEY THE GREAT (B.C. 106-48). A famous Roman general and statesman. He was a son of Gneus Pompeius Strabo. At the early age of seventeen he began to learn the military art under his father by service in the field against the Italians in the Social War. Though so young, he gave proof of extraordinary valor and of remarkable energy of character. On the death of his father in B.C. 87, when he was only nineteen years of age, he was left without a protector, and during the temporary triumph of the Marian party he was for some time in considerable danger. When Sulla, to whose side he was attached, returned from Greece to Italy to oppose Marius, Pompey hastened into Picenum, where he had considerable estates and influence, and there raised an army of three legions, with which he successfully opposed the forces of the Marian party, compelling them to quit the district, and effecting a junction with Sulla. During the rest of the war he conducted himself with great prudence and valor, and with such remarkable success, that on the restoration of peace in Italy, the conduct of the war against the remains of the Marian faction in Africa and Sicily was intrusted to him. He speedily performed this commission, and on his return to Rome was honored with the name of Magnus (i.e. 'the Great'), and with a triumph, which, for one who had not yet held any public office, and was merely an *equus*, was an unprecedented distinction. His next exploits were the reduction of the followers of Lepidus, whom he drove out of Italy, and the extinction of the Marian party in Spain, led on by the brave Sertorius. This latter work was one of no small difficulty. Pompey suffered some severe defeats at the hands of

Sertorius, and it was only after Sertorius had been assassinated that he was able to put an end to the war. In returning to Italy, he fell in with and defeated the remnants of the army of Spartacus, and thus claimed the credit of concluding the Servile War.

He was now the idol of the people, and, though legally ineligible to the consulship, was elected to that important office for the year 70, the senate relieving him of his disabilities rather than provoke him to extremities. Hitherto Pompey had belonged to the aristocratic party; but, as he had of late years been looked upon with suspicion by some of the leading men, he publicly espoused the people's cause. He carried a law restoring the tribunician power to the people, and aided largely in introducing the bill of Aurelius Cotta (*lex Aurelia*), that the *judices* should for the future be taken from the *senate*, the *equites*, and the *tribuni aerarii*, instead of from the senate alone. In B.C. 67-66 Pompey performed a noble service for the Republic in clearing the Mediterranean of the Cilician pirates who infested it in immense numbers; and during the next three years, 65-63, he conquered Mithridas, King of Pontus, and Tigranes, King of Armenia, annexed Syria to the Roman dominions, took Jerusalem, and made Judea tributary to Rome. On his return to Italy he disbanded his army, and entered Rome in triumph for the third time in 61. After his return he was anxious that his acts in Asia should be ratified by the senate and certain lands apportioned among his veteran soldiers. But the senate declined to accede to his wish, and he therefore formed a close intimacy and mutual alliance with Caesar. Crassus, who possessed enormous wealth, and who exercised a wide influence at Rome, was induced to forego his grudge to Pompey, and thus these three men formed among themselves that coalition which is commonly called 'the first triumvirate,' and which for a time frustrated all the efforts of the aristocratic party. This small oligarchy carried all before them.

Cæsar's daughter, Julia, was given in marriage to Pompey, and private relationship was thus made to bind tighter the tie of political interest. And now, for some years following, Cæsar was reaping laurels in Gaul, and rising higher in popular esteem as a warrior and statesman, while Pompey was idly wasting his time and his energies at Rome. But Pompey could not bear a rival. Jealousies sprang up; Julia died in 54. Pompey returned to his former friends, the aristocracy, whose great desire was to check Cæsar's views and to strip him of his command. Cæsar was ordered to lay down his office and return to Rome, which he consented to do, provided Pompey, who had an army near Rome, would do the same. The senate insisted on an unconditional resignation, and ordered him to disband his army by a certain day, otherwise he would be declared a public enemy. To this resolution two of the tribunes in vain objected; they therefore left the city and cast themselves on Cæsar for protection. It was on this memorable occasion that he crossed the Rubicon, and thus defied the senate and its armies, which were under Pompey's command. The events of the civil war which followed have been recorded in the life of Cæsar. It remains only to mention that after being finally defeated at Pharsalia in 48 Pompey escaped to Egypt, where, according to the order of the King's min-

isters, he was treacherously murdered by a former centurion of his own, as he was landing from the boat. His head was cut off, and afterwards presented to Cæsar on his arrival in Egypt. But Cæsar was too magnanimous to delight in such a sight, and ordered that the murderer be put to death. Pompey's body lay on the beach for some time, but was at length buried by a freedman, Philippus, who had accompanied his master to the shore.

POMPEY THE YOUNGER (SEXTUS POMPEIUS) (B.C. 75-35). The second son of Pompey the Great, celebrated in Roman history for his resistance to Antonius and Octavianus. Hearing of the death of his father, he fled to Spain, finally escaping to the borders of the Lacetani, and rallying in the mountain fastnesses a gang of banditti. He applied to the Roman senate for the restitution of his father's property, which had been confiscated. He received a large sum of money from the public treasury and the title of commander of the seas. Marching southward, he crushed all opposition, took possession of Bætica, and assumed the state and authority of a sovereign. When he learned, B.C. 43, that a second triumvirate was formed, and that he was among the proscribed, he resorted to piracy, his mariners boarded merchantmen, and Corsica, Sardinia, and Sicily fell into his power. Rome was reduced to the point of starvation by his interception of the corn ships; the people compelled Antonius and Octavianus to negotiate a peace. A treaty was concluded advantageous to Sextus. Sicily, Sardinia, Corsica, and Achaia were given him, and he was promised the consulship the following year. But hostilities were soon resumed, and in 36 a Roman squadron under Agrippa destroyed his fleet off Naulochus. Pompey fled, but after a few months was overtaken by M. Titius, carried to Miletus, and put to death.

POMPEY'S PILLAR. The name of a celebrated column standing on a slight elevation in the southwest portion of ancient Alexandria, a short distance outside the Arabian walls. It is a monolith of red granite, of the Corinthian order, raised upon a pedestal. Its total height is 98 feet 9 inches; shaft, 73 feet; circumference, 29 feet 8 inches. The present name is a mere invention of travelers. The inscription on the base shows that it was erected by Publius, eparch of Egypt, in honor of the Emperor Diocletian, in the year A.D. 302. It stood in the centre of the court of the Serapeum, or great sanctuary of Serapis, and survived its transformations into a church and a fortification.

POMPEY'S THEATRE. A theatre erected in Rome by Pompey, opened in B.C. 55, but not completed till 52. It was the first theatre built of stone, and, in deference to the popular prejudice against such construction for a place of amusement, the stone seats and steps were made to form the approach to a temple of Venus Vietrix, built on top of the cavea. The interior was of marble and seated 40,000 spectators. According to Pliny, it was the scene of extravagant slaughters at its opening and during the time of Augustus. It was destroyed by fire on several occasions, and was restored, continuing in use to the sixth century. Considerable remains exist, particularly under the Palazzo Pio.

POM-POM. An automatic gun (see MACHINE GUNS) extensively used in the Boer-British

War of 1900, first by the Boers and afterwards by the British. Its peculiar noise when being fired rapidly caused the British troops to speak of it as a pom-pom. It is very accurate and effective, and proved to be one of the most formidable weapons of the entire war.

POMPO'NIUS, LUCIUS. A Latin writer of Bologna (Bononia), who lived about B.C. 90. He was among the first to transform the hitherto improvised popular plays called *Atellanae* into a regular branch of comic literature, by the introduction of written composition in the metrical forms and according to the technical rules of the Greeks. About seventy titles and plays by him are mentioned. The extant fragments which are printed in Ribbeck's *Comicorum Romanorum Fragmenta* (1873) show that the author usually chose his subject from low life, and frequently indulged in coarse and even obscene language to gratify the popular taste of the times.

POMPONIUS LÆTUS, JULIUS (or POMPONIO LETO) (1428-98). An Italian humanist and leader in the revival of learning. He was a natural son of one of the Sanseverini, a pupil of Lorenzo Valla, and an earnest student of Latin literature. He is most famed for his effort to pattern after the manners and morals of the ancients, taking Cato for his model and living in the country like the ideal farmer of Varro. His lectures on Latin authors were marked by the scholarly sense of his teacher, and his classes became centres of Roman, not to say Pagan, life and thought, so that he was persecuted by Paul II., imprisoned for a time, but released, although forbidden to renew the meetings of his academy. The principal source for his life is the work of his pupil, Sabellicus, *Vita Pomponii Latii* (Strassburg, 1510).

POMPO'NIUS MEL'A. See MELA.

PON'CA. A tribe of Siouan stock (q.v.), formerly claiming the territory upon the waters of Niobrara River, about the Nebraska-Dakota boundary. They speak a dialect of the same language spoken by the Omaha, Osage, Quapaw, and Kaw, all of whom, according to their own tradition, were originally one people and resided upon the lower Ohio. The Ponca were living about the mouth of the Niobrara when visited by Lewis and Clark in 1804, and remained there, in spite of the inroads of the Sioux, until 1877, when, in consequence of their territory being included in a cession by the Sioux, the main body of the tribe was forcibly removed to what is now Oklahoma. During the march and after arrival they died off at such a rapid rate that the tribe was threatened with extinction, when the matter was brought to public attention, with the result that in 1880 a commission reported in favor of returning them to the north. Accordingly a portion of them returned and are now attached to the Santee agency, northeastern Nebraska. The majority, however, still remain in Oklahoma upon a reservation held jointly with the Pawnee, Oto, and Tonkawa. They were reported to number 800 in 1842, 734 in 1875, and 782 in 1901, of whom 553 were in Oklahoma, and the rest in Nebraska.

PONCE, pón'sà. The capital of the Department of Ponce, Porto Rico, and the second largest city of the island (Map: Porto Rico, B 4). It is situated on a plain bordered by

hills three miles from the south coast, and is well built, with clean macadamized streets, and houses chiefly of stuccoed brick or stone. The principal squares are the Plaza Principal and the Plaza de las Delicias, separated by the Church of Our Lady of Guadalupe, and both containing gardens. Among other buildings are a Protestant church built of iron, several asylums and hospitals, one of which is new and modern, and two theatres, the Teatro de la Perla being the best on the island. The city had, in 1900, forty-two public and seven private schools. The streets and some of the houses are now lighted by electricity, and the city has a good water supply brought by an aqueduct more than three miles long, and piped into the houses. Two main highroads connect Ponce with San Juan and Arecibo on the north coast, and a railroad runs west to Yanco, about 20 miles. An electric street railroad has recently replaced the horse-tramway leading to the harbor of Playa de Ponce, a spacious bay accessible to vessels drawing 25 feet, and provided with wharves. Here are the custom house and the chief commercial houses. This is the principal commercial port of the island, and, in 1900, 589 vessels of 500,652 tons entered. The chief exports are coffee, sugar, molasses, rum, and tobacco. Population, in 1899, 27,952; of the municipal district, 55,477.

PONCE DE LEON, pón'thá dá lá-ón', FRAY LUIS. See LEON, FRAY LUIS DE.

PONCE DE LEON, JUAN (c.1460-1521). A Spanish Governor of Porto Rico and discoverer of Florida. He was born at San Servas, in the Kingdom of Leon. After serving as page to a tutor of the royal family, Juan Ponce in 1493 went to America on the second voyage of Columbus. In 1508 he went to Porto Rico and in 1510 was empowered to conquer the island, of which he became Governor. He rapidly acquired a considerable fortune there, so that when Diego Columbus appointed a successor to him, Ponce was able to fit out three ships with which he started, March 3, 1513, to investigate some stories of a marvelous island named Bimini which the Indians said contained a spring which had wonderful curative properties. There is little in the original narratives to substantiate the legend that this was a 'Fountain of Perpetual Youth' that Ponce was in search of. On March 27th land was sighted. He landed, not far from the mouth of Saint Johns River, and on April 8th, on Easter Sunday (Spanish *Pascua Florida*), took possession of the country. A month later, May 8th, having explored the coast carefully and having had two unsuccessful encounters with the natives, he doubled the point of the peninsula and started up the western coast. Proceeding to the neighborhood of Pensacola Bay, he then returned to the Florida Keys, and crossed to Cuba. From there he sailed to the Bahamas, where he was on July 25th, and after two months more of cruising about the Bahamas reached home September 21, 1513. Ponce immediately took ship for Spain, where he secured permission to conquer and colonize the island, as he supposed it to be, of Florida. Returning in 1515, he was delayed by the necessity of conquering the Caribs from Guadeloupe who were overrunning Porto Rico, and who inflicted several severe defeats upon the Spaniards. It was not until 1521 that he was again ready

to start for Florida. With two ships, carrying two hundred men, he proceeded to a harbor, probably Charlotte Harbor or thereabouts, where he landed and prepared to build a settlement. The natives, however, attacked the white men so fiercely that they were soon compelled to reëmbark. A storm separated the vessels, one of which made its way to Vera Cruz, where it arrived just in season to assist Cortés at a critical period in his conquest. Ponce, who had been dangerously wounded in the knee by the Indians, started back to Porto Rico in the other vessel, but he died before arriving there. Consult HARRISSE, *Discovery of North America* (London, 1892).

PONCELET, pón's'lá', JEAN VICTOR (1788-1867). A French engineer and mathematician, born in Metz. From 1807 to 1810 he attended the Ecole Polytechnique, where he studied under Monge. In 1812 he entered the army as lieutenant of engineers, and was made prisoner on the retreat of the French from Moscow. He was taken to Saratov, on the Volga, where, away from all scientific assistance, he laid the foundations of projective geometry. On his return to Metz (1814) he continued his investigations. He found, however, no recognition in the Paris Academy, and therefore published his contributions in *Crelle's Journal*. In 1829 he collected these essays in the *Traité des propriétés projectives des figures* (1822; 2d ed., 2 vols., 1865-66). He then turned his attention to applied mechanics and published several works on the subject. In 1835 he became professor of applied mechanics at Paris, and in 1848 he was raised to the rank of general. In 1851 he went to London as president of a commission to the International Exhibition, and later published a report upon his mission, *Machines et outils appropriés aux arts textiles* (3 vols., 1854-62), in the *Collection des travaux de la commission française*, which is of great importance in the history of technical science. He published in more complete form the work which he began at Saratov in the *Applications d'analyse et de géométrie* (1862-64). Poncelet is the real founder of modern geometry, and had a very strong influence on German geometry, although he found little recognition in France. Some of his other works are: *Sur les roues hydrauliques verticales* (1826); *Théorie des effets mécaniques de la turbine Fourneyron* (1838); *Expériences hydrauliques*, jointly with Lebros (1832); *Introduction à la mécanique industrielle, physique ou expérimentale* (1829; 3d ed. 1870; German trans. 1841-45); *Cours de mécanique appliquée aux machines* (1845; 3d ed. 1874-76; German trans. 1845-49). Consult: Didion, *Notice sur la vie et les ouvrages du général Poncelet* (Paris, 1869); Bertrand, "Eloge historique de Poncelet," in the *Mémoires de l'Académie des Sciences* (ib., 1879).

PONCHIELLI, pón'ké-él'le', AMILCARE (1834-86). An Italian composer, born at Paderno Fasolaro, near Cremona. He was one of the most important Italian composers of the nineteenth century, and although little known to the world at large, was regarded by his countrymen as second only to Verdi. He was educated at the Conservatory of Milan, and made his début as a composer with *I promessi sposi* (1856). Other operas were *La sarajarda* (1861); *Roderica*

(1864); *La stella del monte* (1867); *Le due gemelle* (1873); *I Lituani* (1874); *La Gioconda* (1876); *Il figliuol prodigo* (1880); *Marion Delorme* (1885). He wrote the famous *Garibaldi Hymn* of 1882, perhaps his most enduring composition. Popular as he was in Italy, *Gioconda* was the only work of his that found favor abroad. He wrote many ballets and orchestral suites, and during the time he was *maestro* of the Piacenza Cathedral (1881-86) wrote considerable sacred music.

POND, FREDERICK EUGENE (1856—). An American author and editor, born in Packwaukee, Wis. He frequently wrote under the pseudonym Will Wildwood. From the beginning of his journalistic career he devoted his attention to sporting matters, the protection of game, and the like. For five years he was field editor of the *New York Turf, Field and Farm* (1881-86), and continued to be corresponding editor of the same after it had absorbed his year-old *Wildwood's Magazine* (1888-89). Besides editing several sporting works and contributing to encyclopedias, he wrote a *Handbook for Young Sportsmen* (1876); *Memoirs of Eminent Sportsmen* (1878); and *The Gun Trial and Field Trial Records of America* (1883).

POND, JAMES BURTON (1838-1903). An American lecture manager, born in Cuba, Allegany County, N. Y., and brought up in Lake County, Ill., and Fond du Lac County, Wis. He was a journeyman printer in 1856, and for a time lived with John Brown in Kansas, and was typesetter to the *Herald of Freedom*. In 1859 he joined the first settlers of Denver, Col. Then for two years he edited the *Markesan Journal*, a Wisconsin weekly, and in 1861 volunteered in the Third Wisconsin Cavalry, with which he did border duty in Kansas and Missouri. Captain Pond was one of the seventeen survivors out of one hundred and eighteen treacherously surprised and shot by Quantrell at Baxter Springs in 1863, and at the close of the war received the rank of major. From 1865 to 1873 he was in business in the West, and then settled in Boston, where he bought the Redpath Lyceum Bureau. In 1879 he removed to New York City, where he established the American Lecture Bureau. Major Pond managed the tours of many great lecturers, especially Henry Ward Beecher, as well as Emerson, Sumner, Phillips, Gough, Talmage, Nast, Mrs. Livermore, George Kennan, Mark Twain, and, among Englishmen, Canon Kingsley, H. M. Stanley, Matthew Arnold, Ian Maclaren, Anthony Hope, and Conan Doyle. He wrote *A Summer in England with Henry Ward Beecher* (1886) and *Eccentricities of Genius* (1900).

POND, JOHN (1767-1836). An English astronomer, born in London. At sixteen he entered Trinity College, Cambridge, but was compelled to leave on account of ill health, and spent several years abroad. At his return he settled at Westbury, near Bristol, and erected there an altazimuth instrument 2½ feet in diameter. His observations by this, submitted to the Royal Society in a paper "On the Declinations of Some of the Principal Fixed Stars" (1806), showed that the Greenwich quadrant had changed its form and that a reëquipment of the Royal Observatory was necessary. In 1811 he was appointed Astronomer Royal. In this capacity

he effected a reform of the national observatory and procured for it modern instruments. By the six-foot mural circle mounted in 1812, he catalogued the north polar distances of 84 stars. He introduced the use of the mercury horizon as a substitute for the plumb-line and spirit level, and the method of observing the same object alternately by direct and reflected vision. Pond was also the inventor of the method of observing in groups and the multiplication method. He also showed the unreality of the parallaxes of certain stars observed by Brinkley. He was awarded the Lalande prize in 1817 and the Copley medal in 1823. He was a member of the Board of Longitude, and superintended the issuing of the *Nautical Almanac*, 1832-33. In 1833 he completed a standard catalogue of 1113 stars. His scientific contributions appeared in the *Transactions* of the Royal Astronomical Society and the Royal Society. He also translated Laplace, *Système du monde* (1809).

PONDICHERRY, pōn'di-shēr'rē, or **PONDICHERRI** (Fr. **PONDICHERY**, pōn'dē'shā'rē). The capital of the French possessions in India. It has a territory of 115 square miles, which is surrounded by the British district of South Arcot, in the Province of Madras. The city is situated on the Coromandel Coast, in 11° 56' north latitude and 79° 50' east longitude, 88 miles south of Madras, with which it has railway communication (Map: India, D 6). The territory of Pondicherry is divided into four districts, and comprises a large number of villages. The population of the town of Pondicherry in 1901 was 47,972; the population of the territory is about 180,000. The town stands on a sandy plain, and is divided by a canal into a European and a native town. Around a handsome square are grouped the Governor-General's residence, the Catholic Cathedral, the Hôtel de Ville, and the Bazaar. The Governor of Pondicherry is Governor-General of the French possessions in India. The town has a European college and an Indian school. The open roadstead is defended by a citadel, and possesses a lighthouse. There is an iron pier over 450 feet long, and near its entrance are interesting monuments, including a statue of Duplex (q.v.). An active import and export trade is carried on, the principal exports being cotton manufactures, rice, nuts, and hides. The spinning and weaving of cotton is the chief industry.

HISTORY. The first settlement of the French in India was at Surat in 1668. The chief of the French East India Company at that time was Carou. Subsequently he took Trincomali from the Dutch, but they were not long in repossessing themselves of it; Carou then turned to the Coromandel Coast. In 1672 he took from the Dutch São Thomé, a Portuguese town (now a suburb of Madras); but two years later the Dutch retook this place also. It was then that François Martin collected about sixty Frenchmen and settled them in Pondicherry, which, in 1674, he had purchased, with the surrounding territory, from a lieutenant of Sivaji, the great Mahratta conqueror. The Dutch took the town in 1693; but by the Treaty of Ryswick it was restored to the French in 1697. Chandernagar, on the Hugli, was ceded to the French in 1688 by Aurungzebe. In 1727 they obtained the cession of Mahé, on the Malabar coast; in 1739

they purchased Karikal from the King of Tanjore; and in 1752 Yanaon was ceded to them. Dupleix (q.v.) was Governor of Pondicherry when war broke out between France and England in India. In 1746 La Bourdonnais took Madras. In 1748 Admiral Boscawen besieged Pondicherry, but two months later was compelled to raise the siege. In the same year occurred the Peace of Aix-la-Chapelle; but it did not put an end to hostilities in India till some time later. In 1757 war recommenced. In 1758 Lally became Governor-General of the French possessions in India and attacked the English settlement of Fort Saint David, which surrendered, and was totally destroyed. In 1761 Eyre Coote took Pondicherry. By the Peace of Paris (1763), Pondicherry was restored to the French with reduced territory, as well as Mahé, Karikal, and Chandernagar. Pondicherry was again taken by the English under Sir Hector Monro in 1783, and restored in 1783. In 1793 the English repossessed themselves of it, but the Treaty of Amiens in 1802 again restored it, though only till the following year. From this time it was held by the English till, by the treaties of 1814 and 1815, it was for the last time restored to France. Consult Quennefer, *Souvenirs de Pondichéry* (Lyons, 1882).

PONDICHERRY VULTURE. A small black-eared vulture (*Otogyys calvus*) of India, Burma, and Siam, which is especially characterized by the nakedness of the inside of the thighs. It is nowhere numerous, and is called by the Hindoos 'king vulture,' on account of its domineering manners. It nests in trees, adding year after year to the old structure until an enormous mass results. See Plate of VULTURES.

POND LILY. See WATER LILY.

POND'DOLAND. A mountainous and fertile district of Cape Colony, situated on the south-eastern coast, and covering an area of over 4000 square miles (Map: Cape Colony, N 7). It was acquired by Great Britain in 1884, being the last remaining portion of independent Kaffraria, and was annexed to Cape Colony in 1894. Population, about 200,000.

POND-SNAIL. A snail of the pulmonate family *Limnæidae*, which inhabit the fresh waters of temperate regions. All are vegetable-eaters and seek their food beneath the water. They lay their eggs in clusters surrounded by a clear gelatin-like substance, and attached to plants and other objects beneath the water. The typical pond-snails are those of the genus *Limnæa*, which have thin, horny shells forming a slender spiral with a large aperture, not protected by an operculum. When the ponds are frozen or dry up, they bury themselves in the mud, and become dormant until released. The largest species (*Limnæa stagnalis*) is scattered abundantly over most of the Northern Hemisphere, and may become two inches in length. Many other species are known in North America, most of them less than an inch long. A smaller, less drawn-out shell, differing from *Limnæa* primarily in the fact that it is sinistral, while the shells of *Limnæa* follow the ordinary method of turning from left to right, is that of the genus *Physa*. It is more southerly in its distribution than *Limnæa*, but several species are found throughout the United States, one of which (*Physa heterostropha*) is exceeding-

ly abundant. (See *Physa*.) Another prominent genus, with a large number of familiar species, is *Planorbis*, so called because its shell is coiled in a flat spiral like a roll of tape; none exceed three-fourths of an inch in diameter. Among other genera may be mentioned *Ancylus* and

A POND-SNAIL (*Limnæa*).

Gundlachia, which are shaped nearly like limpets, and have similar habits, although they inhabit fresh water alone, and are not larger than grains of rice. All the pond-snails are infested with parasites, and certain of them regularly form the hosts of the liver-flukes of the genus *Distoma* during one stage of their development. Pond-snails are not only interesting objects in an aquarium, but of much utility in keeping the glass free from coniferoid growths, which they constantly feed upon. Consult: Cooke, "Shells," vol. iii. of *Cambridge Natural History* (London, 1898); Binney, *Land and Fresh-Water Shells of North America*, Part ii. (Smithsonian Institution, Washington, 1865). See PULMONATA; SNAIL.

PONEVYEZH, póná-vyézh'. A town in the Government of Kovno, Russia, situated 76 miles north-northeast of Kovno (Map: Russia, B 3). It has a realshule, and extensive manufactures of yeast, flour, tobacco, and spirits. Its trade in flax and flaxseed is also important. Population, 13,044, mostly Jews.

PONIATOWSKI, pónyâ-tów'skâ. The name of a Polish family of Italian origin, descended from the family of the Torelli. A member of this family settled in Poland, and assumed the name of Poniatowski from his wife's estate of Poniatow. The most notable members of the family were: PRINCE STANISLAS PONIATOWSKI (1677-1762), who joined Charles XII. of Sweden in supporting Stanislas Leszczynski. He fought at Poltava (1709), and as the representative of Charles XII. at Constantinople induced the Porte to declare war against Russia. He subsequently held high places at the Court of Augustus III. of Poland. His son Stanislas ascended the throne of Poland. (See STANISLAS II.) Another son, Andreas, became the father of the most distinguished member of the family, JOSEPH ANTONY, PRINCE PONIATOWSKI, the celebrated Polish commander in the army of Napoleon. The latter was born at Warsaw, May 7, 1762, and at the age of sixteen entered the Austrian army, serving in-chief of the Army of the South. In 1792 he returned to Poland, and was named commander-

in-chief of the army of the south. In 1792 he defeated superior Russian forces, but Poniatowski's uncle, King Stanislas, by joining the confederation of Targowitza, put an end to the contest in 1793. The Prince then resigned his command and went into voluntary exile, but returned in the following year to aid Kosciuszko, now dictator, in his fruitless opposition to the third partition of Poland. On the proposal of Napoleon to reconstitute the Kingdom of Poland, Poniatowski joined the French (1800) at the head of a Polish force and did good service against the Russians. After the erection of the Duchy of Warsaw (1807) Poniatowski was appointed Minister of War, and in 1809, when the war between France and Austria was resumed, he drove the Austrians out of Polish territory and overran a considerable part of Galicia. In 1812 he joined the French army destined to invade Russia, with a Polish force of 100,000 men. The greater part of his army was broken up into detachments, which were incorporated with the various French legions, and Poniatowski was left with not more than 30,000 men under his direct command. At the head of this division he distinguished himself in the campaign, but was so severely injured at Smolensk during the retreat that he was obliged to return to Warsaw in December, 1812. He rejoined the French army in the autumn of 1813 and fought with such remarkable valor during the first day of the battle of Leipzig (see LEIPZIG, BATTLES OF) as to gain the title of Marshal of France. When the French abandoned Leipzig, on October 19th, Poniatowski was left with the remnant of his Polish division to protect the retreat. The only bridge across the Elster being wrecked through a mistaken order, he attempted to swim his horse across the river, and had reached the farther bank when he fell back exhausted into the flood. His body was recovered six days after, and was embalmed and carried to Warsaw, whence it was afterward removed to Cracow, and placed beside the ashes of Sobieski and Kosciuszko.—PRINCE JOSEPH PONIATOWSKI, a second cousin of the preceding, musical composer, author of *Don Desiderio* and other operas, and several masses, was born in Rome, February 21, 1816, and died in London, July 4, 1873.

PONSARD, pôn'sär', FRANÇOIS (1814-67). A French dramatist, leader of the 'School of Good Sense' in a reaction from the dramatic vagaries of Romanticism. He was born June 1, 1814, at Vienne. He studied law, but soon gave it up for letters, at first as a follower of Hugo, in which capacity he translated Byron's *Manfred* (1837). His reaction from Romanticism was heralded by *Lucrèce* (1843), which, aided by the genius of Rachel, achieved in 1853 great popularity. He followed this by *Agnès de Méranie* (1846), *Charlotte Corday* (1850), *Horace et Lydie* (1851), *Ulysse* (1852), *L'honneur et l'argent*, his best comedy (1853), *La bourse* (1856), *Le lion amoureux* (1866), and *Galilée* (1867), but from 1853 onward his reformed Classicism was superseded by the modern social drama inaugurated by Dumas the Younger and his own former pupil, Augier. The Academy elected him a member in 1855. He died in Paris, July 13, 1867. *L'honneur et l'argent* still holds the stage. His characterization in general is shallow and his situations are sentimental and

romanesque, but his verse is sonorous and his style clear. Ponsard's works were collected in 3 vols. (1876).

PONS A'SINO'RUM (Lat., asses' bridge). The name popularly given to the fifth proposition of the first book of Euclid, from its supposed difficulty to beginners.

PONT (KYLPOINT, or KYNPOINT), ROBERT (1524-1606). A Scottish reformer, born at (or near) Cubross, Perthshire. He studied at Saint Leonard's College in Saint Andrews University, was one of the committee appointed to revise the *Book of Discipline* (1561), and, in 1562, became minister at Dunkeld. He became provost of Trinity College (near Edinburgh) in 1571, and in 1572, by exception, a lord of session. In 1584 he protested against the acts of Parliament respecting the Kirk's jurisdiction, was thereupon deprived of his seat as lord of session, and fled to England. He was prominently active in the coöperation of the Kirk with the Crown in the suppression of Roman Catholicism, and was a member of various commissions appointed to confer with James VI. His published writings include: *Parvulus Catechismus* (1573); *A New Treatise on the Right Reckoning of Years and Ages* (1599); *De Unione Britanniae* (1604); and a translation (1566) of the Helvetic Confession. His rendering of Pindar's *Olympic Odes* was not printed.

PONT, TIMOTHY (c.1560-c.1630). A Scottish topographer, educated at Saint Andrews (1579-84). He was minister of Dunnet, Caithness, from 1601 until 1609, when he took up forfeited lands in Ulster. The result of his extensive travels through every district of his native land and the isles adjacent was the earliest Scottish atlas, which he did not live to complete. His clear and faithful maps were first published in vol. v. of Bleau's *Atlas* (1668), and the originals are to be seen in the Advocates' Library, Edinburgh. In 1850 appeared *The Topographical Account of the District of Cunningham, Ayrshire, compiled about the Year 1600 by Mr. Timothy Pont*.

PONTA DELGADA, pôn'tá dël-gá'dá. The principal city of the Azores, situated on the south coast of the island of Saint Michael's (*São Miguel*) (Map: Spain, B 5). It has a roadstead protected by a breakwater 2800 feet long, and an extensive commerce and shipping. The chief exports are oranges, lemons, and other fruits, most of which are shipped to England. Population, in 1890, 16,767; in 1900, 17,675.

PONT-A-MOUSSON, pôn'tá moo'sôn'. A town in the Department of Meurthe-et-Moselle, France, 17 miles northwest of Nancy by rail (Map: France, N 3). The Moselle flows through the town, which is situated in a fruitful valley. The principal buildings are the fine Gothic Church of Saint Martin, the sixteenth-century Late Gothic Church of Saint Laurent, the hôtel de ville, and a handsomely ornamented Renaissance house, the last two on the triangular and arched Place Duroc. The town is dominated on the east by a hill 1010 feet high, crowned by a ruined castle and the village of Mousson. There are manufactures of pottery, woollens, plush, velvet, and beet sugar, and extensive iron foundries. Population, in 1901, 12,847.

PONTARLIER, pōn'tár'lyá'. The capital of an arrondissement in the Department of Doubs, France, situated near the Swiss boundary, 26 miles southeast of Besançon (Map: France, N 5). It is fortified and occupies a very important strategic position at the entrance to the Défilé de la Cluse, one of the principal passes over the Jura. In 1871 the town was captured by the Prussians, and the French Army of the East was forced to retreat into Swiss territory. Population, in 1901, 7963.

PONTASSIEVE, pōn'tás-syá'vá. A town in the Province of Florence, Italy, situated at the junction of the Sieve with the Arno, nine miles by rail east of Florence (Map: Italy, F 4). It is a walled town with well-kept streets, a fine square, and an old castle. The inhabitants are engaged chiefly in agricultural pursuits. Annual fairs are held, and there are manufactures of railway supplies, agricultural implements, and glass. Population (commune), in 1881, 11,368; in 1901, 13,405.

PONTCHARTRAIN, pōn'chár-trán', LAKE. A large salt-water lake in the southeastern part of Louisiana (Map: Louisiana, E 3). It is 40 miles long and 25 miles wide, and communicates eastward with Lake Borgne and Mississippi Sound by the Rigolets Pass, through which the tide-water flows, while on the west it is connected by a bayou with the smaller Lake Maurepas. On its southern shore, which comes within five miles of the Mississippi River, are the northern suburbs of New Orleans, and two canals navigable for small vessels reach to the heart of the city, where they terminate in basins. The southern shores are low and in parts marshy, with cypress swamps on the west. The north shore is elevated and healthful, being adjacent to the pine barrens, and affords good sites for summer residences and resorts. The lake is on the whole shallow, the maximum depth being 20 feet, but it is used to a considerable extent in the coasting trade with New Orleans.

PONTE, pōn'tá, JACOPO DA. See BASSANO II.

PONTECORVO, pōn'tá-kór'vó. A city in the Province of Caserta, Italy, situated on the Garigliano, 53 miles northwest of Naples (Map: Italy, II 6). It has a cathedral with mediæval manuscripts, fine churches, a gymnasium, and an old castle. There are manufactures of rope, hats, and macaroni. Pontecorvo formerly belonged to the Papal States. In 1810 Napoleon I. gave the title of Prince of Pontecorvo to Marshal Bernadotte. Population (commune), in 1881, 10,191; in 1901, 12,237.

PONTEDERA, pōn'tá-dá'rá. A town in the Province of Pisa, Italy, situated at the junction of the Era with the Arno, 13 miles southeast of Pisa, with which it is connected by steam tramway (Map: Italy, E 4). The town has bridges over both rivers, a thirteenth-century church, and a gymnasium. The weaving of woolen and cotton cloth and the manufacture of oil and chicory are the chief industries. Population (commune), in 1881, 11,701; in 1901, 13,044.

PONTEFRACT, pōm'frēt. A market town and municipal borough in Yorkshire, England, 21 miles south-southwest of York (Map: England, E 3). There are a grammar, a national, and other schools, several almshouses, a large

workhouse, and a splendid market hall. The town owns its water, cemetery, markets, and recreation grounds. Its trade is chiefly in agricultural and garden produce, cattle, and malt; licorice is largely cultivated for the 'Pontefract lozenges,' known since 1562. The Castle of Pontefract was built shortly after the Conquest. It was the scene of the imprisonment and death of Richard II., and here also Rivers, Grey, and Vaughan were put to death, at the instigation of Richard III. It was besieged four times during the Civil War, and was dismantled in 1649. There are but meagre remains of the structure. Population, in 1891, 9700; in 1901, 13,400.

PONTEVEDRA, pōn'tá-vá'drá. The capital of the province of the same name in Galicia, Spain. It is situated in a beautiful and fertile valley at the head of a bay on the northwestern coast of the Peninsula (Map: Spain, A 1). A stream flowing through the town is crossed by a Roman bridge (*pontus vetus*) of 12 arches. The town is well built, with spacious streets and beautiful alamedas or promenades lined with trees. There are a number of convents and monasteries, a Gothic church, and many modern buildings, the finest of which is the provincial Government palace built in 1889. Sardine fisheries and manufacturing are leading industries. Population, in 1887, 19,996; in 1900, 22,806.

PONTEVEDRA. A town of Negros, Philippines, in the Province of Western Negros, situated on the western coast of the island, 22 miles south of Bacólod. Population, 12,000.

PONTIAC (c.1720-69). A famous chief of the Ottawa Indians and leader of the confederate tribes of the Ohio Valley and Lake region against the English in 1763-65. He was born in what is now northwestern Ohio, his mother being an Ojibwa. He distinguished himself in the French service at an early age, and is said to have led the warriors of his own tribe against Braddock in 1755. When Major Rogers was sent out in 1760 to take possession of the Western posts on behalf of the English Government, he was halted by Pontiac near the present Cleveland with the significant warning, "I stand in the path," but finally with Pontiac's consent proceeded on his way to Detroit. Pontiac professed loyalty to the English King, apparently in good faith, but in a short time organized a confederacy which embraced practically all the tribes from the head of Lake Superior almost to the Gulf coast. His declared object was to drive out the English and recover the country for the Indians, who were still to hold themselves friendly to the French. According to the arrangement, the warriors of each tribe, on a concerted day, early in May, 1763, were to attack the garrison in their immediate neighborhood. Pontiac himself was to lead the assault at Detroit. Throughout the great wilderness extending from the Pennsylvania frontier to Lake Superior there were then fourteen English (formerly French) posts, of which the most important were those at Fort Pitt, Detroit, and Mackinaw. The attacks were made as planned, and the Indians captured all but four of the fourteen posts, Niagara, Pitt, Ligonier, and Detroit. Mackinaw was taken by a stratagem and the entire garrison was massacred. A plot for the capture of Detroit seems to have been betrayed to the commanding officer, Major Gladwin, by an Indian girl, and

completely failed, whereupon Pontiac at once laid siege to the post. The siege continued five months, varied by desultory attacks and sorties and attempts to relieve the fort with men and supplies. The most notable event of the siege was the action at Bloody Bridge, July 31, 1763, in which a sortie of troops was repulsed by Pontiac. Forts Pitt and Ligonier, to which the Indians had laid siege, were relieved by Colonel Bouquet, who defeated the Indians at Bushy Run, near the former post. Reinforcements finally succeeded in entering Detroit; Pontiac's men began to desert him, and the news of the signing of a treaty of peace between France and England removed all hopes of French aid. Pontiac, thoroughly discouraged, thereupon raised the siege of Detroit. In 1764 Bouquet led a second expedition into Ohio, which compelled the tribes to submission, and on August 17, 1765, Pontiac himself entered into a formal treaty of peace at Detroit, which he confirmed at Oswego with Sir William Johnson the following year. He was murdered at Cahokia, Ill., in 1769, by an Illinois Indian, who seems to have been bribed by an English trader. In revenge the northern tribes made concerted war upon the Illinois tribes, and within a few years virtually exterminated them.

The genius of Pontiac is shown by his capacity to mold the warriors of so many diverse tribes and languages into a working unit capable of striking a simultaneous and effective blow across five hundred miles of wilderness, and afterwards by his maintaining a close siege of a fortified garrison for five months. Consult Parkman, *Conspiracy of Pontiac* (Boston, 1851).

PONTIAC. A city and the county-seat of Livingston County, Ill., 92 miles southwest of Chicago; on the Vermilion River, and at the junction of the Wabash, the Chicago and Alton, and the Illinois Central railroads (Map: Illinois, D 3). It is the seat of the State Reformatory for juvenile offenders, with some 1400 inmates, and has fine public library and city hall buildings and a park (Riverside). The commercial interests of the city are important, the surrounding region being a productive farming and stock-raising country, and possessing extensive deposits of bituminous coal. The principal industrial plants include shoe factories with a large output and manufactories of candy, boxes, and hooks and eyes. The government is vested in a mayor, elected every two years, and a unicameral council. Founded in 1829 by settlers from Ohio and Indiana, Pontiac was first incorporated in 1856, and in 1872 received a city charter. Population, in 1890, 2784; in 1900, 4266.

PONTIAC. A city and the county-seat of Oakland County, Mich., 26 miles northwest of Detroit, on the Clinton River and on the Grand Trunk, the Detroit, Grand Haven and Milwaukee, and other railroads (Map: Michigan, K 6). It is situated in a picturesque lake region, noted for its hunting and fishing. It is the seat of the Eastern Michigan Asylum for the Insane, with grounds occupying over 500 acres, and has a public high school library and a ladies' library, the latter possessing a fine new building. Pontiac carries on a large trade in wool, fruit, and farm produce, and is developing as an industrial centre, the manufactures including buggies and wagons, farm machines, gas and gasoline en-

gines, foundry products, bicycles, pumps, flour, lumber products, knit goods, etc. The water-works are owned and operated by the municipality. Named in honor of the famous Indian chief, Pontiac was settled in 1818, and was chartered as a city in 1861 (having been incorporated as a village in 1837). Population, in 1890, 6200; in 1900, 9769.

PONTIANAK, pŏn'té-á-nák'. The chief town of the Dutch possession of West Borneo, situated on the western coast of the island, right under the equator (Map: East Indies, C 4). It is one of the principal ports of Borneo and the seat of a Dutch resident. Its population is estimated at 9000.

PONTIANUS, pŏn'shí-á'nūs, SAINT. Pope, 230-235. He took part in the controversy between Origen (q.v.) and Demetrius, favoring the latter. The greater part of his pontificate fell under the reign of Alexander Severus, who was well disposed toward the Christians, but a new persecution broke out on the accession of Maximin, and Pontianus was banished to Sardinia, where he died from harsh treatment.

PONTICELLO, pŏn'té-ché'lŏ (It., little bridge). In music, the bridge of a bow instrument. *Sul ponticello* is the direction given to violinists to play with the bow near the bridge, which produces a hard, sharp tone. The opposite of *sul ponticello* is *flautando*, which calls for a clear, sweet flute-like tone produced by drawing the bow across the string at some distance from the bridge.

PONTIFEX (Lat., probably from *pons*, bridge + *facere*, to make). The title borne by the members of one of the four great priestly colleges among the Romans. The other three were the *collegia augurum* (see AUGURIES), XV. *virorum sacris faciundis*, and VII. *virorum epulonum*. The last two were of younger origin, as the former (at first of two, then ten, and after Sulla of fifteen members) was instituted to have charge of the Sibylline books and the oversight of the foreign cults, classed as *Græcus ritus*, while the latter (of three, seven, and ten members) relieved the pontifices of their duties in connection with the sacrificial banquets of the Roman and plebeian games. The *collegium pontificum* in its widest and technical meaning included several elements. Besides the *rex sacrorum*, who had succeeded to the priestly duties of the King, the flamines (see FLAMENS), and the six vestal virgins, there were the pontifices, properly so called, whose number increased from three to six, nine, fifteen and sixteen. At their head was the *pontifex maximus*. This college was the guardian of all the ceremonial attending the worship of the ancient Roman gods (*patrius ritus*). It had charge of the calendar; its members alone possessed the prayers and rites needed for the proper performance of religious ceremonies; they were consulted as to the necessary rites which the appearance of prodigies might require from the State or individuals, and by their replies established a large body of law affecting religious observances and duties, based upon the mass of precedent with which they were familiar. From their number the *pontifex maximus* was elected, after B.C. 212 and perhaps earlier, by an assembly of seventeen tribes chosen by lot. He was, as it were, the legal embodiment

of the collective body of pontifices, and possessed over the other members of the great college an authority which preserves plain traces of original absolutism. The pontifices filled vacancies by their own vote, but the rex and flamines were appointed, even against their will, by the pontifex maximus, though in later times his choice was limited by a list of nominations. The vestals also were originally chosen by him, though later the lot decided from twenty names of his choosing. He had the power to fine his colleagues, and even to remove the rex and flamines. To the vestals he stood in the position of a father, and could use corporal punishment, though the death penalty for unchastity could only be inflicted by the college. In the time of the Empire this office regularly belonged to the prince, and a *promagister* was named to preside over the college. The pontifices are among the oldest Roman officials, evidently belonging to the regal period, as a council of the monarch. Their importance is shown by the fact that with the augurs they are the only priests regularly provided for the colonies. Originally all the pontifices were patricians, but in B.C. 300 the Lex Ogulnia provided that five of the nine pontifices and of the nine augurs should be plebeians. Later, when the numbers were increased, the majority seem to have been drawn from patrician families. Even with the growth of Christianity the pontifices and vestals continued to exist, though the Emperor Gratian resigned the title of pontifex maximus, and it was not till the end of the fourth century that the edicts of Theodosius put an end to the forms of the old Roman religion. Consult: Mommsen, *Römisches Staatsrecht* (Leipzig, 1887-88); Marquardt, *Römische Staatsverwaltung* (2d ed., ib., 1884); Bouché-Leclercq, *Les pontifes de l'ancienne Rome* (Paris, 1871); Bardt, *Die Priester der vier grossen Collegien* (Berlin, 1871); Habel, *De Pontificum Romanorum inde ab Augusto usque ad Aurelianium Condición Publica* (Breslau, 1888); Wissowa, *Religion und Kultus der Römer* (Munich, 1902).

PONTIFICAL (ML. *pontificale*, book of offices, from Lat. *pontificalis*, relating to a pontiff, from *pontifex*, high priest). The name in Roman Catholic usage of the book containing the several services, whether in the administration of sacraments, or the performance of public worship, in which the bishop exclusively, or at least a priest delegated by the bishop, officiates. There were many such collections for the various national churches; but that which is now in universal use throughout the Western Church is the *Pontificale Romanum*, edited by the Papal master of ceremonies Burchard and published at Rome in 1485. It was revised by Clement VIII. and its use extended to the whole Latin Church in 1596. The current edition is that published at Regensburg in 1888 by authority of Leo XIII. Another of the service books of bishops is called the *Ceremoniale Episcoporum*, but it is chiefly confined to a description of the peculiar ceremonial with which bishops are required to celebrate solemnly those offices, as of the mass, vespers, and the funeral office, which are common to them with priests.

PONTIFICAL STATES. See PAPAL STATES.

PONTIGNY, pôn'té'nyé'. A village in the Department of Yonne, France, 32 miles southwest of Troyes (Map: France, K 3). Popula-

tion, in 1901, 778. It is noted for its extensive Cistercian abbey, founded by Count Thibaud of Champagne in 1150, and frequently the asylum of the Archbishops of Canterbury when at variance with the English kings. Thomas à Becket found refuge there in 1164, Stephen Langton in 1208, and Edmund Rich in 1239. The abbey and church were much damaged by the incendiarianism of the Huguenots in 1568. It has been restored, is now a national monument and a pilgrimage resort, especially of British Roman Catholics. The church is one of the most perfect survivals of unadorned early Gothic. Its length is 360 feet; width of nave, 73 feet; length of transepts, 150 feet; interior height, 70 feet. Some of its distinctive features are a small open narthex and the narrow lancet-shaped windows.

PONTINE MARSHES (Lat. *Pomptinæ Paludes*). A low-lying district, forming the southern part of the Campagna di Roma (q.v.), and extending in a southeasterly direction from Cisterna to the sea at Terracina. Its greatest length is about thirty-one miles, and its breadth from five to eight miles. It does not reach the seacoast on the west, being separated from it by a broad sandy tract covered with forest; but even this barrier partakes to some extent of the character of the marshes themselves, being quite as flat, and largely intermixed with swamp and lagoon. The Pontine Marshes have undoubtedly been formed by the stagnation of the streams that take their rise in the Volscian hills, and by the accumulation of sand along the shore from Astura to the Circeian promontory, but this formation undoubtedly belongs to prehistoric ages. The first attempt to drain the Pontine Marshes in ancient times was made in B.C. 160 by the consul Cornelius Cethegus; but his efforts were only partially successful. Julius Cæsar projected the drainage of this pestilential district, but his murder prevented the complete realization of his project. Augustus also appears to have done something; but in the time of Juvenal it was a mere haunt of robbers. Theodoric the Goth likewise tried to reclaim it; but the desolations of succeeding reigns soon reduced it to a hopeless condition, and it remained an uninhabitable region. The first in modern times to resume the labors of the ancients was Pope Boniface VIII., who drained the district about Sezze and Sermoneta by means of a large canal. Several subsequent efforts were made, but nothing was really accomplished till the time of Pope Pius VI., who, in 1778, commenced to drain the marshes, and completed the drainage in ten years. The reclamation of the land, however, has been found possible only in part. Though much is under cultivation and in pasturage, a great portion is hopelessly irreclaimable, and the whole region is so unhealthy that during the summer months the inhabitants are obliged to remove to the neighboring mountains. Consult: Prony, *Description hydrographique et historique des Marais Pontins* (Paris, 1823); De la Blanchère, *La malaria de Rome et le drainage antique* (ib., 1884); Berti, *Le Paludi Pontine* (Rome, 1884); Donat, *Le Paludi Pontine ed il loro prosciugamento* (ib., 1887).

PONTMARTIN, pôn'mär'tän', ARMAND FERRAND, Count de (1811-90). A French author, born at Avignon, and educated in Paris. He en-

tered journalism in 1830, and later became a critic and satirist. His best works were *Causeries littéraires* (1845-56); *Causeries du Samedi* (1857-81); *Semaines littéraires* (1861-63); and *Souvenirs d'un vieux critique* (1881-89). In these, in his *Mémoires* (1885-86), and in his many novels he showed himself a master of a brilliant style.

PONTOIS, pôn'twü', JEAN FELIX HONORÉ (1837—). A French lawyer and author, born at Thouars. At the age of thirty-one he was made a judge of the tribunal at Ancey and was transferred to the tribunal of Algiers in 1874, finally becoming president of the tribunal of Tunis in 1883. In 1886 he became president of the division of the Court of Appeals at Nîmes, holding that office for three years. On his resignation he engaged in political work against the Boulangists, and published books and articles bearing on political topics. He was honored by membership in the Legion of Honor. One of his best known works is *Réforme du code d'instruction criminelle et au code pénal* (Paris, 1871). He has published a number of other legal works, and also some dramatical works.

PONTOISE, pôn'twüz'. The capital of an arrondissement in the Department of Seine-et-Oise, France, 17 miles northwest of Paris by rail, at the confluence of the Oise and the Vienne (Map: France, H 2). The town rises from the Oise in an amphitheatrical form on a hill crowned by the twelfth-century Gothic Church of Saint Maclou. The Church of Notre Dame, the Hôtel de Ville, museum, and hospital are also notable buildings. There are remains of mediæval fortifications. Pontoise has a considerable commerce in grain, and manufactures mill machinery, chemicals, and hosiery. It was the Roman *Briva Isaræ*, a village antedating the Roman Conquest, and was destroyed by the Northmen in the ninth century. It became the capital of the Vexin Français, and was the frequent residence of the Capetian kings. Population, in 1901, 8180.

PONTOON'. See BRIDGES AND DOCKS, MILITARY.

PONTOPPIDAN, pôn-tóp'é-dán, ERIK LUDVIGSEN (1698-1764). A Danish prelate. He was born at Aarhus, Jutland, and studied theology as well as geography and history at the University of Copenhagen. He was made chaplain to the King in 1735; professor of theology at Copenhagen in 1738; bishop of Bergen, Norway, in 1748; chancellor of the University of Copenhagen in 1755. He was a learned man and the leader of the Pietists in Denmark. Among his numerous publications were: *A History of the Church in Denmark* (1741-47); *A Natural History of Norway* (1752-53; Eng. trans., London, 1755); and *An Account of the Geography, Natural History, and Antiquities of Denmark* (7 vols., 1763-81). His explanation of Luther's catechism was used as a text-book for many years in the schools of Denmark and Norway.

PONTOPPIDAN, HENRIK (1857—). A Danish novelist, born in Fredericia and educated at the University of Copenhagen. His first book, *Stakkede Vinger* (1881), immediately gained for him a prominent position among the younger Danish writers and marked him as a broad and accurate observer of social and political conditions among the Danish peasantry. His earlier

writing betrays imitation of the Norwegian novelist Kielland, but in *Fra Hytterne* (1887), *Pøkkelivsskildringer* (1888-90), and the trilogy *Muld* (1891), *Det forjættede Land* (1892), and *Dommens Dag* (1895), his originality and narrative power are strongly apparent. His other writings include *Sundingen Menighel* (1883) and *Landsbybilleder* (1884).

PONTOR'MO, JACOPO DA (properly JACOPO CARUCCI) (1494-1557). An Italian painter of the Florentine school, called Pontormo from the place of his birth. He was the pupil of Leonardo da Vinci, Albertinelli, Piero di Cosmo, and finally of Andrea del Sarto. The "Visitation," in the Church of the Annunciation, Florence, one of his best works, is in the style of the last-named master. But he was also influenced at different times by Dürer and Michelangelo. There is a "Holy Family" in the Louvre by him, and a "Joseph and His Brethren," a better work, in the National Gallery, London. Pontormo's excellent portraits include those of Andrea del Sarto, in the Berlin Museum; the portrait of a boy in the National Gallery, London; and that of a gem-cutter in the Louvre, Paris. The portrait of a cardinal in the Borghese collection, Rome, attributed to Raphael, is also said to be by him.

PONTREMOLI, pôn-trém'ò-lè. A town in the Province of Massa e Carrara, Italy, situated on the southern slope of the Apennines, on the Magra, 37 miles southwest of Parma (Map: Italy, D 3). It has a cathedral and an episcopal library. There are manufactures of silk, oil, and lime, and a trade in wine, fruit, and cattle. There are also marble quarries and mineral springs. Pontremoli was a republic in the twelfth century. Population (commune), in 1881, 12,601; in 1901, 14,194.

PONTRESINA, pôn'trà-zè'ná. A celebrated mountain resort in the Canton of Grisons, Switzerland, situated at an altitude of over 5800 feet on the road to the Bernina Pass. Population, in 1900, 483, chiefly Protestants.

PONTUS (Lat., from Gk. Πόντος). The ancient name of a district in the extreme northeast of Asia Minor, bordering on the Pontus Euxinus (whence its name), and extending from the river Halys (now Kizil Irmak) in the west to the frontiers of Colchis and Armenia, a short distance beyond the modern Batum, in the east. Its southern limits were the ranges of Anti-Taurus and Paryadres, so that it corresponded pretty nearly to the modern provinces of Trebizond and Sivas. On the east and south Pontus is mountainous, but along the coast there are large and fertile plains which in ancient times produced, and indeed still produce, abundance of grain, fruits, and timber. Game, according to Strabo, who was a native of Amasia, was also plentiful. Apiculture was common, and honey and wax were among the chief articles of commerce. Iron was the principal mineral. Besides the Halys at the west, the chief rivers were the Iris and its tributary, the Lycus, and at the east the Acampsis. Small, but famous from its association with the Amazons, was the Thermodon.

Pontus was not an ethnological, but purely a geographical, division. The name does not occur before the fourth century B.C., and is not common

till after the time of Alexander the Great. Properly, the region was called Cappadocia ad Pontum. The early inhabitants seem to have been barbarous but warlike tribes, over whom the monarchs of Assyria, Lydia, and even Persia had but little more than a nominal control, though the region formed one of the satrapies under Darius. The advantages of the fertile coast and the prospects of trade early attracted Greek merchants, and the Argonautic epic reflects the voyages of the early Æolian and Ionian traders. As early as the seventh century B.C. the Milesians had founded Sinope, and that city and Miletus planted a number of settlements along the Pontic coast, of which the most famous was Trapezus (Trebizond); others were Amisus (Samsun), Cotyora, and Cerasus (near the later Pharnacia). In the interior were native cities which later attained prominence, such as Amasia, the old capital and burial place of the earlier kings; Comana Pontica, the chief seat of the worship of the Asiatic goddess Ma; and Cabira or Neocæsarea, the modern Niksar. Some of the earlier satraps or local princes seem to have assumed a royal title in the fourth century B.C., or at any rate were regarded as the founders of the dynasty, but the foundation of the Kingdom of Pontus was really laid by Mithridates III. Ctiste (or founder), who in B.C. 362 fled to this region from Antigonus. At first little more than a robber chief, he so skillfully used the disturbances of this time that in B.C. 280 he could assume the title of king. He seems to have died about B.C. 266, master of Paphlagonia and Northern Cappadocia, though Sinope was still independent. He was succeeded by his son, Ariobarzanes III., who was followed by Mithridates IV., and Pharnaces I., who took Sinope and removed the inhabitants of Cotyora and Cerasus to his new city of Pharnacia. He was, however, forced by the Romans to give up most of his Paphlagonian conquests. To him succeeded Mithridates V., and about B.C. 121 the great Mithridates VI. Eupator (see MITHRIDATES), one of the most dangerous opponents of Roman rule in the East, ascended the throne. After his overthrow, B.C. 63, by Pompey, his kingdom was divided. The portion west of the Halys was joined to the Province of Bithynia. Next to this district the valley of the Iris and the region inland were given to King Deiotarus, and from that time were known as Pontus Galaticus. The eastern region was given to other princes, and later the central portion was given by Antonius to a certain Polemon, whence it was called Pontus Polemoniacus. It was ceded to Rome during the reign of Nero, and at first joined to Galatia. Later both divisions of Pontus were joined to Cappadocia, and in the redistricting of the Empire by Constantine it formed two provinces. The narrow eastern strip along the Black Sea was called Pontus Polemoniacus, while the western district, extending to the highlands of Cappadocia, was named Hellenopontus. Consult: E. Meyer, *Das Königreich Pontus* (Leipzig, 1879); T. Reinach, *Trois royaumes de l'Asie Mineure* (Paris, 1888); and *Mithridate Eupator, roi de Pont* (Paris, 1890).

PONTUS EUXINUS. The ancient name of the Black Sea (q.v.).

PONTYPRIDD, *Welsh pron.* pŏn'tŏ-prĭth' (*Welsh, Bridge of Beauty*), also called NEW-

BRIDGE. A town in Glamorganshire, Wales, on the Taff, 11 miles southeast of Merthyr Tydfil (Map: Wales, C 5). The municipality owns gas works and abattoirs, maintains libraries and recreation grounds, and is instituting numerous improvements and public industries. Its growth and importance are due to its various manufactures, collieries, iron mines, and supplemental industries. Pontypridd is named from the famous bridge built by a self-taught architect over the Taff in 1755. Population, in 1891, 15,400; in 1901, 19,460.

PONY (probably from Fr. *poulenet*, diminutive of *poulain*, from ML. *pullanus*, foal, colt, from Lat. *pullus*, young animal, chicken; connected with Gk. πῶλος, *pōlos*, foal, and ultimately with Eng. *foal*). A small horse. The name pony is commonly applied to the many small active breeds of horse (q.v.) which are to be found throughout the world, more especially in the warmer parts and in mountainous or sterile regions. In general they are exceptionally hardy and possess a strength great in proportion to their size. Possibly the smallest race of ponies is the Shetland, although the Iceland pony differs but little from it and is sufficiently hardy to flourish in the winter of Iceland. The Galloway, Welsh, Dartmoor, Exmoor, and Canadian breeds are types of ponies considerably larger than that of Shetland. Sardinia and Corsica also possess small races of pony, which have existed unchanged from ancient times.

PONY EXPRESS. The name given to a mail service established between Saint Joseph, Mo., and San Francisco, Cal., in 1860. At this time there were three transcontinental mail lines, but the greater part of the mail between the east and the far west was sent by way of Panama, in about twenty-two days. The demand for a more rapid mail service between the east and the west led to the establishment in the spring of 1860 of the famous "Pony Express," the mail being carried rapidly overland on horseback under the direction of the Central Overland California and Pike's Peak Express Company. The first pony express left, on April 3, 1860, Saint Joseph and San Francisco, between which places the schedule allowed 8 days. Stations averaging at first 25 miles apart were established, and each rider was expected to cover 75 miles per day. Eventually there were 190 stations, 200 station-keepers, 200 assistant station-keepers, 80 riders (who were paid from \$100 to \$125 per month), and between 400 and 500 horses. The quickest trip was that made for the delivery of President Lincoln's inaugural address, the distance between Saint Joseph, Mo., and Sacramento, Cal., 950 miles, being covered in 7 days and 17 hours. At first the company charged \$5 for each half ounce, but later the charge was reduced to \$2.50. The regular pony express service was discontinued upon the completion of the line of the Pacific Telegraph Company, in October, 1861. The service was often interrupted by Indian hostilities, and was extremely hazardous for riders and station-keepers alike. Consult an article in *The Century Magazine*, vol. 34 (New York, 1898).

PONZ, pŏnth. ANTONIO (1725-92). A Spanish archaeologist, painter, and art critic. He was born at Bexis, and was sent to Valencia and to Gandia to study letters and philosophy, but became an art-pupil of Richart in the former

city, and studied in Madrid and (1751-60) in Rome. Upon his return to Spain he was ordered to paint portraits of Spanish authors for the Escorial. His other paintings are mostly copies of Callari and Reni. About 1770 he was sent on his great tour of Spain to collect paintings and statuary from the convents which the Jesuits had just been forced to leave. His chief work is the description of this mission, *Viage de España* (1771-94; completed by his nephew), which, besides art criticism, gives a complete account of social conditions of the times. Ponz wrote, on his travels in France and England, a *Viage fuera de España* (1785). His criticism of architecture is particularly valuable.

PONZA (pôn'tsá) **ISLANDS**. A group of small islands, of volcanic origin, belonging to Italy, situated west of Naples, in the Mediterranean Sea, in about longitude 13° E. (Map: Italy, G 7). There are in fact two groups. The western and larger belongs to the Province of Caserta, the eastern to the Province of Naples. They are used as penal settlements. To the former collection belongs Ponza, the largest island, with 4560 inhabitants in 1901. The latter group consists of two islands, with a population of 1859 in 1901. The islands served the Roman Emperors as a place of banishment.

POOD (Russ. *puđū*, from Lat. *pondus*, weight). A Russian weight equal to 40 Russian pounds or 36.112 pounds avoirdupois.

POODLE (Ger. *Pudel*, from Ger. *puđeln*, to splash in water; connected with LGer. *puđeln*, *puđeln*, to waddle, Eng. *puddle*, pudgy person). A breed of long-haired domestic dogs now kept chiefly as pets. The poodle has long been known and appreciated; his quaintly clipped and shaven body is found depicted on Roman sculptures. From Italy he was introduced into Spain and France, and thence into England. He is not only naturally a good retriever or water-dog, but has the nose and sudden stop of both the pointer and setter; indeed, so keen is his nose that even the inferior kinds, or patched dogs, are employed by the poor natives of Hampshire and Wiltshire in England to hunt for and point out truffles—a faintly smelling fungus formerly much affected as a relish. His remarkable general intelligence is indicated by his predominance in every band of trick and performing dogs in the world. Three varieties are recognized—the red, the white, and the black; and two classes of covering—'corded' and 'curly.' Their weight is divided, for competitive purposes, into three grades: Large size, over 40 pounds; medium, 20 to 40 pounds; small, 20 pounds or under; and the last grade are sometimes called 'barbets.' The general appearance is that of a strong, active, stylish, playful, and intelligent dog, well built, and covered with thick, close curls of a silky texture, or with strong, hanging, rope-like cords, sometimes measuring 25 inches long, as in the case of the recent champion 'Nero.' The poodle has a long, capacious skull, the parts over the eyes well arched; good level teeth; a strong neck; muscular, straight fore legs and hind legs with hocks well let down; strong, well-proportioned and well-padded feet; and a tail carried well up. The ears are long, well set, and lie close to the cheek; and the eyes black and vivacious. The little white-coated, short-haired, curly poodle, with whose covering the least liberties

have been taken, is the widest known of the three varieties, although not the most popular on the show bench. These are essentially family pets, and their quizzical, whiskered faces are in evidence in every country from California round the world eastward to China, where this breed is still used in his ancient hunting capacity as 'a water-dog.' See Plate of Dogs.

Poodles are usually clipped over the larger part of the body, leaving the cords or curls here and there after a pattern dictated by the caprice of the master. A favorite style has always been to leave the head and foreshoulders unshorn, and this style may have had a reasonable origin in the improvement of the dog for sport by freeing his body from the long coat. That the fashion of clipping has been long continued is evident from this dog's appearance in the pictures of a long range of artists from Van Eyck, Albert Dürer, and Hogarth down.

POOH-BAH. A comic opera character created by W. S. Gilbert in *The Mikado*, who has become proverbial for the many offices he fills.

POOL, THE. The upper portion of the harbor of London; the part of the Thames just below London Bridge, which forms the limit of navigation for sea-going vessels.

POOL, MARIA LOUISE (1845-98). An American writer, born in Rockland, Mass. She removed to Brooklyn, N. Y., in 1870, where she wrote first for a Philadelphia paper and afterwards for the *Evening Post* and the *Tribune* of New York. Later she resided in Wrentham, Mass. It was not until 1887 that she became independently known through her *A Vacation in a Buggy*. Her literary work, which consists of sketches, chiefly of New England life, and much of which appeared in the periodicals, was issued in book form as follows: *Tenting at Stony Beach* (1888); *Dolly* (1891); *Roveny in Boston* (1892); *Mrs. Keats Bradford* (1892); *Katharine North* (1893); *The Two Salomes* (1893); *Out of Step* (1894); *Against Human Nature* (1895); *Mrs. Gerald* (1896); *In the First Person* (1898); *Boss and Other Dogs* (1898); *A Golden Sorrow* (1898); and *The Malvon Farm* (1899).

POOLE. The chief seaport of Dorsetshire, England, on the east coast of the county, five miles west of Bournemouth (Map: England, E 6). Its harbor is tidal and has a quayage of 2000 feet. Poole is an ancient town and a municipal county. The town owns much corporate property, has built an esplanade and shore drive, carried out harbor improvements, and established a free library. It has manufactures of sailcloth, tiles, ropes, etc., and a considerable coasting trade, and exports Purbeck clay and grain. The town is named after the pool or bay on which it stands, and which at high tide covers an area seven miles long by four and one-half broad. Population, in 1891, 15,400; in 1901, 19,500.

POOLE, JOHN (c.1786-1872). An English writer, the author of several popular farces. He also wrote novels, essays, and character sketches, some of which were republished in the United States. He is best known for his plays, *Paul Pry* (1825), *Deaf as a Post* (1823), and *Twixt the Cup and the Lip* (1826), and for his satire, *Little Pedlington and the Pedlingtonians* (1839). His other publications include: *Phineas*

Quiddy, or Sheer Industry (3 vols.); *Sketches and Recollections* (2 vols.); and *Village School Improved, or Parish Education*. The unflinching flash of his wit and the originality of his ideas secured for his works a popularity which some of them still retain. In his old age he received, chiefly through the influence of Charles Dickens, a pension of £100 from the civil list.

POOLE, or POLE, MATTHEW (1624-79). An English biblical scholar, born in York and educated at Emmanuel College, Cambridge. After taking the degree of B.A. in 1649 he became rector of Saint Michael-le-Querne, London. A staunch Presbyterian, he resigned his living on the passage of the Uniformity Act (1662). Having a small but independent income, he was now able to devote himself to his great undertaking, *Synopsis Criticorum Aliorumque Sacra Scriptura Interpretum* (5 vols., 1669-76). This Latin work, which busied him for ten years, is a summary of the critical labors of Rabbinic and Roman Catholic commentators, but contains little from Calvin and nothing from Luther. Poole also began a synopsis in English, called *Annotations Upon the Holy Bible*. Two volumes, reaching Isaiah lviii., appeared in 1683-85. The work was continued by others (last edition, 3 vols., 1840). Frightened by the Popish plot—for Titus Oates, on account of Poole's tract on the Nullity of the Romish Faith, had represented him as marked for assassination (1678)—Poole left England and passed his last years at Amsterdam.

POOLE, REGINALD LANE (1857-). An English historian, born in London, and educated at Balliol and Wadham colleges, Oxford, and at the University of Leipzig. In 1880 he became assistant in the department of manuscripts in the British Museum. Upon the establishment of the *English Historical Review* in 1885, he was appointed an assistant editor, and afterwards acted as joint editor with Gardiner, and then as sole editor. He was appointed lecturer in modern history at Jesus College in 1886, and was long lecturer on diplomacies in the Oxford University. Poole contributed largely to the *Encyclopædia Britannica* and to the *Dictionary of National Biography*, especially on subjects in mediæval history and on music; wrote *The Huguenots of the Dispersion* (1880); *Sebastian Bach* (1882); *Illustrations of the History of Mediæval Thought* (1884); and *Wycliffe and Movements for Reform* (1889); and edited the catalogues of coins in the British Museum; Wielif's *De Civili Dominio* (1885) and *De Dominio Divino* (1890); an *Historical Atlas of Modern Europe* (1897-1902); and, with M. Bateson, *Bale's Index Britannicæ Scriptorum* (1902).

POOLE, REGINALD STUART (1832-95). An English Egyptologist, born in London. He was educated in Cairo by his uncle, Edward William Lane; became assistant in the department of antiquities in the British Museum in 1852; was soon transferred to the department of coins and medals, of which he became keeper in 1870; assisted Amelia B. Edwards in establishing the Egypt Exploration Fund; lectured to the Royal Academy students in 1883-85; and in 1889 became professor of archæology in London University College. He wrote much concerning Greek and Oriental coins during his connection with the British Museum; contributed to Smith's *Bible Dictionary* and to the *Encyclopædia Britan-*

nica; and wrote the descriptive parts of Firth's *Views in Egypt*.

POOLE, STANLEY LANE. See LANE-POOLE.

POOLE, WILLIAM FREDERICK (1821-94). An American librarian. He was born in Salem, Mass., and graduated at Yale in 1849. While at college he was librarian of the Brothers in Unity Society Library, and in his junior year compiled the first edition of his *Index to Periodicals*. He was librarian of the Boston Mercantile Library, 1852-56; then became librarian of the Athenæum, where he remained thirteen years, becoming well known as one of the leading librarians of the country. He was in charge of the Cincinnati Public Library in 1869-73; of the Chicago Public Library in 1873-87; and of the Newberry Library, Chicago, from 1887 till his death. Dr. Poole was most widely known for his admirable *Index to Periodical Literature*, of which he published enlarged editions in 1853 and in 1882. The later edition and several supplements have been compiled by the coöperation of many American librarians, and other volumes have been edited by W. J. Fletcher, librarian of Amherst College. Dr. Poole was much interested in the study of American history, and in 1887 was elected president of the American Historical Association. His writings include: *The Battle of the Dictionaries* (1856); *Websterian Orthography* (1857); *Cotton Mather and Salem Witchcraft* (1869); and *Anti-Slavery Before 1800* (1887). He organized the Bronson Library, at Waterbury, Conn. (1869); the Athenæum Library at Saint Johnsbury, Vt.; and the library of the United States Naval Academy.

POOLING (from *pool*, from Fr. *pouls*, pool, stakes, hen, from ML. *pulla*, hen, from Lat. *pulus*, young animal, chicken). A division of business or of the proceeds of business among otherwise competing carriers or other parties, intended to minimize the effects of competition by maintaining rates. Pools may be divided into four classes; a *division of traffic* may be either (1) a division of the field, where the business of a particular territory is assigned to each competitor, or (2) a tonnage pool, where a certain percentage of the competitive business is assigned to each. A *division of revenue* may be either a (3) gross or (4) net money pool, according to whether it is based upon gross or net receipts. A net money pool almost necessarily involves a system of joint accounting, and is therefore a close form of combination.

Railway pooling became a matter of importance in England about 1850, but its origin is obscure. The first railway pools in the United States were probably among the New England railways, but it was in the West that pooling first became a matter of public importance. Both freight and passenger traffic between Chicago and Omaha were pooled in 1870, and the arrangement remained in force, with but one short interruption, for 17 years, the pool being merged in 1884 in the Western Freight Association. The principal roads carrying anthracite coal to the Atlantic seaboard, which also owned about 75 per cent. of the anthracite coal fields, had an effective pooling arrangement from 1872 until 1876. In 1873 the roads from Atlanta to the coast formed a pool out of which afterwards grew the strong Southern Railway and Steamship Association. The lines from Chi-

ago and Milwaukee for Saint Paul arranged a money pool for both freight and passenger traffic in 1874. During the next few years numerous pools were organized, until they covered nearly every part of the country.

Railway freight pooling was forbidden and made a misdemeanor by the Interstate Commerce Act passed in 1887, but the wisdom of this prohibition was and has continued to be a much mooted question. (See INTERSTATE COMMERCE ACT.) Most students of the subject, both practical and theoretical, favor the legalization of pooling under governmental supervision. Pooling prevents discrimination and is conducive to stability of rates, which is generally considered more important than absolute lower rates. It is argued that when the division of competitive traffic is as certain as that of non-competitive traffic both will be treated without discrimination, for there will be no reason for favoring competitive points; through traffic will then be made to bear its just share of the cost of transportation.

Upon the passage of the Interstate Commerce Act existing pooling contracts were annulled, but the attempt to prevent pooling has not been altogether successful. Traffic associations have endeavored to continue the division of traffic without resorting to the usual pooling machinery. There is abundant evidence of a physical division of cotton freight from Memphis and other interior points to the seaboard; indeed, this pool has been sustained by the Supreme Court of Tennessee. It does not fix rates, but all the roads concerned accept the lowest rate to Liverpool prevailing on any given day. There is said to be a somewhat similar division of the fruit traffic from southern California. The so-called Buffalo grain pool, which was investigated by the Interstate Commerce Commission in 1900, was intended to divide the grain traffic from Buffalo to New York and to maintain a rate of 4 cents a bushel.

At common law, the American courts have usually held pooling agreements to be contracts in restraint of trade, and against public policy. Pools have therefore been extra-legal agreements not enforceable by the courts, but dependent upon the good faith of the parties, and hence lacking in permanence. In England the courts look upon pooling with much less disfavor than in the United States; while on the Continent pooling is regarded with such favor that the Government railways of Prussia, Austria, and other countries maintain pooling arrangements with competing water routes.

Pooling is not confined to transportation lines. The Western Elevating Association is an organization of grain elevators at Buffalo which establishes uniform rates for elevating and storing grain, collects the earnings, and after deducting expenses, distributes the remainder to the participating elevators in certain specified proportions, based upon their working capacity and the business they control. Manufacturing concerns sometimes form pools for the purpose of keeping up prices by limiting production.

The term pool, or pooling, is applied also to various other forms of combination for concerted action. In a Wall Street or stock pool stockholders of a company assign their stock to a firm of bankers or brokers to be sold within a given

time, usually at not less than a stated price, otherwise the stock is to be returned to the holders, the profits, if any, being shared by all alike. Receivers of farm produce in the Cincinnati market have formed 'pools' for economy in handling the goods, fewer salesmen being required by this method.

Consult: Cooley, *Popular and Legal Views of Traffic Pooling* (Chicago, 1884); Hadley, *Railroad Transportation* (New York, 1885); Seligman, "Railway Tariffs and the Interstate Commerce Law," *Political Science Quarterly* (1887); Hadley, "Prohibition of Railway Pools," *Quarterly Journal of Economics* (January, 1890); Newcomb, *Railway Economics* (Philadelphia, 1898); *Report of the Industrial Commission*, especially vol. xix.

POOL-SELLING. A method of distributing chances in a common 'pool' or combination of stakes on some uncertain event, as a horse race. For example, in a pool on a horse race, each bettor pays in a certain amount, naming the horse he desires to 'back' and receiving a ticket as a receipt, and on the determination of the race the winner is paid the total amount wagered by all the bettors on the race, less a commission, usually 10 per cent., which is retained by the manager or person selling the pools. The term is also sometimes inaccurately applied to the method of betting with bookmakers in places at a distance from the racetrack. Pool-selling and the keeping of pool-rooms are prohibited in most States.

POONA, पो०ना. The capital of a district in Bombay, British India, on the river Mutha, near its confluence with the Mula on an almost treeless plateau, about 74 miles southeast of Bombay (119 miles by rail) (Map: India, B 5). Poona is about 1700 feet above the sea level; its climate is healthful and pleasant, and it is very much resorted to, particularly in the rainy season. The city, the former capital of the Mahrattas, is divided into seven quarters, named after the days of the week, and contains the ruins of a palatial structure, formerly the residence of the peshwa. It is the headquarters of the Bombay army and the seat of the Bombay Government from July to November. The cantonment for the infantry and horse artillery is two miles east of the city. The cantonment for the cavalry is at the village of Kirkee, about two miles to the northeast. The Deccan College, founded in 1821, has a staff of European professors with native assistants, and is a high class institution for the study of English, Marathi, and Sanskrit. There are numerous other educational institutions, including the Government College of Science, the Maharashtra College, and the Fergusson College. One of the most interesting objects in the neighborhood of Poona is a large *bund*, or embankment, solidly built of hewn stone over the Mutha-Mula River for the purpose of providing a supply of water for the cantonment, and especially the bazaar or native town connected with it. It was built by Sir Jamsetjee Jeejeebhoy, distinguished for his charities. Poona was formerly a great mart for jewelry and precious stones, but this trade has quite ceased. The native manufactures have also been supplanted by the introduction of European piece-goods, and the principal commerce is in connection with grain and other agricultural produce. In recent years

Poona suffered severely from the plague, and from 161,390 in 1891, its population decreased to 111,385 in 1901. Poona is first mentioned in the sixteenth century. It became the Mahrattan capital in 1750; it was captured and destroyed by Nizam Ali in 1763, and later in the same year the combined forces of the peshwa and Sindhia were completely defeated here.

POONA-WOOD (Kanarese *ponne*). The timber of the poon trees (*Calophyllum Inophyllum* and *Calophyllum angustifolium*) of India, commonly used for planks and spars in ship-building. See CALOPHYLLUM.

POOP (OF. *poupe*, *poupe*, Fr. *poupe*, from Lat. *puppis*, stern of a ship). A light deck, raised above the main or upper deck, and extending a short distance forward from the stern. It is all that remains of the old stern castle which towered above the upper deck in ships of the seventeenth and several preceding centuries.

POOR, ENOCH (1736-80). An American soldier, born at Andover, Mass. He became a ship-builder at Exeter, N. H., but in 1775, after the battle of Lexington, raised a regiment, of which he was commissioned colonel. In 1777 he was promoted to be brigadier-general in the Continental Army, and had a conspicuous part in the battles of Saratoga, his brigade bearing the brunt of the action on September 19th. He also distinguished himself at Monmouth (June 28, 1778), and the next year, during Gen. John Sullivan's Indian campaign, led his troops in a difficult flank movement which resulted in the decisive victory at Newtown, the present Elmira (August 29, 1779). In 1780 he was transferred to one of Lafayette's two brigades of light infantry at that general's request, but soon afterwards died while stationed at Hackensack, N. J.

POOR, THE (OF. *poure*, *povere*, *povre*, Fr. *pauvre*, from Lat. *pauper*, poor). The term used to designate those for whom it is a struggle to procure the necessities of life. In law it has reference to those who are wholly or in part dependent on public support. See PAUPERISM; MEXICANCY; VAGRANCY.

POORE, BENJAMIN PERLEY (1820-87). An American journalist, born near Newburyport, Mass. His father sent him to a military school to prepare for admission to West Point, but he ran away and apprenticed himself to a printer. At the expiration of his service his father bought for him the *Southern Whig*, an Athens, Ga., newspaper. After only two years as editor, however, he accepted an appointment as attaché to the United States legation in Brussels. During the following seven years he visited the principal countries of Europe, Egypt, and Palestine, and acted as foreign correspondent of the *Boston Atlas*. During the last four years he acted also as an historical agent for Massachusetts in France, copying from the French archives many papers of historical value and illustrating them with maps and sketches. After his return to America in 1848 he edited the *Boston Bee* and *Sunday Sentinel*, and in 1854 became the Washington correspondent of several newspapers. For a short time during the Civil War he served as major of the Eighth Massachusetts Volunteers, but soon returned to his journalistic work, at which he continued until 1884. During these years he was for a long period clerk of the Senate Committee

on Printing Records, and in this capacity compiled and edited several publications dealing with the Government, including *The Political Register and Congressional Directory* (1887); *The Conspiracy Trial for the Murder of the President* (1865); and a *Descriptive Catalogue of the Government Publications of the United States, 1774-1881* (1885). In addition he published, among other works: *Perley's Reminiscences of Sixty Years in the National Metropolis* (2 vols., 1886); *Rise and Fall of Louis Philippe* (1848); *Life of General Taylor* (1848); and *The Life and Public Services of Ambrose E. Burnside* (1882).

POORE, GEORGE VIVIAN (1843-). An English physician. He was born at Andover, was educated at the New Cross Royal Naval School, and at University College, London, and served as surgeon on the *Great Eastern* when the Atlantic cable was laid (1866). His ability early attracted attention. In 1870 he was named attendant to Prince Leopold, Duke of Albany, and in 1872 he received the Dannebrog for his services to the Duchess of Cumberland. Physician of University College Hospital (1876), he was appointed professor of medicine and clinical medicine in University College. Poore translated selections from Duchenne (1883), and wrote on sanitation and medical law, *London, Ancient and Modern, from the Sanitary Point of View* (1889), *Essays on Rural Hygiene* (1893), and *A Treatise on Medical Jurisprudence* (2d ed. 1902).

POORE, HENRY RANKIN (1859-). An American figure and animal painter, born in Newark, N. J. He was a pupil of the National Academy of Design in New York City, and of the Pennsylvania Academy of Fine Arts, under Peter Moran, and afterwards studied in Paris with Lumenais and Bouguereau. He became one of the few American painters to devote himself to animal subjects, especially dogs. His composition is vigorous, his color pleasing, and his treatment sympathetic. Among his works are "Close of a City Day" (1888), "The Ploughing of the Ephrata Brethren" (1894), "Hounds in Winter" (1898), and "Clearing Land" (1903). His publications include *Pictorial Composition and the Critical Judgment of Pictures* (1903), a valuable book for students and professionals, the fruit of several years' teaching. He received the second Hallgarten Prize in 1888, in which year he was elected an associate of the National Academy of Design; the \$2000 annual prize of the American Art Association in 1889; and a bronze medal at the Pan-American exhibition.

POOR LAWS. The laws regulating the public relief of the poor. Charities may be provided in two ways: by private initiative, as in the case of the Friendly Societies in England, or directly by the State. This latter relief is of many kinds, including the almshouse for those permanently indigent or disabled, the workhouse in case of confirmed mendicancy, and temporary outdoor aid for the casual poor. There seems to be a growing inclination on the part of the nations to make poor relief a public obligation, either by directly assuming the responsibility or by more closely regulating private efforts. There has also been a steady movement, during the last seventy five years, toward limiting the amount and scope of relief to the poor. The English legislation of 1834 and subsequent years, which practically abolished outdoor relief and threw the support

of bastard children upon the mother, strongly marks this tendency. For an extended discussion of the history of the poor laws in various countries, see PAUPERISM.

POOR RATE. The name of the tax raised in England for the maintenance of the public poor relief. The first tax levied for this purpose was in 1573. The assessment and collection were in charge of the Overseers of the Poor (q.v.). The earlier levies seem to have been on the basis of the number of acres owned, but later degrees of value were recognized. The Overseers were made subject to the courts and their assessment had to be countersigned by two justices. Great inequalities arose in the different parishes, and no fixed basis of assessment was reached until 1836, when the Parochial Assessment Act (6 and 7 William IV.) established the principle that the "net rent is the standard of ratable value." This act was permissive only, but in 1845 the justices were empowered to appoint an assessment committee, for the purpose of determining the county rate. Owing to the varying contributions of the different parishes, the law of 1861 (24 and 25 Vict., c. 55) made the share of each parish to accord with its ratable value, and in 1862 the Union Assessment Committee Act was passed. This required the Guardians to appoint a committee, to which the Overseers of each parish submit their lists of property. These lists are made public, and property-owners are given a chance to appear and to appeal. The list given out by this committee becomes the basis for levying the rate. In 1867 a special act was passed to meet conditions in London. In 1896 the amount raised by the poor rates was £21,236,297, but of this £11,892,190 was turned over to other departments. See PAUPERISM; POOR LAWS. Consult Nicholls, *History of the English Poor Law* (London, 1854), third volume by Mackay (London, 1898).

POOR RICHARD'S ALMANAC. A popular almanac published by Benjamin Franklin in 1732, and continued for twenty-five years. As "Richard Saunders" Franklin supplied in his almanacs, of which 10,000 were sold yearly, a fund of proverbs, homely wisdom and common sense of the greatest practical value to the people of this country.

POOR ROBIN. The assumed name of the author of an almanac, first issued in 1662 and continued until 1776. It was ascribed wrongly to Robert Herriek, and is supposed to be the work of William Winstanley. Throughout the seventeenth century a number of publications were issued under the name of "Poor Robin," the most popular of which was *Poor Robin's Jest*s (1667).

POOR'S ROLL. In the law of Scotland, the list of litigants unable to pay the fees of court, and therefore allowed to sue *in forma pauperis*. This privilege is granted only after special application and satisfying the court of the poverty. The warrant is granted only upon advice of counsel that the proposed action is probably a good cause, and when granted remains in force for two years, and during that time the pauper is exempt from all fees of court, and has the gratuitous services of counsel and agents. See FORMA PAUPERIS, IN.

POOR-WILL. A small nightjar (*Phalænotilus Nutalli*) abundant on the Western plains

of the United States, named from its two-syllabled characteristic note. The plumage is peculiarly soft, and bronzy, or silver-gray. The poor-will lays white, unspotted eggs. Compare WHIR-POORWILL.

POPAYÁN, pō'pá-yān'. Capital of the Department of Cauca, Colombia. It is situated near the banks of the river Cauca, 225 miles southwest of Bogotá, in a wide and beautiful plain 6000 feet above the sea, and dominated by the volcano of Puracé (Map: Colombia, B 3). It has a cathedral and a college, and some manufactures of woollen goods. Population, about 10,000. Popayán was founded in 1536 by Belalcázar. In the eighteenth century it was an important commercial and gold-mining centre, and a mint was established there in 1749. It suffered much in the civil wars, and is now in decay.

POPE. See PAPACY.

POPE, ALEXANDER (1688-1744). An English poet, born in London, May 21, 1688. His father, a linen draper, withdrew from business about 1700, and settled at Binfield, in Windsor Forest; in 1716 he moved to Chiswick on the Thames, near London. The poet's mother was Edith Turner, who belonged to a Yorkshire family. The elder Pope was a Roman Catholic, and to this faith the poet also nominally adhered, thus debarring himself from a university career. He learned to read from an old aunt and received some education in two Catholic schools as well as from private tutors (Roman Catholic priests), but for the most part he taught himself. He read widely in English poetry and studied French, Italian, Latin, and Greek. Thus left to himself, he never became an accurate scholar. Soon after the death of his father (1717) he leased (1719) a house and five acres of land at Twickenham, on the banks of the Thames, whither he withdrew with his mother, to whom he was tenderly attached, and there he dwelt till his death. In the famous villa Pope was visited by the most celebrated wits, statesmen, and beauties of the day. He died May 30, 1744. In his tenth year Pope was stricken by an illness which distorted his frame and robbed him of his plumpness and his color. His physical infirmity, susceptible temperament, and incessant study rendered his life "one long disease." He was, Lord Chesterfield said, "the most irritable of all the *genus irritabile vatum*, offended with trifles, and never forgetting or forgiving them." Of his many quarrels, that with Addison was least justifiable. Yet when no disturbing jealousy, vanity, or rivalry intervened, Pope was generous and affectionate, as witness the long friendship with Arbuthnot, Gay, and Swift, and his devotion to his mother.

Pope was the most precocious of English poets. At the age of twelve he wrote the *Ode to Solitude* and a translation of the first book of the *Thebais* of Statius (not published till 1712); and at fourteen or thereabouts, an epic called *Alexander*, which he burned about 1717. By 1706 he had composed his *Pastorals*, which were first published in Tonson's *Miscellanies* in 1709. The smooth and melodious verses at once made Pope known. The experiment in the pastoral was followed by the *Essay on Criticism* (1711), which expounded the canons of taste; the *Messiah* (1712); *Windsor Forest* (1713), a descriptive poem, less artificial than the *Pastorals*; and the *Rape of the Lock* (first draft 1712; completed in 1714),

the most graceful, airy, and fanciful of Pope's poems. In 1714 appeared *The Wife of Bath*, imitated from Chaucer, from whom he also got *The Temple of Fame*. In 1717 Pope published a collection of his works, where first appeared the *Epistle of Eloisa to Abelard* and the *Elegy on an Unfortunate Lady*, his most noteworthy lyrics. Pope was already engaged on the work that was to give him solid fame. His translation of the *Iliad* was published in six volumes (1715-20). Out of the profits of the work he purchased and adorned his villa. The translation, though wanting in Homeric simplicity, naturalness, and primitiveness, is nevertheless a splendid piece of writing, judged apart from its original. The *Iliad* was followed by the *Odyssey* (1725-26), which was, however, mostly the work of William Broome and Elijah Fenton. Though a financial success, the *Odyssey* added nothing to Pope's fame. Pope now made his famous attack on Grub Street. The *Dunciad* was finished by 1727; but before publishing it Pope stirred up his enemies with the *Bathos*, or the *Art of Sinking in Poetry*, in the *Miscellanies* (March, 1728), written in conjunction with Swift and Arbuthnot. The *Dunciad*, in three books, first appeared on May 28, 1728, and was enlarged the next year. Pope took as his supreme dunce Lewis Theobald (q.v.), who had criticised an edition of Shakespeare that Pope had brought out in 1725. Around Theobald gyrated the other dunces. In 1742 Pope added a fourth book, dethroned Theobald and put Colley Cibber (q.v.) in his place. This long lampoon, though mean in spirit, is brilliant in style. Pope closed his poetical career with the *Moral Essays* (1731-38) and a group of satires called *Imitations from Horace* (1733-38). The former group contains the famous *Essay on Man*, a philosophical poem, in which is expounded the deism of Bolingbroke, taken back in the sequel, the *Universal Prayer*. To the latter group belongs the delightful *Epistle to Dr. Arbuthnot*.

Pope has been variously estimated. To his generation he seemed the greatest of English poets. This position was questioned by Joseph Warton, who, in his *Essay on the Genius and Writings of Pope* (vol. i., 1751), placed Pope below Spenser. And the later romantics, who laid the stress on the matter of poetry rather than on its technique, had doubts as to whether Pope was a poet at all. On his rank, a memorable controversy was started by W. L. Bowles in 1806. If, in the language of Wordsworth, "poetry is the breath and finer spirit of all knowledge," uttered in impassioned language, there is little poetry in Pope. He was hardly successful in *Eloisa* and the *Unfortunate Lady*, his two experiments in pathos. They are only the rhetoric of emotion. Likewise the *Rape of the Lock* is a poem of the fancy rather than of the imagination. Without deep feeling or great imagination, Pope yet possessed rare excellences. In execution he could be faultless. He evoked the melodies of the heroic couplet, and molded it to the expression of keen wit and epigram. His proverbial philosophy, so often quoted—as "A little learning is a dang'rous thing"—is likely to be false or only half true, for Pope himself was no thinker; but in the realm of satire, as represented by the *Imitations of Horace*, he is still supreme among the English poets.

Collective editions of Pope's *Works* have been edited by W. Warburton (1751), Joseph Warton

(1797), W. L. Bowles (1806), W. Roscoe (1824), and by W. Elwin and W. J. Courthope (10 vols., London, 1871-89). The last edition, by far the best, has superseded all others. Consult also the *Concordance to Pope's Works*, by Abbott (London, 1875); *Life*, by R. Carruthers (Bohn's Library, ib., 1857), and by L. Stephen (English Men of Letters, ib., 1880); and *The Age of Pope*, by Dennis (ib., 1894). For poems alone, consult the convenient Globe edition (London and New York, 1869), and the edition in three volumes, with memoir by Dennis (London, 1891).

POPE, FRANKLIN LEONARD (1840-95). An American electrician, born at Great Barrington, Mass. In the employ of the Russo-American Telegraph Company (1864), Pope made surveys in the country between British Columbia and Alaska. When this project fell through, he went to New York, formed a partnership with Edison, with whom he invented the stock-ticker, and, in 1872, invented the rail circuit for automatic control of block signals. An able patent solicitor, he was for some time attorney to the Western Union Telegraph Company. He was killed in his own house in Great Barrington, Mass., by an electric shock received from a powerful transformer. Pope edited the *Electrical Engineer* (1884 sqq.) and wrote *Modern Practice of the Electric Telegraph* (1871; revised, 1891) and *Life and Work of Joseph Henry* (1879).

POPE, JOHN (1822-92). An American soldier. He was born at Louisville, Ky., and was the son of Nathaniel Pope, who for many years was United States Judge for the District of Illinois. He graduated at West Point in 1842. After graduation he served as brevet second lieutenant in the topographical engineers, and in 1846 joined General Taylor in Mexico. He was brevetted first lieutenant for gallantry at the siege of Monterey and captain for services at the battle of Buena Vista. After the close of the war he conducted an expedition which explored the region of the Red River of the North; was on engineering service in New Mexico in 1851-53; and from 1853 to 1859 had charge of the work of surveying a route for the Pacific railroad. Upon the beginning of the secession movement Pope came out on the side of the North, and in the winter of 1860-61 delivered a number of Union speeches. For criticising the policy of President Buchanan in one of these speeches, he was summoned to appear before a court-martial, but the trial never took place. In May, 1861, he was appointed a brigadier-general and was given command of the District of Northern Missouri. In the following December he defeated General Sterling Price at Blackwater and captured about 1500 prisoners and a large quantity of supplies. He next co-operated with the flotilla of gunboats under Foote in the operations against Island No. 10, which place surrendered in April, 1862, with about 7000 men and 158 cannon. He then took part in the operations against Corinth, after which he was promoted to be major-general of volunteers and brigadier-general in the Regular Army, and was given command of the Army of Virginia, comprising the corps of Generals Fremont, Banks, and McDowell.

He entered upon the new campaign with a somewhat bombastic proclamation, but after some engagements between portions of his army and the forces of General Jackson, and after he had

been reinforced by a large part of the Army of the Potomac, he was badly defeated by Lee and Jackson at the second battle of Bull Run (q.v.). August 29 and 30, 1862, and was forced to retire to the defenses of Washington. He attributed his defeat to the inactivity of the army under McClellan and to the failure of certain officers, particularly of General Fitz-John Porter, to carry out his orders. A court-martial found Porter guilty and dismissed him from the service, but years afterwards the decision was reversed. Pope himself asked to be relieved from command; the request was granted, and he was sent to carry on the war against the Sioux Indians. There has been much dispute as to Pope's responsibility for the disastrous outcome of his campaign against Jackson and Lee, but the weight of opinion has on the whole been unfavorable to him. In January, 1865, after the close of the Indian war, Pope was placed in command of the military Division of the Missouri, which was later enlarged into the Department of the Missouri. In 1867-68 he commanded the Third Military District organized under the Reconstruction Act; in 1868-70, the Department of the Lakes; from 1870 to 1884, the Department of the Missouri; in 1882 was made major-general in the Regular Army; and from 1884 until his retirement in 1886 commanded the Department of the Pacific. He published a report of his explorations for a railroad in vol. ii. of *Reports of Explorations for a Railroad* (1855), and *The Virginia Campaign* (1863). For an excellent account of his campaign against Lee and Jackson, consult Ropes, *The Army Under Pope* (New York, 1881).

POPE, Sir THOMAS (c.1507-59). An English administrator, founder of Trinity College, Oxford. He was born near Banbury, studied at Eton, and entered the employ of Lord Chancellor Audley, who aided much Pope's advancement. Clerk of briefs to the Star Chamber in 1532, he was knighted in 1537 and by 1544 had become a member of the Privy Council. Thanks to his relations with this body, he received many grants of monastic property, and under Mary and Elizabeth regained the favor he lost under Edward VI. In 1555, being one of the richest commoners of England, he founded at Oxford the College of "the Holy and Undivided Trinity."

POPE, WILLIAM BURT (1822-1903). A Methodist theologian, the first to write from the standpoint of modern theological science. He was born at Grand Pré, Nova Scotia; was educated at Richmond College, London; was pastor in England, 1841-67; and in the latter year became professor of theology at Didsbury College, Manchester. He is the author of *Discourses on the Kingdom and Reign of Christ* (1869); *Fernley Lectures on The Person of Christ* (1875; 3d ed. 1899); *Christian Theology* (2d ed., 3 vols., 1877-80); *The Prayers of St. Paul* (1876); *Sermons and Addresses* (1878); and *A Higher Catechism of Theology* (1883).

POPE OF GENEVA, THE. A popular name given to Calvin.

POPERINGHE, pōp'rāng'. A town in the Province of West Flanders, Belgium, six and a half miles from Ypres by rail and four miles from the French frontier (Map: Belgium, A 4). The town is walled and its thirteenth-century parish church is interesting. Its manufactures, which

date from mediæval days, include lace, linens, and woolen cloths. Hops are grown in the district. Population, in 1890, 11,112; in 1900, 11,552.

POPERY LAWS. A term employed to designate certain legislation in England directed against the temporal and ecclesiastical power of the Pope. The first of these statutes seems to have been enacted in the reign of Edward I. In the reign of Richard II, the famous Statute of *Præmunire* (q.v.) was enacted. A number of these old laws still exist on the statute books. Freedom of religion is one of our institutions, and no similar laws exist in the United States. Consult Blackstone, *Commentaries*.

POPEYE. A fish of the North Pacific (*Macrurus cinereus*), one of the grenadiers (q.v.), and so excessively numerous in the depths of Bering Sea that it outnumbers all other fishes there, and furnishes an abundance of food for the marine animals of that region.

POPHAM, pōp'am, GEORGE (1550-1608). An English colonist, born in Somersetshire. As an associate of Sir Ferdinando Gorges in a colonization scheme for a part of Maine, he sailed from Plymouth, England, in 1607, with two ships and 100 men, and landing at the mouth of the Kennebec River, there made the first English settlement in New England, building a storehouse and a fortification which was called Fort Saint George. Popham was elected President of the new colony, but died the following year, and the colonists, becoming disheartened by the severity of the climate, returned in the spring to England.

POPHAM, Sir JOHN (c.1531-1607). An English jurist. He was born at Wellington, Somersetshire, studied at Balliol College, Oxford, and in the Middle Temple, and may have been a member of Parliament in Mary's days. He was certainly recorder of Parliament in 1571, and from 1572 to 1583, and in 1580 was elected Speaker. A year afterwards he became Attorney-General. In 1592, after conducting many State trials as Crown prosecutor, especially those of the Babbington conspiracies, Popham was made Chief Justice and was knighted. A severe judge, he presided at the trial of those implicated in Essex's insurrection, of Sir Walter Raleigh, and of Guy Fawkes. He wrote *Reports and Cases* (1656), a work of small value. He became interested in American colonization, and with Ferdinando Gorges obtained from James I. patents for two companies known respectively as the London Company and the Plymouth Company, the patentees being authorized to make settlements in America and maintain a general government for twenty-one years. Popham sent out an exploring expedition under Martin Pring, and in the following year the short-lived Popham colony, under his brother, George Popham, was established at the mouth of the Kennebec River in what is now the State of Maine.

POPINJAY (OF. *popejaye*, *papegai*, *papegau*, *papegaut*, Fr. *papegai*, *papegaut*, parrot, from ML. *papegallus*, from MGk. *παπαγάλος*, *papagallos*, *παπαγός*, *papagas*, parrot). A name of the green woodpecker (*Picus viridis*), a bird common in most of the wooded districts of England and Scotland. (See WOODPECKER.) The name was originally applied to parrots, but is

no longer in use in that sense. In the Middle Ages and even later the name *popinjay* in England and *papegai* in France was given to a target made to look like a parrot. The effigy was set on a pole and shot at by archers. The most skillful marksman often received a silver popinjay as a prize. Consult Jusserand, *Jeux et sports d'exercice dans l'ancienne France* (Paris, 1901), and Strutt, *Sports and Pastimes* (London, 1801 ff.).

POPISH PLOT. See OATES, TITUS.

POPLAR (OF. *poplier*, *peuplier*, Fr. *peuplier*, from *peuple*, poplar, from Lat. *populus*, poplar), *Populus*. A genus of trees, forming with willows the natural order Salicaceæ. The species number about 20, chiefly natives of the temperate and cold regions of the Northern Hemisphere, half of them occurring in the United States. They are large trees of rapid growth, with soft wood, and usually have broad, heart-shaped, ovate triangular or lozenge-shaped, deciduous leaves, on rather long stalks. Many of them are beautiful. The catkins appear long before the leaves,

breaks and shade in the prairie regions of the West they are also popular. The wood is extensively employed in making wood pulp, paper, etc. Besides the species known by the name aspen (q.v.) or tremulous poplar, the following seem the most worthy of notice: The white poplar or abele (*Populus alba*), a native of Southern Europe, is a tree of 80 feet or upward, with a fine spreading head, and roundish, heart-shaped, lobed, and toothed leaves, which are smooth, shining, and dark green above, downy and silvery white beneath. It has been introduced into the United States and has spread from New Brunswick to Pennsylvania. The wood is used by cabinet-makers, turners, and toy-makers. It is little liable to swell or shrink, which adapts it to these purposes. The gray poplar, which is a form of *Populus alba*, is very similar to the white poplar, a large spreading tree with leaves similar to those of the white poplar, but not so dark green above nor so white beneath. It is of less rapid growth than the white poplar and its wood, which is believed to be harder and better, makes good flooring, and is preferable to pine

POPLAR LEAVES.

1, large-toothed aspen (*Populus grandidentata*); 1a, ament of above; 2, swamp poplar (*Populus heterophylla*); 3, balsam poplar (*Populus balsamifera*); 4, silver-leaf poplar (*Populus alba*); 5, cottonwood (*Populus deltoides*); 6, Lombardy poplar (*Populus nigra*, var. *Italica*); 7, American aspen (*Populus tremuloides*).

and proceed from distinct lateral buds. Few of the poplars are of much value for their timber, which is generally white, soft, and light; but from their rapid growth they are useful as yielding firewood where the scarcity of other fuel renders necessary the planting of trees for this purpose. They are often planted as ornamental trees, since they produce an immediate effect of embellishment in a bare situation more readily than almost any other kind of tree. For wind-

for the neighborhood of fireplaces, being less apt to take fire. It is also used for coarse doors, carts, barrows, etc., and, not being liable to warp, is esteemed by wood-carvers. The tree generally begins to rot in the heart when forty or fifty years old. Like most of the other poplars, it fills the ground with suckers. The black poplar (*Populus nigra*), a native of most parts of Europe, is a tree of 50 to 100 feet high, with an ample spreading head, viscous leaf-buds, and deltoid or

unequally quadrangular, perfectly smooth leaves. It has become introduced and well established in the valleys of the Hudson and Delaware rivers and elsewhere. The wood is used for the same purposes as that of the white and gray poplars. The cotton from the seeds has been used in France and Germany for making cloth hats and paper, but these uses of it were not found profitable. The Lombardy poplar (*Populus nigra*, var. *Italica*, sometimes called *Populus fastigiata* and *Populus dilatata*) is a variety of the black poplar, with erect instead of spreading branches, which appears to have been introduced into Europe from the East, is very common in the Punjab and in Persia, and now also in Lombardy and other parts of Italy. It attains a height of 100 or even 150 feet, and is remarkable for its erect form, contracted head, and very rapid growth. It is sometimes planted as an ornamental tree. Owing to extensive planting during the latter part of the eighteenth century and the early years of the nineteenth, the tree is a very common one in Europe and America. The balsam poplar or tacamahac (*Populus balsamifera*), a common ornamental tree, is a native of both North America and Siberia, has viscid leaf-buds and whitish, ovate-oblong leaves, which in spring are of a delicate yellow tint, and have an agreeable fragrance. The erect fastigiata manner of growth approaches that of the Lombardy poplar. The cottonwood (*Populus deltoides* or *monilifera*), frequently planted for ornament, is the largest of the poplars, specimens 150 feet high and 7 feet in diameter being not uncommon in moist soil along rivers and lakes. It abounds from Quebec to the Northwest Territory, and south to Florida and New Mexico. In Europe it is also known as the black Italian poplar and Canadian poplar. In the Western States the tree is planted for fuel and for its timber, which is considered valuable. *Populus heterophylla*, the swamp poplar, is common from New York to Georgia and west to Arkansas and Texas. It is a tree 80 feet high and has very large cordate leaves. There are a number of other American species, which differ mostly in size of tree and shape of the leaves.

Fossil poplar leaves are known in the Cretaceous rocks of Greenland, and are common in most plant-bearing beds of the Tertiary, differing little from the modern species.

POPLAR BLUFF. A city and the county-seat of Butler County, Mo., 73 miles west by south of Cairo, Illinois; on the Black River, and on the Saint Louis, Iron Mountain and Southern Railroad (Map: Missouri, F 5). It is situated in a district interested chiefly in lumbering and cattle-raising, and carries on a considerable trade in its principal manufactures—lumber and foundry products and brick. The water-works are owned by the municipality. Population, in 1890, 2187; in 1900, 4321.

POPLAR INSECTS. Of several borers which damage the trunks and twigs of both native and Lombardy poplars, *Saperda calceolata* is most prominent. The beetles are found and lay their eggs commonly in August and September. The same species also effects cottonwood in the Western States. The poplar girdler (*Saperda concolor*) frequently girdles the upper branches of large trees, the beetles issuing about the end of May.

One of the largest of the longicorn beetles of the United States (*Prionus laticollis*) lives in the larval state in the trunks and roots of the Lombardy poplar, but also occurs in apple, grapevine, and pine. The poplar goat-moth (*Cossus ceterensis*) lays its eggs commonly upon the bark of the aspen (*Populus tremuloides*) and also upon the bark of balm of Gilead (*Populus balsamifera*). Another common borer in this tree is the Lombardy poplar borer (*Agriilus granulatus*), and still another is the poplar ægeria (*Ægeria tricincta*). A number of caterpillars attack the leaves, including the common tussock-moth caterpillar, the poplar spanworm (larva of *Biston ursaria*),

BROAD-NECKED PRIONUS (*Prionus laticollis*).

the larva of the Antiope butterfly, and the larva of the common butterfly *Limenitis disippus*, as well as the larva of the Io moth and several other moths. The insect fauna of the poplar in the United States comprises more than 100 species, including several geometrid and noctuid larvæ, a number of leaf-miners and leaf-folders, and several species of plant-lice. Consult Packard, *Insects Injurious to Forest Trees* (Department of Agriculture, Washington, 1890).

POPLIN (Fr. *popeline*, *papeline*, from It. *papalina*, poplin, from *papa*, pope; so-called because first made at Avignon, the Papal residence from 1309 to 1376). In the fifteenth century a fabric was woven in Avignon called *papeline*, which was made of silk, and was much esteemed. An attempt to imitate it was made in England, and in 1775 the manufacture was introduced to Ireland by French Protestant refugees, and from that time Irish poplins have been famous. What the exact nature of the original *papelines* was is not certainly known; but the best modern poplins consist of a warp of silk and a filling of worsted, which gives substance, combined with great softness and elasticity, to the material. The filling or weft is made heavier than the warp. This gives the material a corded surface resembling rep. In *double poplin* both the warp and woof are very heavy, making the corded appearance more prominent.

POPOCATEPETL, pò-pò'ká-tá-pèt'l (Aztec, smoking mountain). A volcano situated about 40 miles southeast of the City of Mexico (Map: Mexico, K 8). It rises in the form of a cone to a height of 17,520 feet above sea-level, and is composed chiefly of porphyritic obsidian. Forests girdle its lower parts, and vegetation ceases only near the snow line. About the period of the Spanish conquest it was very active, but no considerable eruption has been recorded since 1548, though minor eruptions occurred as late as 1802, and the crater still emits fumes. Its crater, which has a diameter of about 2700 feet,

POPLARS

1 ASPEN FOREST, ARIZONA (*Populus tremuloides*).

2. LOMBARDY POPLAR (*Populus nigra*, var. *italica*).

contains vast quantities of native sulphur in a very pure state. It is exploited from time to time by mining engineers, the system being unique. Indians are employed who ascend the mountain daily, fill sacks with sulphur in the crater, and then descend by sliding down the precipitous snow side of the volcano. The mountain was first ascended by Diego Ordez in 1522, and since that time the ascent has been accomplished a number of times.

POPOL VUH, pò-pòl' voo' (Quiché, national book). The sacred book of the Quiché (q.v.) of Guatemala. It consists of fragments, more or less complete, of the national traditions and legends, written down in the Quiché dialect, at some unknown early date after the conquest, by a native who was evidently familiar with the ancient records. It is in two parts, the first containing the ancient mythology, the second the early history of the tribe, supplemented by a history of the neighboring and cognate Cakchiquel (q.v.). There is evidence that at least a part of it was originally in rhythmic form. A Spanish translation by Father Ximenez was published in Vienna in 1857, and the original text, with French translation, was issued at Paris by the Abbé Brasseur de Bourbourg in 1861.

POPPEA SABI'NA (?A.D. 66). A wife of the Emperor Nero. She was the daughter of Ollius, a client of Sejanus, but took the name of her mother's father, who was consul in the year 9. She married Rufus Crispinus, praetorian prefect, and after becoming the mistress of Otho (q.v.) was divorced from Crispinus. She then married Otho and soon aroused the desires of Nero, who sent her husband to Lusitania, made her his mistress, put his mother (Agrippina) to death at her instigation, then divorced and killed Octavia for her sake. Poppæa bore him a daughter in 63. The child died at four months. Poppæa was killed by a kick from her husband when she was again pregnant. She was entirely unscrupulous, luxurious and proud, if we are to trust the highly colored narrative of Tacitus. Besides her beauty, her only good point seems to be that she urged on Nero clemency to the Jews, wherefore she won high praise from Josephus.

POPPER, DAVID (1843—). An Austrian violoncellist. Born in Prague, he studied in the Conservatory there, became soloist and conductor in the Vienna Royal Opera, married the pianist Sophie Menter in 1872, and with her toured Europe. In 1876 he was divorced from his wife and settled at Budapest. His playing, which is brilliant and remarkably sympathetic, has placed him in the front rank of modern violoncellists, while his compositions for the cello are in universal use.

PÖPPIG, Pĕ'pik, EDUARD FRIEDRICH (1798-1868). A German traveler and naturalist. He was born at Plauen, and after studying at Leipzig set out for Cuba in 1822. He spent two years there, then for some time traveled in the United States, especially in central Pennsylvania, and in 1826 went through Southern and Central Chili. After two years in the forests of the Province of Maynas, where he lived with the Indians, he returned to Germany (1832), with valuable collections of botanical and zoological material, be-

came professor of zoölogy at Leipzig (1833), and did much for the foundation of the zoölogical museum in that city. He wrote *Reise in Chile, Peru und auf dem Amazonenstrom* (1835), and *Illustrierte Naturgeschichte des Tierreichs* (1851). Consult the biography by Ratzel in the *Mitteilungen* of the Leipzig Geographical Society.

POPPY (AS. *pōpig, papig*, from Lat. *papaver*, poppy), *Papaver*. A genus of the natural order Papaveraceæ, annual and perennial bristly-haired herbs, natives mostly of warm countries. The leaves are alternate and entire or lobed and cut. The poppy has been in cultivation from early times. It was grown by the Swiss lake-dwellers, and a species native to the shores of the Mediterranean was utilized by the Greeks and Romans. By far the most important species is the opium, white, or oil poppy (*Papaver somniferum*), important alike for its yield of opium (q.v.) and for the bland, fixed oil of the seeds, used like olive oil. The seed contains no opium nor any narcotic principle, and was well known to the ancients as a pleasant article of food, but the manufacture of oil was at one time prohibited in France from the mistaken notion that the oil must be narcotic. The seeds yield about 40 per cent. of the oil, and the oil-cake is useful for manure or for feeding cattle. The oil is sometimes used by painters and by soap-boilers, but is not good for burning. In the cultivation of the poppy for oil the seed is often sown in autumn, where the severity of the winter frosts is not to be feared; in more northern parts it is sown in spring, and sometimes the seed is scattered on the snow. Being very small, it needs little or no harrowing. Early sowing is favorable to the size of the plant and the yield. The plants are often cultivated in drills. An open but rich soil is best, and a sheltered situation is necessary, as in exposed situations much of the seed is scattered by the wind. In the United States the poppy is chiefly known as a garden flower.

Under cultivation the flowers of the poppy readily become double, and a large number of ornamental varieties have been derived from various species. As ornamental plants they are popular on account of their large showy flowers, their hardiness and ease of culture. The Oriental poppy (*Papaver orientale*), a native of Armenia, is one of the most important decorative species. Its flowers, which are deep crimson, are larger than those of any other species. The Iceland poppy (*Papaver nudicaule*), a native of Siberia

OPIMUM POPPY.

and the northern parts of America, has orange or yellow flowers and is a widely distributed alpine species. The Oriental and the Iceland poppy are the best perennial species cultivated for ornament. The corn poppy or common red poppy (*Papaver Rhoeas*) is an annual occurring as a weed in European grain fields, especially on calcareous soils. Its bright red flowers make it very conspicuous. A large number of ornamental varieties have been developed from this species. The ornamental poppies grow well in any garden soil, but they produce the best results on sandy loams. The seed is sown in spring in shallow drills where the plants are to bloom, and are later thinned to about one foot apart. For illustration of California poppy, see Plates of CALIFORNIA FLORA and POPPY AND PEPPER TREE.

POPPY FAMILY. An order of plants. See PAPAVERACEÆ.

POPPY-SEED OIL (*Oleum papaveris*). An oil obtained from the seeds of the opium poppy (see POPPY) by pressure. It is used for salads and other purposes, much the same as olive oil, to adulterate which it is often used. The seeds yield about 40 per cent. of oil.

POPULAR SOVEREIGNTY, or SQUATTER SOVEREIGNTY. Terms in American history used interchangeably by many writers and having reference to the right of the inhabitants of a Territory to regulate their internal affairs in their own way without the intervention of Congress. Strictly speaking, the term popular sovereignty was applicable only in the case of an organized Territory, while squatter sovereignty applied only to an unorganized territory inhabited by 'squatters.' The theory of popular sovereignty grew out of the discussions over the question as to whether slavery should be permitted in the territory acquired from Mexico. The first assertion of the doctrine by a man of prominence appeared in the noted Nicholson letter of General Cass, December 24, 1847, in which he expressed the opinion that the people of the Territories should be left "to regulate their internal concerns in their own way." The new doctrine was accepted by the South and was quite generally regarded with favor as being in harmony with the American traditions of local self-government, and furthermore as relieving both Congress and the States from the responsibility of settling a vexatious question. The compromise measures of 1850, in providing for the organization of New Mexico and Utah as Territories without any reference to slavery, would seem to have been the first recognition of the principle, although, on account of the evasive language used, it is difficult to say whether popular sovereignty was a feature of the bill or not. In the later discussions the Southern Democrats claimed that it was not, while Stephen A. Douglas, the great champion of the new theory, asserted that it was. In 1854 the Kansas-Nebraska Bill (q.v.) expressly adopted the principle as the basis for the government of those Territories. Shortly afterwards the South came to repudiate the doctrine of popular sovereignty as dangerous to slavery, and put forward the claim that neither Congress nor the Territorial authorities could legislate against slavery in the Territories, but that it was their constitutional duty to protect the right of property in slaves as recognized by slave States. There is an *obiter dic-*

tum in the famous Dred Scott case (q.v.) which upholds the Southern contention as far as the national Government is concerned. The controversy regarding the question of popular sovereignty, as involved in the Lecompton Constitution (q.v.) for Kansas, brought about a division between the Douglas Democrats of the North and the more radical Southerners, which eventually developed into the split of 1860. With the Civil War and the abolition of slavery the question lost its significance.

POPULATION (ML. *populatio*, from *populare*, to populate, from Lat. *populus*, people; connected with *plenus*, full, and ultimately with Eng. *full*). The number of living human beings. This article will present the leading facts regarding the number of human beings and the number in various classes; reserving for the article VITAL STATISTICS the main facts regarding the increase in the number of human beings. The distinction between population and vital statistics corresponds closely to the distinction between the main sources of information, namely, the census reports and registration reports. In census reports the element of time is either disregarded or reduced to a minimum and an attempt is made to photograph certain aspects of the population as they were on the census day. Registration reports are records of certain defined events within a population group, such as births and deaths, marriages and divorces, immigration and emigration, legal punishments for crimes, the record being made at or soon after the event recorded. Inferences regarding the increase of a population in time may be derived from comparing a series of censuses; but the census cannot give the detailed information about increase or decrease derivable from registration reports.

The population is ascertained by many methods of different degrees of accuracy. Houses are counted and multiplied by the estimated number of persons to a house. The population of school age or the number of names in a city directory is counted and the result multiplied by a number representing the ratio that the class is believed to bear to the total population. But in most cases such methods result in great uncertainty and error, and have gradually been superseded in civilized countries by the slow, expensive, but far more accurate method of a complete count or census. At the present time two-thirds of the population of the earth has been thus counted. The extension of representative institutions has necessarily extended the census as an accurate means of counting population, for under a representative system political power is distributed in some measure according to numbers. It is not surprising, therefore, that the United States, as a great modern country with representative institutions, was the first to count its population by a census.

The population of the earth's surface at the beginning of the twentieth century was probably about 1,500,000,000. About nine-tenths of this population is included within the jurisdiction of eleven of the principal States of the world. The distribution in round numbers is as follows, the figures embracing all colonial possessions and dependencies of every kind (some merely nominal):

POPPY AND PEPPER-TREE

CALIFORNIA POPPY (*Eschscholzia Californica*).

BRANCH OF PEPPER-TREE (*Schinus Molle*).

Austria-Hungary.....	45
Japan.....	44
Netherlands.....	43
Ottoman Empire (with Egypt, Bulgaria, Bosnia, etc.)	40
Italy.....	32

INCREASE. At no time since recorded history began has the increase of population been so rapid as during the nineteenth century, especially the second half of it, when the outflow of people from Western Europe to America, Australia, and South Africa added great numbers to the population of those continents without a corresponding decrease in the countries from which they set forth. (See **EMIGRATION.**) Between 1800 and 1850 the population living within the present area of the German Empire in Europe increased about 43 per cent., and between 1850 and 1900, notwithstanding the great currents of emigration, it increased about 61 per cent. The population on the present territory of Italy increased in the first half of the century about 43 per cent. and in the last half about 35 per cent. The population of Great Britain and Ireland increased in the first half of the century about 70 per cent., and in the last half about 50 per cent. The United States of America increased in population during the first half of the century 340 per cent. and during the second half 228 per cent. But in a case where the initial population is small, percentages are less significant than figures of actual increase. The United States added to its population between 1800 and 1850 nearly 18,000,000 people, and between 1850 and 1900, disregarding the accessions of territory since 1890, it added nearly 52,500,000. At the present time there is no great country except Argentina in which population is increasing at a higher rate than in the United States. Notwithstanding the comparative sparseness of settlement in Canada, Mexico, and Australia, the percentage of increase in those countries is less, and in Europe there is no country in which the rate of growth approaches that of the United States.

URBAN POPULATION. No feature in the rapid increase in the population of civilized countries during the nineteenth century has been more marked than the growth of cities, both in the older European countries and in the newer countries whither that European population has migrated. The results of the last censuses of foreign countries are not yet in every case available, and therefore the following figures speak for 1800 and 1890, or the nearest census years. The countries are arranged in the order of the proportion of urban population in 1890 in the following table.

The following figures illustrate the degree to which the growth of city population during the nineteenth century in nearly all parts of the civilized world outstripped that of population as a whole.

SEX. About half the probable population of the world has been enumerated with relation to sex. From the results it appears that about 50.3 per cent are male and 49.7 per cent. female.

COUNTRY	Per cent. of population living in cities having at least 10,000 inhabitants	
	1800	1890
England and Wales.....	21.3	61.7
Scotland.....	17.0	49.9

Canada.....	17.1
Austria.....	4.4	15.8
Japan.....	13.1
Mexico.....	13.0
Russia.....	3.7	9.3
British India.....	7.3

In Europe alone among the great divisions of the earth's surface do the females outnumber the males, there being on that continent among the enumerated population about 49.4 per cent. males and 50.6 per cent. females. The numerical excess of females in Europe is much greater than the excess of males in the continents to which migration has mainly gone, such as America and Australia, and therefore it follows that in the countries representing Caucasian or white civilization females outnumber the males. But in most other parts of the world for which we have information the reverse is true. Thus in British India 50.9 per cent., in the tributary States 51.7 per cent., and in Japan 50.5 per cent. of the population are male. The excess of males in these countries more than offsets the excess of females in all Europe. It seems likely that in China, which contains the largest body of population, for which we have no information, as in India and Japan, the males outnumber the females. It is even suggested by the foregoing facts that the Occidental civilization of Europe and America, so far as the proportion of the sexes is not disturbed by migration, tends to establish a slight excess of females, while the Oriental civilization of India, China, and Japan tends to the reverse relation. In every case, however, where migration is not an important factor, the departure from numerical equality is slight and relatively insignificant.

AGE. It is usual for a census to report the number of persons of each year of age, or at least the number falling within certain wider age limits. In large population groups the true number of persons living at any year of age is larger than the true number of persons at the next higher year, this being due to the fact that each such group as it advances from infancy to old age is steadily depleted by death. If the group is receiving a large number of immigrants, this would tend to neutralize for certain age groups the wasting away through death, but immigration is seldom, if ever, sufficient in amount to balance the losses from mortality. The births in successive years also vary in number, and thus the initial size of these successive groups differs, but neither this cause alone nor this combined with immigration and other minor disturbing factors makes it likely that the true number of persons in a country at any one year of age is ever smaller than the true number at the next greater

year of age. The reported number very often is greater, this difference between the true and the asserted number being due to inaccuracy in the statements of age made in answer to the inquiries of the census enumerator. These inaccuracies vary with the degree of education and the economic position of the class reporting. Where they exist in large numbers they are indicated by a disproportionate number of individuals reported with ages at multiples of 5, and especially of 10. Internal evidence of the relative accuracy with which ages are reported, and perhaps indirectly of the relative accuracy with which other census questions are answered, may be found by measuring this concentration of reported ages on multiples of 5 and 10. The true number of persons in a community aged 30, 35, 40, 45, 50, 55, and 60 is probably about one-fifth of the total number whose age is reported as between 28 and 62, inclusive. The per cent. by which the reported number of these seven ages exceeds the estimated number affords a measure of the irregularity of the age distribution and so of the probable error in the returns. Measured by this test there were 1,670,000 persons in the United States in 1890 and 1,250,000 in 1900 between 28 and 62 years of age, whose ages were reported erroneously as a multiple of 5. The reported number in 1890 was 38 per cent. and in 1900 23 per cent. in excess of the estimated true number.

Perhaps the best single figure indicating the age composition of a population group is the median age, or an age such that half the members of the group are above and half are below it. For the white population of the United States this median age increased almost steadily during the nineteenth century from 16.0 in 1800 to 23.4 in 1900, the increase being due in part to the increased longevity of the adult population and in part to the steadily decreasing proportion of children. The median age of the population in the South (South Atlantic and South Central divisions) was 19.5 years in 1900, that of the population in the North (North Atlantic and North Central divisions) was 24.5, a difference of 5 years.

The proportion of the population falling within various age classes is of importance for itself and as indicating reasons for other statistical differences between population groups. Thus in Indian Territory 15.3, in South Carolina 15.2, and in Utah 15.1 per cent. of the population are under 5, these being the regions of the United States in which the proportion of children is greatest. At the other extreme there are the District of Columbia, with 8.3 per cent., California, with 8.5, and Nevada, with 8.9. The greatest proportion of elderly persons is found in the northern New England States, Vermont having 8.1, New Hampshire 7.9, and Maine 7.9 per cent. of the population over 65 years of age.

MARITAL CONDITION. The relation of the population to the social institution of marriage is measured by numbering the classes of the single, the married, the widowed, and the divorced. This relation depends largely upon the age composition of the population group. The great majority of those who live to adult years marry, and half of those who marry are widowed, a small additional number being divorced. The age at which marriage is entered differs greatly according to the character of the civilization. Thus in countries

dominated by Caucasian standards it is usual to assume that marriage does not take place below the age of 15. In India, on the contrary, in 1891 6 per cent. of the boys and 17 per cent. of the girls under 15 years of age were married. In uncivilized and semi-civilized countries marriage of adults is practically universal. Celibacy is regarded as unnatural and almost prohibited by social opinion. A Chinese authority writing for European readers says: "In Europe every one old enough to enter the army receives a military training; in China every one old enough to marry, marries." So in India of the women over 50 less than one per cent., and of the men about three per cent. are still single. In Europe and America among persons who have lived through the reproductive period of life the proportion of the single is from 10 to 20 per cent. for women, except in Hungary and the United States, and from 7 to 14 per cent. for men. In the United States the proportion of the population who are married has been ascertained for 1890 and 1900, with results that differ but little from the above. When the figures are analyzed by age it appears that among the young of both sexes there was a slight increase in the proportion of married persons, and at higher ages a slight decrease in the proportion of married, the two about offsetting each other. This change is contrary to the general trend in most countries and in one or two American States for which figures covering a longer period are available. It is probably the result of very prosperous conditions in the two or three years immediately preceding 1900, marriage figures constituting a sensitive measure of prosperity.

RELIGION. Civilized countries differ in regard to making inquiries into the religious affiliation of the population. In Italy, France, Great Britain, and the United States it is thought unwise to ask this question through the census. Accordingly, the population, or the enumerated population, of the earth cannot be distributed with accuracy according to religious confession. According to a careful attempt made to secure approximate results in this field, the figures in round numbers are as follows:

RELIGION	Estimated number of adherents in millions
Christianity.....	480
Confucianism.....	250
Hinduism.....	200
Mohammedanism.....	175
Buddhism.....	150
Taoism.....	40
Shintoisim.....	15
Judaism.....	10
Polytheism.....	- 120
Total.....	1,440

The adherents of Christianity are subdivided as follows:

RELIGION	Estimated number of adherents in millions
Catholicism.....	230
Protestantism.....	145
Greek Church.....	100
Minor divisions.....	5
Total.....	480

LANGUAGE. There are no trustworthy statistics for the population of the earth as a whole or even the civilized countries, indicating the number of persons using the main languages as their ordinary means of communication. There

PORCELAIN - I.

- 1 CHINESE VASE PAINTED IN COBALT
- 2 CHINESE SOUP-PLATE OF EGGSHELL-PORCELAIN 18TH CENTURY
- 3 LARGE CHINESE VASE ON PORCELAIN PIED-ESTAL DATE ABOUT 1600
- 4 CHINESE WINE-JAR OF THICK PORCELAIN
- 5 JAPANESE HIZEN-JAR 18TH CENTURY
- 6 MODERN JAPANESE CUP 19TH CENTURY
- 7 CHINESE ENAMELED PORCELAIN JAR MING-DYNASTY

is no doubt that the number of languages spoken on the earth has rapidly decreased and is rapidly decreasing. There is no doubt that the number of persons speaking the main Aryan languages is rapidly increasing, both by the natural increase of the Caucasian population and by the extended use of these languages, with the extension of the trade and commerce of these countries. But there is no satisfactory statistical measure of this increase.

ILLITERACY. It is common, although not universal, to inquire at a census whether the person is able to read and write. With the extension of education in most civilized countries the proportion of illiterates among the population is declining. At the present time this proportion, in Christian countries, is greatest in the Slavic peoples and among the negroes of the United States. An intermediate position is held by the Romance countries and Hungary, while the highest position is occupied by England, the United States, and the Germanic countries of Europe.

See **VITAL STATISTICS; IMMIGRATION; EMIGRATION.**

POPULIST PARTY, or PEOPLE'S PARTY. A political party in the United States, organized at Cincinnati in May, 1891, by a national convention composed chiefly of representatives of the agricultural and industrial classes. The party grew out of the movements previously inaugurated by the "Grangers" and the "Farmers' Alliance" (q.v.). Its platform of principles demanded the free and unlimited coinage of silver; the abolition of the national banking system; the issue of fiat money in sufficient quantity to transact the business of the country on a cash basis, and the loan of such currency to the people at not more than two per cent. per annum on non-perishable agricultural products; national ownership of all means of public communication and transportation; a graduated income tax; popular election of United States Senators; the adoption of the initiative and referendum in legislation; and the prohibition of alien ownership of land. On July 2, 1892, a National Convention of the Populist Party met at Omaha, Neb., for the purpose of nominating candidates for President and Vice-President of the United States. It adopted a platform embodying the above mentioned views and nominated James B. Weaver of Iowa for President and James G. Field of Virginia for Vice-President. The Populist ticket received 22 electoral votes and a popular vote of 1,055,424. In the next Presidential campaign, that of 1896, the Populist Party nominated for President W. J. Bryan, who had already received the nomination of the Democratic Party, and for Vice-President Thomas E. Watson of Georgia. Most of the Populist Party supported Bryan and the Democratic candidate for Vice-President, W. J. Sewall, but a considerable portion of the party stood for the independence of their movement, and voted for Bryan and Watson. On account of their refusal to depart from the path marked out by themselves, the latter were called the "Middle-of-the-Road" Populists. In order to have the full Populist vote counted for Bryan, an arrangement was made between the two parties in twenty-eight States, by which each was to have a proportionate representation on the electoral ticket. As a

result of this arrangement Bryan received 176 electoral votes, while Sewall received 149 and Watson 17. The Populist platform of 1896 differed but slightly from that of 1892. In the campaign of 1900 the Populist Party again nominated for President W. J. Bryan, who was also the Democratic nominee, but again refused to indorse the Democratic nominee for the Vice-Presidency (Adlai E. Stevenson of Illinois). After a spirited contest, Charles A. Towne of Minnesota received the nomination for Vice-President, but he subsequently withdrew, and the National Executive Committee of the Populist Party substituted Stevenson. In addition to its old principles the party in 1900 denounced the imperialistic policy of the Government, expressed sympathy for the Boers in their struggle with Great Britain, advocated municipal ownership of public utilities, and condemned the practice of the courts in issuing injunctions in labor disputes between employers and employees. Consult: Hopkins, *Political Parties in the United States* (New York, 1900); McKee, *National Conventions and Platforms* (Baltimore, 1900); and Reynolds, *National Platforms and Political History* (Chicago, 1898).

POP'ULONIA. An ancient town of Italy. See **PIOMBINO.**

PROBEAGLE (from Fr. *porc*, hog + Eng. *beagle*), or **MACKEREL SHARK.** Specifically, a ferocious shark (*Lamna cornubica*), bluish gray in color and reaching a length of ten feet, which is found in both the North Atlantic and North Pacific. The term is extended, however, to include

TEETH OF A PORBEAGLE (SIDE VIEW).

the whole of its family (Lamnidae), which contains several pelagic species, often of great size, power, and ferocity, with stout bodies, a wide mouth with separate, triangular, highly specialized teeth (the third in the upper jaw always small), large gill-openings, and great fleshy fins. In addition to the typical porbeagle (a British name), a well-known species (*Isurus oxyrinchus*) haunts the Mediterranean, where it is called 'cane de mare;' and a rarer one (*Isurus DeKayi*) occurs on the North American coast. The largest and most cosmopolitan of the family is the great white 'man-eater' shark (q.v.).

PORCELAIN (OF. *porcelaine*, *porcellaine*, Fr. *porcelaine*, from It. *porcellana*, porcelain, Venus-shell, so called because the highly polished surface suggested that of the Venus-shell, whose curved upper surface resembled a pig's back, from *porcella*, diminutive of *porco*, pig, from Lat. *porcus*, swine, hog, pig; connected with Lith. *parszas*, Ir. *orc*, OHG. *farh*, dialectic Ger. *Farch*, Ger. *Ferkel*, AS. *fearh*, Eng. *farrow*, pig). A peculiar kind of pottery made by the Chinese for many centuries, and in Europe since the discovery of its ingredients about the year 1710. There was indeed a little porcelain made in Florence at the close of the sixteenth century, but it is probable that this was made of materials brought

from China. Its decoration shows the artistic spirit of the time; but so very little of the ware was made that it never influenced the later development of the manufacture in Europe. The next attempt at making the ware in Europe was by experiments, each separate establishment producing a fine white ware made of some mixture of ingredients peculiar to the establishment in question and often kept secret. These wares resulted in the manufacture of what is known as soft porcelain, false porcelain, artificial porcelain, and by similar names. In these the copying of the Chinese ware was avowed and some of the announcements were to the effect that at length the true Oriental secret had been discovered. The ware was, however, more nearly a glass than a true ceramic ware.

The date of the first manufacture of porcelain in China is not fixed. The earliest piece that can be dated dates from the Sung dynasty between 960 and 1368; but all Chinese history and tradition point to a much earlier date even than 960 for the first making of a real porcelain.

Vitreous glazes of the surface and the partial vitrification of the whole mass as described below need not of necessity have characterized the very early wares which are now assumed to have been porcelaneous. The characteristic of Chinese porcelain which has always caused the greatest admiration and the most minute study in Europe, the decoration by means of under-glaze and over-glaze painting, seems not to have been introduced until a time late in the Ming dynasty. Before the fifteenth century decoration was carried out very largely in relief or in intaglio this relief varying from minute patterns raised by modeling upon the surface while soft to boldly projecting figures, masks, flowers, and the like, molded separately and applied, the adhesive paste causing them to keep their positions until fired. The patterns in intaglio are sometimes very elaborate, and use is made of the color of the glaze filling up these recessed lines and scrolls more deeply than it covers the body of the piece, so that these incised or impressed patterns show in a different color from the rest of the surface. These methods of decoration are not limited to the period in question, but have been kept constantly in use. During these earlier years (Sung dynasty and the first reigns of the Ming dynasty) decoration by 'solid color' as it is now called, was greatly respected; the forms of vases and platters were as graceful or as vigorous and significant as at any subsequent time, and vessels of these refined shapes were invested with color, especially a splendid green which has been hard to procure in later wares—the green which is the true and proper tint, afterwards described in France as *céladon*. Other colors existed, especially yellow, which has always been the Imperial color, though opinions differ as to the proper hue; but, as has been stated by the latest and most accurate European writers, the years before 1367 may be said without impropriety to constitute the *céladon* period. Of course these dates and attributions are still open to revision.

The reign of the Emperor Wang-Li, which is generally given as from 1573 to 1619 A. M., is accepted as the period of the earliest pieces painted in brilliant colors and existing in Europe in any considerable number. In these the painting is

of two kinds: in pure blue on the unbaked body before the glaze has been applied, and in enameled colors applied to the finished and fired piece upon the glaze and fixed by a second firing at a relatively low temperature. Such pieces are of extreme softness and delicacy; the blue shows through the glaze in an elaborate scheme of outline, much as the etched line in a *Liber Studiorum* (q.v.) print shows through the mezzotint which was applied afterwards. The more brilliant colors, usually green, yellow, and red, though black is also used in certain pieces, are applied upon and within these outlined spaces and the slight irregularities and imperfections, where the outline is at one moment partly obscured by the enamel color and again left more clearly separated from it, add greatly to the charm of the piece. The fault often found with the richly decorated Chinese porcelain, namely, that the patterns are hard and too strongly relieved from the nearly white ground, is hardly true of these pieces, which are among the most attractive known. This peculiar system has not been abandoned, but even during the eighteenth century it was followed with great success, and it is possible that some of the pieces so painted are of the nineteenth century. Pieces in pure blue and white are, however, the especial production of the Ming epoch. Nearly all the important blue-and-white pieces which bring enormous prices in Europe, and especially in England, where 'blue china' was the particular fad of the years between 1870 and 1890, are assumed to be of the Ming dynasty, although it is quite well understood by more careful students that but few of such early pieces exist in Europe, and that those few are generally so placed and so held that they can never come into the market. Such are not merely the pieces in national collections, but also some in private hands and identified during many years by their having been mounted in European silver or silver-gilt, with feet, covers, tips to spouts, and the like, the plate marks on the silver fixing the date of this work beyond any question.

Nine-tenths of the beautiful wares existing in Europe, brought thence to the United States, are of the Ching or Tsing dynasty, that is to say, the dynasty of the Tatar conquerors of China, beginning with 1644, and still holding the throne. The Tsing pieces are of all sorts: pure white with or without delicate incised patterns, or in grotesque forms of dragon and the like, or in carefully modeled and delicately formed statuettes; white painted with pure blue under the glaze; white covered externally with pure strong color, blood-red (*sang de bœuf*) or maroon, turquoise blue or deep blue, yellow, and other hues; pieces of which the pattern is 'reserved' in white on a ground filled in with dark blue or black, or, pieces of which the pattern is 'reserved' in white pieces adorned with very elaborate painting in many colors, the subject being often flowers, flowering plants, bushes, bamboo thickets, and the like, and as often including human figures treated with great dexterity and a very sufficient knowledge of drawing, but made decorative rather than realistic.

The history of real porcelain in Europe is very brief; for the Florentine ware above named has no connection with the development of the art. That development began in Saxony, at the Meissen factory near Dresden, under the direction of

Johann Friedrich Böttger. In 1756 the Sèvres factory was established by royal decree as a continuation and development of the earlier factory at Vincennes, and in 1768, the actual porcelain clay having been discovered a few years earlier, the hard porcelain was manufactured at Sèvres. The establishment has maintained its graceful work without intermission, even during the Revolution, and the style of decoration has changed as the different directors have sought for new systems of design. The productions of the manufactories can always be purchased, except when made especially for national gifts to friendly powers or public benefactors, but the prices are high and no promise can be made as to the time of delivery. At present, since 1898, the old systems of design have been largely abandoned and a very elaborate development of independent thought in the decoration is in progress. Among the most remarkable of its movements are the unglazed pieces known commonly as biscuit figures, which are found modeled by the first sculptors of France. These are sometimes sixteen or twenty inches high, and groups or series of them are prepared for the adornment of the table at a stately banquet or for similar uses. There are two different hard porcelains made: one which approaches very nearly in quality and color, and in the degree of heat needed to fire it, to Chinese porcelain; the other a still harder ware fired at a very high temperature and of course limited in its coloration, as few pigments are available. In England, in the eighteenth century, the true porcelain was made in at least two towns, Plymouth and Bristol, and many other manufactories were started in the first half of the nineteenth century. It is since 1850, however, that English porcelain has become an important industrial product. There is no national establishment, and therefore the wares made are all for the market and artistic advance is not steady.

PROCESSES OF MANUFACTURE. Porcelain is made by firing together two natural materials which are known by Chinese names, kaolin and petuntze, although the deposits found in Europe are not commonly of exactly the same chemical nature as the Chinese. The latest careful writer on the subject, William Burton, says expressly that the kaolin has been produced by the gradual decomposition of the petuntze; and it is admitted that the two natural substances, the harder and more rock-like petuntze and the clay-like kaolin, are of the same general composition. The body is generally made of the kaolin just as any piece of pottery is modeled in common clay, and the fusible petuntze forms the glaze, but with this peculiarity in the process, that body and glaze are fired together. This is exceptional in the ceramic art, because in most varieties of pottery the glaze is applied separately and fired separately and at a much lower temperature. The temperature needed for the firing of true porcelain is about 1400° Centigrade, or more than 3000° Fahrenheit. The few pigments that will bear this great heat are applied on the body and under the glaze. Paintings in vivid colors are nearly always of the nature of enamel applied upon the glaze and showing plainly as in slight relief, or else as having a surface altogether different from that of the glaze, and usually much less brilliant.

BIBLIOGRAPHY. Treatises on porcelain are

usually to be found in the books devoted to ceramic ware in general. (See the bibliography of POTTERY.) A few have been devoted to this special ware, and the most celebrated of these is the work of Jacquemart and Le Blant, *Histoire artistique, industrielle et commerciale de la porcelaine* (Paris, 1862). This work has been in part superseded by more recent treatises, but is famed for the admirable illustrations from etched plates by Jules Jacquemart. Chinese porcelain has been treated in two French books, *La céramique chinoise*, by Grandidier (Paris, 1894), and *La porcelaine de Chine*, by O. Du Sartel (ib., 1881); these works are large quartos with many plates. The work devoted to the Walther collection in Baltimore, whose chief author is Doctor Steven W. Bushell, contains a more profound study of the subject than any other work, and its illustrations are admirable chromolithographs. The same distinguished expert has aided in the publication of *A History and Description of Chinese Porcelain*, by Cosmo Monkhouse (New York, n.d., about 1901). The publications connected with the Sèvres manufactory are important, especially *La manufacture nationale de Sèvres, exposition universelle de 1900*, having a carefully prepared text, and a number of excellent plates illustrating the most recent productions. *A History and Description of English Porcelain*, by William Burton (New York, n.d., preface dated 1902), is a really critical treatise, as is also the popular treatise by Lehnert, *Das Porzellan* (Bielefeld, 1902).

PORCELAIN TOWER. An octagonal structure in Nanking, China, erected in the early part of the fifteenth century. It had nine stories, faced with variegated porcelain, from which bells and lamps were hung. The tower was destroyed by the Taipings in 1853. Many miniature reproductions are in existence, among them those in the Green Vault in Dresden.

PORCELANITE, or PORCELAIN-JASPER. A metamorphic rock of the granite group which is formed by the baking of argillaceous beds. It has the fracture of flint, and is gray to red in color, somewhat resembling jasper, from which it differs, however, in being more fusible.

PORCH (OF., Fr. *porche*, from Lat. *porticus*, porch, gallery, from *porta*, gate). An open lobby, vestibule, or room, affording entrance to a building, and usually built as an accessory to the main mass and projecting from it. The porch of a church may be a gabled building, small and low in comparison with the church proper, with a single door of entrance and a single passage-like interior with permanent seats along the sides; or it may be a mere roof, vaulted or of wooden frame-work, resting upon a pair of columns, as often in the churches of Lombardy; or it may be as long as the whole church is wide, as in the narthex of Eastern churches, or the great vestibule of Saint Peter's at Rome. Such great porches as these will naturally be more or less closely united to the main structure, as they are high and as it is common to build a series of rooms or a gallery above them; they are, therefore, more properly vestibules than porches, though the latter term is more generally applied to them.

The projecting porches of Gothic churches add much to their variety of outline and often receive

the richest ornamentation. (See PORTAL.) Thus the cathedral porches of the thirteenth century, especially in France, are made to shelter great numbers of statues of life-size, and larger, and a still greater crowd of small figures under niches; and in addition to this, much floral sculpture. In England there still remain many wooden porches of the fourteenth and fifteenth centuries, and one or two exist on the Continent. Finally, it must be mentioned that the lower story of a tower is often made to serve as a porch, having, perhaps, three doorways in its three free sides, and in the fourth side a doorway into the church. The most elaborate porch of this character is connected with the Church of Saint-Benoit-sur-Loire (Loiret), France.

In domestic buildings, especially in lands where there is much hot sun, it is common to have verandas, and these are porches if the access to the doorways of entrance is by means of them.

The propylea of a Greek palace or temple inclosure is to be considered a porch, although the person entering does not reach the main building immediately. See PROPYLEA.

PORCIA GENS (Lat., Porcian family). A plebeian gens of Rome, appearing first in the third century B.C. Its most famous family bore the name of Cato.

PORCUPINE (OF. *porc espin*, It. *porco spino*, from ML. *porcus spinosus*, porcupine, spine-hog, from Lat. *porcus*, swine, hog, pig, and *spina*, spine, thorn). A large forest-dwelling rodent of the family Hystricidae, characterized prominently by an armature of horny spines ('porcupine quills') intermixed with coarse hairs. The family includes two well defined sub-families, the Old World porcupines, Hystricinae, which are terrestrial and fossorial, and the New World porcupines, Sphingurinae, which are boreal and not

LOWER TEETH OF A PORCUPINE.

Showing the method of growth of the great incisor, reaching back beyond the roots of the molars; the hinder end is cut away to expose the pulp and pulp cavity.

fossorial. Other differences also occur in the skeletons. Of the Hystricinae, the best known species is the common porcupine (*Hystrix cristata*) of the Mediterranean region. It is one of the largest of rodents, being from two to three feet in length, besides the tail, which is about six inches long. The occiput and neck are furnished with a crest of long, erectile bristles. The muzzle and limbs are covered with very short hair; the back and sides with spines, which on the middle of the back are almost of the thickness of a goose-quill, and more than a foot long. The spines are supported by a slender pedicle, terminate in a sharp point, and are ringed with black and white, which gives a general gray color to the animal. Their ordinary position is flat, with the points directed backward; but when the animal is excited they are erected, giving the beast the bristling appearance shown in the ac-

companying plate. It can roll itself up like a hedgehog, with spines pointing in every direction. The spines or quills at the tip of the tail are of very singular structure, being open thin-sided tubes, about two inches long, supported upon slender flexible pedicles, and they make a sound by rattling together when the tail is shaken. The animal is solitary and nocturnal, burrows in the ground, and in winter becomes torpid. It feeds on roots, bark, fruits, and other vegetable substances, sometimes committing depredations in gardens. The spines or quills of this, as well as of other porcupines, are used for various purposes, and have a certain commercial value. A larger species of porcupine (*Hystrix leucurus*), with the quills of the tail quite white, is found in India, and other species inhabit different parts of Asia and Africa. The Malayan and West African brush-tailed porcupines of the genus *Atherura* differ from the true porcupines in having the quills flattened like blades of grass, and those of the tail gathered into a tuft at the end of it.

Of the other sub-family, the Sphingurinae, the best known species is the North American porcupine (*Erethizon dorsatus*) of the forested parts of Canada and the Northeastern United States. It is about 2½ feet long, the tail adding about six inches more. The spines are only two or three inches long, yellowish-white, mingled with black hair, giving the animal a black and white color. The spines are largest along the sides of the broad, flat tail. The Canada porcupine is often seen on the ground, where it makes a home among the rocks, or in a hollow stump, but spends most of its time in trees, especially evergreens. It is harmless and inoffensive, but is able to resist attack well, not only by its armature of quills, but by powerful strokes of its tail, and feeds on bark, buds, leaves, fruit, etc. The flesh of the young ones is very good. A closely allied species, the yellow porcupine, is found in the West. The other species of this sub-family are small strictly arboreal species, with more or less prehensile tail, found in Mexico and South America. They are called 'tree porcupines' and belong to the genera *Sphingurus*, which has short spines, and *Chaetomys*, in which the body is clad with stout, wavy bristles. Consult general natural histories; especially, for the Canada porcupine, Stone and Cram, *American Animals* (New York, 1902); Merriam, *Mammals of the Adirondacks* (ib., 1893); Ingersoll, *Wild Neighbors* (ib., 1898).

PORCUPINE-FISH. One of a family, Diodontidae, of the order Plectognathi, allied to the globe-fishes, Tetraodontidae, from which they differ chiefly in the stronger armature of the skin, and in having no division in the bony plate of either jaw. They are short and broad in form, and are covered everywhere with spines, each rooted upon a bony base, and in some species with strong, hair-like bristles. Each jaw is covered with a bony plate, like a beak of a bird, and the nostrils form small tentacles. They are sluggish fishes, inhabiting warm seas of various parts of the world and living on the bottom among weeds and corals. When disturbed they swallow air, and float belly upward on the water, but their capacity of inflation is much less than that of the globe-fishes. They are generally regarded as poisonous, and therefore rarely used as food, but they are often utilized as curiosities. The best known species is *Diodon hystrix*, common every-

where in the tropics, and often taken in Florida, where its Spanish name is 'erizo.' (See Plate of PLECTOGNATH FISHES.) It reaches a length of about three feet. Another smaller and darker species of these fish is *Diodon holacanthus*, also well known. An allied species, *Chylomyeterus Schoepfi*, only six to ten inches long, and very abundant in the bays and lagoons from Virginia to Florida, swells up when touched after the manner of the Northern puffers. It is greenish in color, with the abdomen paler, the back and sides marked by round black spots and parallel black stripes. Its common names are 'burr-fish,' 'rabbit-fish,' and 'swelled toad.' Several other species of the same genus exist in the tropics.

PORCUPINE WOOD. The wood of a palm. See COCOANUT.

POR/DAGE, JOHN (1607-81). An English mystic. He was born in London, and was a minister in the Church of England from 1644 to his death. During the Commonwealth his advocacy of the views of Jacob Boehme led to his suspension (1655), but he was reinstated at the Restoration. In 1663 he joined Jane Lead (q.v.), and with her established the short-lived Philadelphia Society, which was intended to unite the followers of Boehme and win the world for peace. A number of his works were published posthumously, and several were translated into German or Latin.

PORDENONE, pór'dá-nó'ná. A town in the Province of Udine, Italy, on the Noncello, 29 miles southwest of Udine (Map: Italy, G 2). Ruins of its old walls and of an ancient castle still remain. There are manufactures of cotton, linen, and silk fabrics, paper, and earthenware, and a trade in wine and grain. The site is supposed to be that of the *Portus Naonis* of the Romans. Population (commune), in 1901, 12,482.

PORDENONE, GIOVANNI ANTONIO DA (1483-1539). A Venetian painter of the High Renaissance. He is sometimes wrongly called Licinio. His family name was Sacchi, and he usually called himself Pordenone, after his native town in Friuli. He studied at Udine, and was engaged in painting in the churches of Friuli as early as 1504. Although he lived mostly in Pordenone, he received many commissions in other cities, and at Venice he learned to imitate Giorgione, the leading influence which governed his style after 1513. In 1520 he assisted in the decorations of the cathedral at Cremona, and in 1528 was employed by the Council at Venice to paint a large picture for the great hall—a commission at first assigned to Titian, who had long delayed the work. He settled definitely at Venice in 1535, having been previously knighted by the King of Hungary, and assumed the name of Regillo. At the invitation of the Duke, Pordenone, in 1538, went to Ferrara, where he died suddenly in January, 1539. His most important work are frescoes, although he executed many altar-pieces. Most of his paintings have suffered much from age and restoration, but the altar-piece in Sant' Elemosinario, Venice, still retains some of its richness and beautiful coloring. The chief work of his youth is the frescoes in the Church of San Salvatore in Castel Cotalto, and the finest are those in the Malchiotro Chapel of the cathedral at Treviso, dated 1520. His best oil paintings are the "Glory of Saint Lorenze Giustiniani," and a "Madonna," in the

Venice Academy. Although not ranking with the greatest Venetian masters, Pordenone was the only decorative painter of the school, and the most dramatic of its masters.

PORE. See SKIN.

POREL, pór'rél', MADAME. A French actress. See RÉJANE, MADAME.

PORFIRIO DIAZ, pór-fér'é-ó dé'ás, CIUDAD. A town of Mexico. See CIUDAD PORFIRIO DIAZ.

PORGY or **PORGE** (corrupted from American Indian *mischcuppaug*, or from Lat. *pagrus*, *pager*, from Gk. *πάγρος*, *pagros*, sea-bream). Any of several fishes of the family Sparidæ. They are carnivorous shore-fishes of the tropical seas, abundant in American and European waters, and excellent food fishes. The common American porgy (*Stenotomus chrysops*) is more commonly known as 'seup' (q.v.) along the Atlantic coast of the United States, and several allied species occur about Florida and the West Indies, and are marketed locally. The European 'red-porgy' (*Pagrus pagrus*), known in the Mediterranean as 'besugo' and 'pargo colorado,' attains a length of about two feet, and is common on the European coasts, and also in the Gulf of Mexico and southward, where it is highly valued. On the Pacific

CALIFORNIAN PORGY (*Damalichthys argyrosomus*).

Coast the name is given to one of the Californian surf-fishes (q.v.), otherwise known as 'white perch' (*Damalichthys argyrosomus*). Consult Kingsley, *Standard Natural History*, vol. iii. (Boston, 1885).

PORIFERA (Neo-Lat. nom. pl., from Lat. *porus*. Gk. *πόρος*, pore, passage + Lat. *ferre*, to bear). The second or next to the lowest phylum of animals—the sponges; also its single constituent class. See SPONGE.

PORISM (from *πόρισμα*, *porisma*, corollary, from *πορίζειν*, *poriscin*, to bring about, deduce, from *πόρος*, *poros*, passage; connected with Lat. *peritus*, skilled, OChurch Slav. *periti*, to fly, Skt. *par*, to cross over, Goth., OHG., AS. *faran*, Ger. *fahren*, Eng. *farce*). A kind of geometric proposition common in Greek mathematics. The word seems to have been loosely employed, Proclus (q.v.) telling us that it is used in geometry to designate either a corollary or a proposition which partakes of the nature of both a theorem and a problem. The most ancient tradition divides propositions into *theorems*, *problems*, and *porisms*, according as it is required to demonstrate, to do, or to find. Thus, "To construct an equilateral triangle on a given line" is a problem; "To find the centre of a given circle" is a porism. The term porism was also used by Diofantus with reference to certain propositions in arithmetic. Consult: Chasles, *Les trois livres de porismes d'Euclide* (Paris, 1860); Chasles,

Aperçu historique (3d ed., Paris, 1889); Gow, *History of Greek Mathematics* (Cambridge, 1884).

PORK (OF., Fr. *porc*, from Lat. *porcus*, swine, hog, pig). The flesh of swine. This meat is widely used and extensively exported for food and is valued for its heat-giving qualities and for the ease with which it may be preserved by salting, drying, or smoking. The pork-packing industry has grown to enormous proportions in the United States. In 1900, the bacon exported was valued at \$39,000,000; the hams, \$20,000,000; lard, \$42,000,000; and the total hog products, over \$112,000,000. The flavor of pork is affected more or less by the feed given to the pig, as is also the character of the fat. Fat with a low melting point is characteristic of 'soft' pork, while a higher melting point is found in that of better quality. Acorns are believed to cause the peculiar and delicate flavor noticed in the flesh of pigs which are allowed to run where they have access to them. The over-fat carcass is now quite generally recognized as undesirable, and smaller pigs with fat and lean well distributed are more satisfactory. Pork contains on an average more fat than other meats, but does not differ from them markedly in other respects as regards composition. It is often said that pork is unwholesome, but this seems to be wholly a matter of opinion, as so far as scientific food experiments go there is nothing to show that good pork is less desirable for men in health than other meats. It is very likely that much of the prejudice against pork comes from the fact that it is one of the foods avoided by the Jews and Mohammedans on account of their respective religious beliefs. See PACKING INDUSTRY; MEAT; FOOD.

POROMUSHIR, pō'rō-mōō-shēr'. One of the Kurile group of islands. See KURILE ISLANDS.

POROSITY (from Lat. *porosus*, full of pores, from *porus*, pore, passage). A term expressing the experimental fact that no kind of matter completely fills the space it occupies; in other words, that all bodies are full of minute cavities or interstices, such as are illustrated on a large scale by a sponge.

PORPHYRIO, POMPONIUS. A Latin grammarian, presumably of the third century A.D. His commentary on Horace is the most valuable which has come down to us, though sometimes fanciful and frequently marred by interpolations of mediæval clerks. It is edited by Meyer (1874) and by Holder (1894).

PORPHYRION (Lat., from Gk. Πορφυριων). In Greek mythology, a giant destroyed in the combat with the gods because at the sight of Juno's beauty he forgot to defend himself.

PORPHYRITIC TEXTURE. See IGNEOUS ROCKS.

PORPHYRIUS (Lat., from Gk. Πορφύριος), (233-c.304 A.D.). One of the most important of the Neo-Platonists and the chief disciple of Plotinus. He was born at Batanea, in Syria, where he received his early education. His original name was Malchus, but this was changed, according to tradition, to Porphyrius ('wearer of the purple') by Longinus, whose disciple he was at Athens from 252 to 262. In the latter year he went to Rome and soon attached himself to Plotinus. After some years he moved to Sicily, but returned to Rome under Aurelian and con-

tinued his teaching into the reign of Diocletian. Porphyrius was not a deep thinker. He devoted himself to grammar and history as well as philosophy, but his great service was as an expositor and definer of Plotinus's obscure doctrines, which Eunapius declares he made clear to the common understanding. He was a very prolific writer. Suidas has preserved to us an incomplete list of his writings, some of which deal with speculative philosophy, but the larger number were devoted to the history of philosophy and its exposition. The most important of these are his *Life of Pythagoras*, his work *On Abstinence from Animal Food*, an *Introduction and Commentary to Aristotle's Categories*, and a work addressed to his wife, Marcella. Of his lost works the most important was one directed against the Christians, which was publicly burned at the order of Theodosius II. That he was originally a Christian, as is stated by Socrates, the Church historian, and by Saint Augustine, there is not the slightest proof. A complete edition of his works and fragments has never yet been published. The most important editions of single works are the following: *Porphyrii Opuscula Selecta*, by Nauck (2d ed., Leipzig, 1886); *The Life of Pythagoras*, together with Iamblichus's similar work, by Kiessling (Leipzig, 1816); his *Commentaries to Aristotle's Categories* is now published in the great Berlin edition of the *Commentaries to Aristotle*, vol. iv., ed. by Busse (Berlin, 1887); *Porphyrii de Philosophia ex Oraculis Haurienda Librorum Reliquia*, ed. Gustav Wolff (Berlin, 1856); *Quæstiones Homericæ*, ed. Schraeder (Leipzig, 1880-82). Translation of *Select Works*, by Taylor (London, 1823); *Sentences*, by Davidson (ib., 1869). Consult: Zeller, *Philosophie der Griechen* (3d ed., Leipzig, 1881); and for Porphyrius's relation to Christianity, Kleffner, *Porphyrius der Neuplatoniker und Christenfeind* (Paderborn, 1896).

PORPHYRY (OF., Fr. *porphyre*, from Gk. πορφύρος, *porphyros*, purple, from πορφύρα, *porphyra*, purple fish). A term formerly much employed to designate in a general way any rock of porphyritic texture (see IGNEOUS ROCKS), and in a special sense, such rocks when of siliceous composition and having the larger crystals (porphyritic crystals) chiefly of orthoclase feldspar or orthoclase feldspar and quartz. Thus quartz porphyry included the finer grained granites occurring as bosses or dikes.

PORPOISE (OF. *porpeis*, *porpois*, *pourpois*, dialectic Fr. *porpeis*, from Lat. *porcus*, swine, hog, pig + *piscis*, fish; cf., with reversed order of components, Port. *peixe porco*, Oit. *peixe porco*, porpoise). A small active cetacean, of the family Delphinidæ, having a form similar to the dolphins, but the muzzle short, uniformly convex, and without a beak; a dorsal fin; the teeth numerous, simple, and equal. The common porpoise (*Phocæna communis*) is plentiful in all northern seas and is only 6 to 8 feet in length. The body is spindle-shaped, the skin perfectly smooth and destitute of hair, and there are from 40 to 50 teeth in each jaw. The eye is rather small, with the pupil in the form of a V, and the opening of the ear is very minute. The crescent-shaped blow-hole is situated between the eyes. Large numbers are often seen together, sometimes gamboling, sometimes swimming in file, when their backs, appearing above the surface of the

water, are apt to suggest the idea of a great sea-serpent. They feed on fish, and pursue the herring, mackerel, etc., into bays and estuaries. The porpoise sometimes ascends rivers, apparently in pursuit of salmon, as far as the water is brackish, and is not infrequently caught on such occasions, for the sake of its skin, oil, and flesh. The skin is nearly an inch thick, but is planed down until it becomes translucent, and is made into excellent leather, which is used for shoe-

SKUNK, OR BAY PORPOISE.

strings and for other purposes. Under the skin is a layer of fat, about an inch in depth, which yields oil of the finest quality. The flesh was in former times highly esteemed, but it is now little eaten by civilized people. Several other species of *Phocæna* occur in the South Atlantic, Indian, and Pacific Oceans, while the name 'porpoise' is carelessly extended to almost any of the smaller dolphins. Consult: Beddard, *A Book of Whales* (London, 1900); Goode, *Fishery Industries*, see i. (Washington, 1884); True, *Bulletin of the United States National Museum*, No. 36 (ib., 1889).

POR/PORA, NICCOLÒ ANTONIO (1686-1766). A famous Italian composer, born at Naples. He studied music under Padre Gaetano, of Perugia, and possibly under Scarlatti. He produced his first opera, *Basilio, re di Oriente*, in 1709. *Berenice* followed in 1710. He began the work for which he subsequently became famous in 1712, when he founded the music-school in Naples, which numbered among its pupils Farinelli, Tosi, Senesino, and Caffarelli. He held many important appointments in Austria, Prussia, and Italy; and in 1728 became singing-master to the royal family at Dresden, in which city he also became concert-master of the opera. The following year he was invited to go to London, where a considerable opposition had been organized against Handel (q.v.). Although some of his best work was written and produced in London, he could not succeed against his rival, and returned in 1736 to Venice, where he was appointed director of the Conservatory. After a period of about nine years he went to Vienna in the train of the Venetian ambassador, and during the three years of his stay was held in high repute as a teacher. Haydn studying under him part of the time. He went to Dresden in 1748, where he became Court kapellmeister until 1751, when he returned to Naples.

PORRIGO. See FAVUS; RINGWORM.

PORSE'NA, or **PORSE'NNA**, LARS. In the early and uncertain history of Rome, a powerful King of Clusium (now Chiusi), in Etruria. According to the legend told by Livy, when Tarquin the Proud was expelled from Rome he sought the help of his Etruscan kinsmen in Veii and Tarquinii, against his revolted subjects; but their efforts not proving successful, he turned to Porsena, who willingly espoused his cause, and marched a great army against Rome. The Etrus-

can King seized the Janiculum, a fortified hill on the west side of the Tiber, and would have forced his way into the city across the "Bridge of Wooden Piles" (*pons sublicius*), had not a brave Roman, Horatius Cocles, kept the whole of Porsena's army at bay, while his comrades behind him hewed down the bridge; after which he plunged into the Tiber, and safely swam across its waves. Porsena, we are informed, now laid siege to Rome, and after a while the inhabitants began to suffer so severely from famine that they had recourse to a desperate expedient. Three hundred of the noblest Roman youths swore to risk their lives in an attempt to assassinate the Etruscan King. The first on whom the lot fell was C. Mucius, who stole into the camp of Porsena, but, not knowing the person of the King, killed his secretary instead. He was instantly seized, and put to the torture; but the unshrinking audacity with which he thrust his hand into the fire and let it burn moved the King so much that he pardoned him, whereupon Mucius (ever afterwards called *Scævola*, 'the left-handed') told him of the jeopardy in which he was placed.

Porsena resolved to make peace with Rome at once, and, his conditions being accepted by the sorely pressed citizens, he withdrew his forces. This version of the story is believed to have been invented to conceal the fact of a temporary Etruscan conquest, and the evidence in favor of this view is overwhelming. Tacitus expressly affirms that Porsena conquered the city; Dionysius informs us that the senate sent him an ivory sceptre, a golden crown, and a triumphal robe, which was the form that had been adopted by the Etruscan cities themselves of acknowledging the supremacy of the Roman King, Tarquinius Priscus; and Pliny mentions that Porsena forbade the citizens of Rome to use iron, except for agricultural purposes. What seems most reasonable to believe is that a great rising of the Etruscan against the Latin races took place, and that Rome was exposed to the first brunt of the war, and suffered a disastrous defeat, but that shortly after the Etruscans themselves were decisively beaten, and forced back into their own territories; for after the conquest of Rome Aruns, a son of Porsena, proceeded against Aricia, under the walls of which city (according to Livy) his army was routed by the combined forces of the Latin cities, with the help of Greek auxiliaries from Cumæ.

POR'SON, RICHARD (1759-1808). A brilliant Greek scholar, born December 25, 1759, at East Ruston, Norfolk, England, where his father, a worsted weaver, was parish clerk. The curate of the parish, Mr. Hewett, impressed by the boy's rare abilities, had him educated along with his own sons. Porson afterwards found a patron in Mr. Norris, the founder of the Norrisian professorship at Cambridge, who sent him to Eton in 1774, where he remained about four years, without, however, distinguishing himself remarkably. Another patron, Sir George Baker, sent him, in 1778, to Trinity College, Cambridge, of which he was elected a scholar in 1780. In 1781 he won the Craven scholarship and the first chancellor's medal. In 1782 he was chosen a fellow of Trinity. He now began to give indications of his subtlety and taste in the difficult verbal criticism of the Greek dramatists. For four years he contributed to *Maty's Review*—his first critique

being on Schutz's Æschylus, and his finest on Brunck's Aristophanes. He also opened a correspondence with Professor Ruhnken. In 1787 he contributed to the *Gentleman's Magazine* three sarcastic letters on Hawkins's *Life of Johnson*. For the same periodical he also wrote his far more famous and trenchant *Letters to Travis on the Three Witnesses* (1788-89). The question concerned the disputed text I. John v. 7, and was occasioned by a pretentious defense of the passage by Archdeacon Travis against the scornful attack of Gibbon. Porson naturally incurred great odium on account of the side he took in this controversy. One old lady who had him in her will for a legacy of £300 cut it down to £30 when she heard that he had written a book against Christianity. Porson's fellowship being vacated by his refusal to take orders, his friends now procured for him an annuity of £100. He was also appointed to the regius professorship of Greek in the University of Cambridge, an office worth £40 a year. The only thing he ever did in connection with his Greek professorship was to deliver a Latin prelection on Euripides, written, it is said, in two days. In 1795 he edited the plays of Æschylus for the Foulis Press at Glasgow; and between 1797 and 1801 four of Euripides, the *Hecuba*, the *Orestes*, the *Phænissæ*, and the *Medea*. He also collated the Harleian manuscript of the *Odyssey* for the 'Grenville' Homer. In 1806 he was appointed librarian of the London Institution with a salary of £200, but neglected his duties. By this time Porson had weakened in mind and body. Ever since the loss of his fellowship he had lived mostly in London, occupying rooms at Essex Court in the Temple. There he would confine himself to work for days; and for years he had been at times a hard drinker. He died of apoplexy, September 25, 1808, and was buried in the chapel of Trinity College, Cambridge.

Porson was famed for his wit and learning, and, unfortunately, for the negligence with which he treated persons to whom he owed courtesy. His burlesque of Hawkins has been compared with Thackeray at his best. He certainly was a master of irony. His contributions to the knowledge of Greek syntax and metres are solid and permanent. To the emendation of texts he brought rare keenness and a marvelous memory. Though more scientific methods now prevail, especially in textual collation, it is generally agreed that Porson opened the way to the new era. After his death, several works left in manuscript were published: *Ricardi Porsoni Adversaria* (1812), *Tracts and Miscellaneous Criticisms* (1815), *Pausanias* (1820), *Lexicon of Photius* (1822), *Notes on Suidas* (1834), and *Correspondence*, edited by Luard (Cambridge, 1867). Consult the *Life* by Watson (London, 1861); *Table Talk of Samuel Rogers* (ib. 1856); and Luard, *Cambridge Essays* (ib., 1857).

PORT (of uncertain etymology). (1) A naval term to denote the left side of a vessel to an observer looking forward. See HELM. (2) In architecture the term port is used as an equivalent of portal (q.v.).

PORTA, CARLO (1776-1821). An Italian poet, born in Milan. He was employed in the Bureau of Finance in Venice, and afterwards in Milan. Manzoni, Grossi, and others of the Romantic School in Milan were his intimate friends.

His poems are mostly in the Milanese dialect. They are remarkable for their satirical wit and vivacity, and are exact descriptions of local manners. The best known of them is *Le disgrazi di Giovanni Bongee*. His works were published by his friend Grossi in 1821.

PORTA, GIACOMO DELLA (1542-1604). An Italian architect, born at Milan. He was the pupil of Vignola and Michelangelo, and completed various works left unfinished by both his masters. The most important of these was the cupola of Saint Peter's in Rome, which he slightly altered from the original designs, and was working over in 1564. Other building work of his in Rome includes the completion of the Church of II Gesù, begun by Vignola; the Farnese Palace, begun by Michelangelo; the Greek Church, in the Via Babuino; the Church of the Madonna dei Monti; the facade of the Church of San Luigi de' Francesi; and the palaces Paluzzi, Chigi, Serlupi, and d'Este. He also built in Rome some fine fountains, in which his taste for the decorative in architecture showed itself. Of these, an especially noted one is the Fontana delle Tartarughe. Other works by Porta are the Chapel of Saint John the Baptist in the cathedral at Genoa, and the Villa Aldobrandini, near Frascati.

PORTA, GIAMBATTISTA DELLA (1543-1615). An Italian savant, born at Naples. He traveled widely in Spain, France, and Italy, and founded an association known as *I segreti*, for the purpose of carrying on scientific investigations. Accused of practicing magic, the society was dissolved by the Pope. Porta studied optics successfully and invented the camera obscura. He wrote widely on scientific topics with much learning and much blundering. His most important works are *De Humana Physiognomia* (1586), *Magis Naturalis* (1589), *Ars Reminiscendi* (1602), *De Aëris Transmutationibus* (1609).

PORT ADELAIDE, äd'e-läd. The port of the city of Adelaide (q.v.), South Australia.

PORTADOWN. A town of Ireland in County Armagh, situated on the Great Northern Railroad 5 miles south of Lough Neagh (Map: Ireland, E 2). It has manufactures of linen and cotton goods and trade in agricultural products. Population, in 1901, 10,046.

PORTAELS, pör-täls', JEAN FRANÇOIS (1818-95). A Belgian historical and portrait painter, born at Vilvorde, near Brussels. He studied in the Academy of Brussels, and in Paris under Paul Delaroche, and in 1842 he took the Prix de Rome. After extensive travels in the Orient, in 1847 he was appointed director of the Academy of Ghent. Later, after further travels, he became director of the Academy of Brussels. Among his best known works are "A Funeral in the Desert of Suez," and "A Caravan in Syria Overtaken by a Simoom." At an exhibition of paintings in Sydenham Palace in 1873, he received a special gold medal for the finest picture, "A Drought in Egypt." His works are rather good in composition, but are painted in the smooth manner of the school of Delaroche.

PORTAGE. A city and the county-seat of Columbia County, Wis., 90 miles west by north of Milwaukee; on the Government ship canal between the Fox and Wisconsin rivers, and on the Wisconsin Central and the Chicago, Milwaukee and Saint Paul railroads (Map: Wisconsin, D 5).

It has a public library, and among the prominent buildings are the high school and the city hall. Portage is the commercial centre of a productive farming section, and manufactures hosiery and knit goods, brick, flour, etc. The government is administered, under a charter of 1900, by a mayor elected biennially and a unicameral council. There are municipal water-works. Portage was settled in 1835 and was chartered as a city in 1854, having been first incorporated two years earlier. Near the city limits are the remains of old Fort Winnebago, which was built in 1828. Population, in 1890, 5143; in 1900, 5459.

PORTAL (OF. *portal*, Fr. *portail*, from ML. *portale*, entrance, vestibule, neu. sg. of *portalis*, relating to a gate, from Lat. *porta*, gate). A doorway or gateway; and, by extension, an architectural structure having for its chief object the inclosing and containing of such doorway, or several doorways. The French term, *portail*, of similar meaning, is often applied to the whole west front of a church, or to the northern or southern transept-front, or to the lower part of such a front in which the doorways are opened. This usage has influenced English writers to a certain extent, and the group of doorways at one front or flank of a building, with the architectural accessories, such as gables, canopies, columns, and the like, is often a portal. The *porte cochère* of a large French building, that is, the great doorway through which a carriage or wagon can be driven, is properly called a portal.

The portal and the porch (q.v.) are not to be separated absolutely. Thus where, as in the Palazzo Canossa at Verona, there is a triple archway of entrance, the three arches taken together may be considered a portal of three openings; or the square hall into which they lead, taken with the arches, may be considered a porch, in which case the arches in the outer wall form a part of it.

PORTALEGRE, pŏr'tá-lá'grá. The capital of the district of the same name in Portugal, situated near the Spanish frontier, 95 miles northeast of Lisbon. It is a fortified town, and has a handsome cathedral. It manufactures woolen goods, and cork is obtained in the vicinity. Population, in 1900, 11,893.

PORTALIS, pŏr'tá'lès', JEAN ETIENNE MARIE (1746-1807). A French jurist and statesman, born at Le Beausset, near Toulon. He studied law at the University of Aix and in 1765 was admitted to practice before the provincial Parliament. Charged with a commission to investigate the legal status of the Protestants in France, he published in 1771 *Consultation sur la validité des mariages des protestants en France*, in which he established the character of marriage as a civil contract, the general tone of the work being wholly favorable to religious toleration. From 1778 to 1782 he was provincial assessor of Provence, returning subsequently to the practice of law. Always moderate in his views, Portalis retired to his estate when the Revolution entered upon its stormy phase. He was compelled to flee to Lyons and thence to Paris, where in December, 1793, he was arrested. He was liberated on the fall of Robespierre and in 1795 was elected to the Council of Ancients, of which in June of the following year he became president. His clemency to the adherents of the old régime aroused the hostility of the Directors, and after the coup

d'état of the 18th Fructidor (September 4, 1797) he escaped deportation by seeking refuge abroad. Returning in 1800, he was made by Napoleon a member of the commission charged with the preparation of a civil code. He took a most important part in the labors of the commission, for which he was peculiarly fitted by his extensive knowledge of the civil law. After the conclusion of the Concordat (1801) Portalis was intrusted with the task of formulating a body of supplementary rules to serve as a basis for the administrative policy of the State with regard to the Catholic religion. Made Minister of Public Worship in 1804, he effected important changes in the organization of religious instruction. In 1806 he became a member of the Academy. He died in Paris August 25, 1807. Consult: Lavolée, *Portalis, sa vie et ses œuvres* (Paris, 1869); Sainte-Beuve, *Causeries du lundi*, vol. v. (Paris, 1852).

PORTAL VEIN. See LIVER; CIRCULATION.

PORTA MAGGIORE, pŏr'tá mád-jŏ'rá. The ancient Porta Prænestina at Rome, a gate with two arches, one of which is now closed, through which issued the Via Prænestina and the Via Labicana. It was the meeting-place of the water systems of the ancient city, and was originally designed to carry the Aqua Claudia and the Anio Vetus over the two roads. Its inscriptions record its construction and restorations. It was included as a gate in the walls of Aurelian. During the restoration of the walls by Arcadius and Honorius the level of its threshold was raised ten feet by the leveling of the accumulated rubbish.

PORTAMEN'TO (It., carriage). A musical term used to denote the sustaining of the voice in passing from one note to another. In legato the voice passes directly from one tone to the next, while in portamento it passes through all intermediate tones. But this passing is so rapid that no single tone is heard separately. The effect of portamento can best be attained upon a stringed instrument played with a bow. The finger quickly glides along the string from one note to the next.

PORTA NIGRA, pŏr'tá nŏ'grá (Lat., Black Gate). A famous gateway of Treves, dating probably from the fourth century A.D. It is constructed of sandstone, and is blackened with age, whence its name. The gate was closed by a porteullis and fortified by two towers, one of which was occupied early in the eleventh century by Simeon, a Greek hermit, and from this fact the gate is called also Simeonsthor. A number of Roman antiquities are preserved in the interior.

PORT ANTONIO. A seaport town on the northern coast of Jamaica (Map: Cuba, J 8). It is the second commercial town of the island and is the centre of the fruit trade. It is connected by rail with Kingston.

PORTA PRÆ'NESTINA. See PORTA MAGGIORE.

PORT ARTHUR (Chin. *Lü-shun K'ow*). A town and strongly fortified naval station near the Lao T'ieh Shan promontory of the peninsular portion of the Manchurian province of Shing-king or Fung-t'ien fu, leased by China to Russia with certain adjacent territory for a period of 25 years under an agreement dated March 27, 1898 (Map: China, F 4). The object of Russia was to secure

a naval station which she could defend for the use of her war vessels in Eastern waters, and the lease was granted with the distinct understanding that "it shall not prejudice China's sovereignty over the territory." It was further agreed that the port should be closed to all vessels except Chinese and Russian men-of-war. The town lies on the slope of the high hills which surround the oval inlet which forms the harbor, in lat. 38° 48' N. and long. 121° 20' E. The inlet on which it stands measures about two miles from east to west and one from north to south, and is well protected from storms by a spit of land which runs diagonally across its northern end. The harbor proper has been much enlarged by blasting and dredging; new docks, barracks, an arsenal, and warehouses have been built, and the place rendered impregnable. On the west side of the town is the terminus of the Russian railway to Harbin. See MANCHURIA.

Lü-shun K'ow was formerly only a small fishing village at the lower end of a long mountainous peninsula until it was selected by Li Hung Chang under the advice of German engineers for a strongly fortified naval station for the defense of the Pei-ho and Peking. In 1894, however, it was captured by the Japanese, and the Treaty of Shimonoseki provided for its cession to Japan with the whole southern coast of Manchuria from the Liao to the Yalu; but Russia, France, and Germany intervened and induced Japan to relinquish all this territory for the sum of 30,000,000 taels, and on November 30, 1895, its evacuation was begun. Consult "Some Facts About Port Arthur," in *United Service Magazine*, vol. cxlvi. (London, 1902). See DALNY; SHING-KING; and TA-LIEN WAN.

PORT-AU-PRINCE, pôrt'ô'prâns', or **PORT RÉPUBLICAIN**. The capital and principal seaport of Haiti, Western Indies, situated on the western coast of the island, opposite the island of Gonaïve (Map: West Indies, L 5). It lies in a marshy region and, although well laid out, is in a general state of decline and quite unsanitary. It is built largely of wood and is partly in ruins, as a result of the earthquakes of the eighteenth and nineteenth centuries. The principal buildings are the wooden palace, the Senate building, and the cathedral. The town contains also the mint, the custom house, a lyceum, and a college. The harbor is safe and fortified. The population of the city is estimated at 61,000. Consult Fortunat, *Nouvelle géographie de l'île de Haïti* (Port-au-Prince, 1888).

PORT CHESTER. A village in Westchester County, N. Y., 26 miles northeast of New York City; on Long Island Sound and on the New York, New Haven and Hartford Railroad (Map: New York, G 4). It enjoys considerable popularity as a summer resort and is also a residential suburb of New York. There are a free library, besides public school libraries, a public hospital, and three fine bank buildings; also a park (Monument). The village has large nut and bolt works, foundries, and manufactures of shirts, carriages, etc. The government is vested in a president and board of trustees, elected biennially. Port Chester was settled probably as early as 1742, and was known as Saw Pit until 1837, when the present name was adopted. It was incorporated as a village in 1868. Population, in 1890, 5274; in 1900, 7440.

PORT CLINTON. A village and the county seat of Ottawa County, O., 31 miles east by south of Toledo; on Lake Erie, at the mouth of the Portage River, and on the Lake Shore and Michigan Southern Railroad (Map: Ohio, E 2). It has a fine harbor, and is the commercial centre of a region engaged largely in fruit-growing. There are also large lime, plaster, and stone interests. The mining of gypsum, basket-making, and fishing are other important industries. Population, in 1890, 2049; in 1900, 2450.

PORTCULLIS (OF. *porte coleice*, *porte coulisse*, sliding gate, from *porte*, from Lat. *porta*, gate, and *coleice*, *coulisse*, fem. of *coleis*, *coulis*, sliding, from Lat. *colatus*, p. p. of *colare*, to flow, to strain, from *colum*, sieve). A frame of iron, or wood strengthened with iron, made in the form of grating, designed to slide in vertical grooves built in the jambs of the entrance gate of a fortified place, in order to defend the gate in case of assault. The vertical bars were pointed with iron below, and struck on the ground when the grating was dropped, so as to injure whoever or whatever they fell upon. (See CASTLE.) In heraldry (q.v.) the portcullis is represented with rings at its uppermost angles, from which chains depend on either side. It was a badge of the Beaufort family, and borne in virtue of their Beaufort descent by the Tudor sovereigns. Portcullis is the title of a pursuivant in the English college of arms, whose office was instituted by Henry VII.

PORT DE PAIX, pôr de pâ. A town and port of Haiti, on the Tortuga Channel, one hundred miles north of Port-au-Prince, and on the right bank of the Trois Rivières at its mouth (Map: Antilles, L 5). The agricultural interests of the section are largely devoted to coffee. The population is estimated at 10,000. Columbus visited the port in 1492 and named it Valparaiso. It was taken by French filibusters in 1665.

PORT DURN'FORD. A seaport in British East Africa at the mouth of the Sheri River (Map: Africa, J 5).

PORTE, **SUBLIME PORTE**, or **OTTOMAN PORTE**. The name given to the Turkish Government. The origin of this name is to be referred to the ancient Oriental custom of making the gates of cities and of kings' palaces places of assembly in connection with the affairs of government and of the administration of justice. In the Byzantine Empire this custom was adopted, and the term was transferred from the high gate of the Imperial palace to the Government whose authority was there exercised. The Turks found the term in common use among the Byzantines some time previous to their establishment at Constantinople, and adopted it on the organization of their empire. The use, among European nations, of the French term *sublime porte* ('lofty gate') is accounted for by the fact that French is the language of European diplomacy. See TURKEY.

PORTE CRAYON (Fr., pencil-holder). The pseudonym of the American author and illustrator David H. Strother (q.v.).

PORT ELIZ'ABETH. The largest and most important city of Cape Colony next to Cape Town. It is situated on Algoa Bay 400 miles east of Cape Town, on the barren peninsula of Cape Recife (Map: Cape Colony, K 9). It is a well-built city. There are fine, substantial pub-

lic buildings, and large commercial houses. There are also a college and other schools, and a botanical garden, the latter irrigated from the city's water supply, which is brought over an aqueduct 28 miles long. The location of Port Elizabeth midway between Cape Town and Durban, and at the nearest point on the coast from Kimberley, with which it is connected by a railroad, gives the town great commercial advantages. Its harbor, partly sheltered by the cape, is being further improved by great engineering works. The imports in 1898 were valued at \$30,355,560, and the exports, chief of which were gold, diamonds, wool, ostrich feathers, and hides, amounted to \$10,220,580. Population, in 1891, 23,266.

PORTEOUS RIOT. An uprising in Edinburgh on the night of September 7, 1736. John Porteus, captain of the city guard of Edinburgh, was hated by the populace, and when on April 14, 1736, he superintended the execution of an Edinburgh merchant, Andrew Wilson, who had robbed a custom-house, disturbances were feared, especially since the sympathy of the people was with smugglers and their allies. The mob remained quiet until Wilson was dead and then began to throw stones. Porteous, without any warning, ordered his soldiers to fire into the crowd and did likewise himself. Six or seven persons were killed and twenty wounded. Porteous was brought to trial, found guilty, and condemned to death. He, however, petitioned the Government and a reprieve was granted. This aroused the people and some men in disguise forced the jail on the night of September 7th, took out Porteous and hanged him. As a result a bill was passed by Parliament which disqualified the provost of Edinburgh from holding any Government office in the future, and fined the city £2000 for the benefit of the widow of Porteous. The participants in this riot were never discovered, but it was believed that people of high social and official standing were connected with it. The plot of Sir Walter Scott's *Heart of Midlothian* turns upon some of the supposed happenings of the Porteous riot.

PORTER. See BEER.

PORTER, ALEXANDER (1786-1844). An American jurist, who remodeled the jurisprudence of Louisiana. He was born near Armagh, Ireland, came to America in 1801, was admitted to the bar in Nashville, Tenn., in 1807, and, removing to Saint Martinsville, La., became a member of the Constitutional Convention in 1811. His greatest labor was as judge of the Supreme Court of the State (1821-33), when he helped in the establishment of a new legal code. He was a Whig Senator (1834-37), a friend of the United States Bank scheme and of Texan independence, an advocate of the division of surplus revenues among the States, and an opponent of the abolition of slavery in the District of Columbia. Re-elected to the Senate in 1843, he served until his death.

PORTER, BENJAMIN C. (1843—). An American portrait and figure painter. He was born in Melrose, Mass., August 27, 1843. From 1872 to 1881 he studied at different times in Europe, especially in Venice and Paris. Porter at first devoted himself to figure painting, but of late years has chiefly painted portraits. In 1880 he became National Academician, and took studios in New York City and Boston. His best works include:

"Henry V. and the Princess Kate" (1868); "Cupid with Butterflies" (1874); "Portrait of Lady with Dog" (1876); and "Portrait of Boy with Dog" (1884). Porter's pictures are always agreeable in color, and he has a good sense of composition. In 1900 he won a medal at the Paris exhibition.

PORTER, CHARLES T. (1826—). An American mechanical engineer. He was born at Auburn, N. Y., graduated at Hamilton College in 1845, practiced law for several years, and then became an engineer, forming a partnership with John F. Allen to control the Porter-Allen engine. This firm was the first to use with success high rotative speed in stationary engines. Porter was the inventor of a central counterpoise governor for steam engines (1859) and of an isochronous centrifugal governor for marine engines (1861), and the author of *Mechanics and Faith, Spiritual Truths in Nature* (1885).

PORTER, DAVID (1780-1843). A distinguished American naval officer. He was born in Boston, and was the son of a naval officer in the Revolution. In 1798, after some experience on merchant vessels, in the course of which he was twice impressed by the British, but each time escaped, he entered the navy as a midshipman. In the following year he served on board the *Constellation* in her fight with the French frigate *L'Insurgente*. Being made a lieutenant in the following year, he served in the war with Tripoli, and in 1803 was captured with the *Philadelphia*, and remained a prisoner until peace was made.

During the first year of the War of 1812, as commander of the frigate *Essex*, 32 guns, he captured several English merchant vessels, a transport, and the corvette *Alert*, 20 guns. In the following February he entered the Pacific, and for almost a year preyed with great success upon the English whale-shipping in that ocean. On this cruise he was accompanied by young David G. Farragut (q.v.), whom he had adopted in 1809. After inflicting much damage upon the enemy, the *Essex* was blockaded in the port of Valparaiso by two English vessels, the *Phoebe*, of 36 guns, and the *Cherub*, of 20 guns. Porter offered to fight either singly, but as this offer was refused, he made an attempt on the 28th of March to get to sea, with the result that in doubling a headland his vessel was struck by a squall, which carried away her foretopmast and drowned several of her crew. Porter then returned to the harbor and anchored his vessel less than three miles from the town and only half a mile from the shore. Here, disregarding the rules of neutrality, the British attacked her, and after a bloody and unequal conflict of two hours and a half forced her to surrender. Despite the loss of his vessel, however, Porter was upon his return home received with great honors.

His career after the close of the war was a varied one. In 1824, being now a commodore, he was sent in charge of an expedition against the West Indian pirates. In the performance of this duty he compelled the Spanish authorities at Fajardo, Porto Rico, to render an apology for an insult to his flag; for this action he was afterwards court-martialed, and on the ground that he had exceeded his authority he was suspended from the service for six months. Disgusted with this treatment, he resigned, and entered the Mexican navy as rear-admiral. He remained in this

service until 1829, and then, being dissatisfied with it, resigned. He was soon afterwards appointed consul-general to the Barbary Powers by President Jackson, and was later transferred as chargé d'affaires to Constantinople, where he died in 1843. Porter published a *Journal of a Cruise Made to the Pacific Ocean by the United States Frigate Essex* (1815; 1822), a defense of his conduct at Foxardo (1825), and *Constantinople and Its Environs* (1835). Consult David Dixon Porter, *Life of Commodore David Porter* (Albany, 1875).

PORTER, DAVID DIXON (1813-91). A distinguished American admiral. He was a son of Commodore David Porter, and was born in Chester, Pa., June 8, 1813. In 1824 he accompanied his father on his expedition against the West Indian pirates, and when his father became Admiral of the Mexican navy he entered the same service as a midshipman. While serving under his cousin, Captain David H. Porter, who was in command of a Mexican vessel cruising against Spanish commerce, young Porter took part in a desperate engagement with a much superior Spanish frigate. The vessel on which he was serving was captured, and he was for a short time confined in the guard-ship at Havana. Soon after his release he was commissioned a midshipman in the United States navy, and served until 1835 on the European station. In 1846 he was sent by the Secretary of War on a secret mission to Haiti, and then served with distinction in the Mexican War as a lieutenant and afterwards as commanding officer of the *Spitfire*. After the close of that struggle he obtained a furlough, and for some years commanded private passenger steamers.

The Civil War gave Porter the opportunity to distinguish himself. The beginning of that struggle found him a lieutenant on shore duty; in a little more than two years he was a rear-admiral in command of a squadron. His first service in the war was to assist as commander of the *Powhatan* in the relief of Fort Pickens. Shortly afterwards he was advanced to the rank of commander. A little later, largely through his recommendation, Farragut was given command of the Western Gulf Blockading Squadron which was to operate against New Orleans, and Porter was put in charge of the fleet of bomb-vessels under him. By Farragut's order, Porter in April, 1862, began a bombardment of Forts Jackson and Saint Philip, which guarded the way up the Mississippi, and after six days and nights, in the course of which he threw into them more than 16,000 shells, he reduced them to such a condition that Farragut's fleet was able to pass them and capture New Orleans. Four days later the forts themselves surrendered to Porter. During the next few months he served with great credit in the operations between New Orleans and Vicksburg. In September, 1862, he was put in charge of the Mississippi Squadron as acting rear-admiral. He improvised a navy-yard at Mound City, and soon increased his squadron of about a dozen effective vessels to more than 120 by converting ordinary river steamers into gunboats. With a part of this fleet he, in January, 1863, assisted the army in the capture of Arkansas Post, and next succeeded in running past the batteries of Vicksburg and reducing the Confederate forts at Grand Gulf. He then cooperated

with General Grant in the siege of Vicksburg, and upon the surrender of that place received the thanks of Congress and a commission as rear-admiral. In the spring of 1864 he assisted General Banks in the disastrous expedition up the Red River, and it was only by the greatest exertions that he succeeded in saving his vessels. (See BAILEY, JOSEPH.) In the same year he was put in command of the North Atlantic Blockading Squadron. While in this command his most important service was in cooperating in the capture of Fort Fisher, which was taken by assault on the 15th of January, 1865, after a long and destructive bombardment by his fleet. For this service he again received the thanks of Congress.

After peace came, he served from 1865 to 1869 as superintendent of the Naval Academy at Annapolis, and did much to increase the efficiency of that institution. In 1866 he was promoted to be vice-admiral, and in 1870, upon the death of Farragut, was advanced to the highest of all naval ranks, that of admiral. He died in Washington in 1891.

Admiral Porter wrote a life of his father, Commodore David Porter (1875); *Incidents and Anecdotes of the Civil War* (1885); *History of the Navy in the War of the Rebellion* (1887); two novels, *Allan Dale* and *Robert le Diable* (1885) and *Harry Marline* (1886); a posthumous novel-ette, *A Romance of Gettysburg*, which appeared in the *Criterion* for 1903; and articles for various publications.

Consult: Soley, *Admiral Porter* (New York, 1903), in the "Great Commanders Series;" Chesney's *Essays in Military Biography* (New York, 1874); and Johnson and Buel (eds.), *Battles and Leaders of the Civil War* (New York, 1887).

PORTER, FITZ JOHN (1822-1901). A distinguished American soldier. He was born at Portsmouth, N. H., graduated at West Point in 1845, and was assigned to the artillery, in which he became second lieutenant the following year. He served in the war with Mexico from the beginning; was wounded in the attack on the City of Mexico, September 13, 1847; and was brevetted captain and major for gallantry in the battle of Molino del Rey and the storming of Chapultepec, respectively. After the war he was sent to West Point, where he served as adjutant of the post, and as instructor of artillery and cavalry. In 1856 he was transferred to the Adjutant-General's department, and was assistant adjutant-general of the Utah expedition under Albert Sidney Johnston in 1857. On May 14, 1861, he received the appointment of colonel of the 15th Infantry; was made brigadier-general of volunteers in the same month, and served as chief of staff with General Banks and General Patterson until August, when he was put in command of a division in the Army of the Potomac. He had charge of the siege operations against Yorktown during the Peninsular campaign, acted as military governor of the place for a time after its evacuation, and was then given the command of the 5th Army Corps, which fought the battles of Mechanicsville and Gaines's Mill, and bore the brunt of the fight at Malvern Hill. He was appointed brevet brigadier-general in the Regular Army for gallantry at the battles of the Chickahominy, and on July 4, 1862, was commissioned major-general of volunteers. At the second battle of Bull Run his failure to move forward on the first-day of the en-

agement led to his trial by court-martial on the charge of disobeying the orders of General Pope. He was found guilty and was cashiered and disqualified from holding any position of trust or profit under the United States Government. The justice of the punishment was a subject of much controversy, and numerous attempts were made to secure a reversal of the verdict.

In June, 1878, a board of officers convened at West Point, by order of the President, to examine the evidence and to consider the findings of the court-martial, and to report to the Secretary of War what action, in their judgment, justice required should be taken by the President. This board, after a full examination of the case, including evidence before inaccessible, and other evidence before misunderstood, reported that, in the opinion of those forming it, justice required at the hands of the President of the United States "such action as may be necessary to annul and set aside the findings and sentence of the court-martial in the case of Major-General Fitz John Porter, and to restore him to the position of which that sentence deprived him—such restoration to take effect from the date of his dismissal from office." This report was signed by the entire board, including Major-General J. M. Schofield, Brigadier-General Alfred H. Terry, and Brevet Major-General George W. Getty. The report was laid before the House Committee on Military Affairs, and a majority of the committee, in January, 1881, reported a bill restoring him to his rank of major-general in the United States army, and requiring the Secretary of the Treasury to pay to him the sum of \$75,000. The bill for his relief failed to pass, but President Arthur in 1882 remitted the disqualifying clause in his sentence. In 1886 a bill for his restoration to the army with the rank of colonel, but without back pay, was passed and approved by the President, and soon afterwards General Porter was retired.

After his return from the army General Porter engaged in business in New York City, where he afterwards held several municipal offices, among them that of Police Commissioner and Commissioner of the Fire Department. Until his death he considered that he had been deeply wronged. The controversy regarding his treatment provoked a mass of partisan articles and of reviews of the evidence of the case, but no adequate biography has yet appeared. For perhaps the strongest statement of the case against Porter, consult Cox, *The Second Battle of Bull Run as Connected with the Fitz John Porter Case* (Cincinnati, 1882); for a brief statement of the case in his favor, consult an article by General U. S. Grant in vol. exxxv. of the *North American Review*.

PORTER, HORACE (1837—). An American soldier and diplomat, son of David Rittenhouse Porter and grandson of Andrew Porter. He was born at Huntingdon, Pa.; studied for a year at the Lawrence Scientific School, Harvard, then entered West Point, where he graduated in 1860, and a year later was commissioned first lieutenant and detailed for duty as ordnance officer of the Port Royal Expeditionary Corps. At the reduction of Fort Pulaski, Ga. (April 10-11, 1862), he was the chief of ordnance and artillery, and by his gallantry earned the brevet rank of captain. In the attack on Secessionville, S. C. (June 16, 1862), he was wounded, but was

able to act as chief of ordnance in the transfer of the Army of the Potomac from Harrison's Landing, Va., to Maryland, after the Peninsular campaign of 1862. He was then assigned to duty in the West and participated in the Tennessee campaign (June 24-November 1, 1863), during which he fought at the battle of Chickamauga and took part in the defense of Chattanooga. On April 4, 1864, he was promoted to be lieutenant-colonel and was assigned to the staff of General Grant, with whom he remained until July 25, 1866, taking part in all the battles of the Richmond campaign until the surrender at Appomattox Court House. On March 13, 1865, he received the brevet rank of brigadier-general in the Regular Army. After the war, when General Grant was for a few months in 1867 Secretary of War, Porter became his assistant, and when Grant was elected to the Presidency Porter became his private secretary. In 1873 he resigned from the army to become vice-president of the Pullman Car Company, and during the following years he filled executive positions on several railroads. In 1897 President McKinley appointed him Ambassador to France. General Porter became well known as an orator and as an author. His writings include *West Point Life* (1866); *Campaigning with Grant* (1897); and the articles on "Five Forks and the Pursuit of Lee" and "The Surrender at Appomattox Court House," in *Battles and Leaders of the Civil War* (1887).

PORTER, JAMES (1753-98). An Irish clergyman and author, the son of a poor farmer. He was born near Ballindrait, in the County of Donegal. Leaving his father's farm, he taught school, and later he studied for the Presbyterian ministry at Glasgow. In 1787 he was ordained minister at Greyabbey, in the County of Down. For the Belfast *Northern Star*, a newspaper founded by Samuel Neilson in the interests of the Society of United Irishmen, Porter wrote several patriotic songs (1794), republished as *Paddy's Resource*, and the famous seven letters by "A Presbyterian," reprinted as *Billy Bluff and Squire Firebrand* (1796). These brilliant satires eventually cost Porter his life. On the outbreak of the rebellion in 1798 he was without fair trial convicted of treason and hanged.

PORTER, JAMES (1808-88). A minister of the Methodist Episcopal Church. He was born at Middleborough, Mass., and joined the New England Conference in 1830. He was elected as one of the agents of the Methodist Book Concern in 1856, and reelected in 1860 and 1864; was secretary of the National Temperance Society in 1868-82; member of the Board of Overseers of Harvard University in 1852-55; trustee of Wesleyan University in 1855-71. He wrote a number of religious works.

PORTER, JANE (1776-1850). An English novelist, born in Durham. She was educated in Edinburgh and lived with her mother and sister till their death at Esher in Surrey, where she passed her last years. In her childhood she was often visited by young Walter Scott, who delighted her with fairy tales and stories of the border. Her first work, *Thaddeus of Warsaw* (1803), was extremely popular and secured her a complimentary letter from Kosciuszko and election into the Teutonic Order of Saint Joachim. In 1810 she published *Scottish*

Chiefs, dealing with the times of Bruce and Wallace. This book was translated into German and Russian, and won European fame. It is by far the best historical romance before Scott. She composed, with her sister Anna Maria, *Tales Round a Winter Hearth* (1826) and *The Field of Forty Footsteps* (1828). Her last novel, *Sir Edward Scavard's Diary* (1831), purporting to be founded on fact, created a great sensation.

PORTER, JOSIAS LESLIE PORTER (1823-89). An English Presbyterian minister and educator, born in Burt Parish, Donegal County, Ireland. Educated in Londonderry and the Universities of Glasgow and Edinburgh, he studied theology under Dr. Chalmers at New College, and was licensed to preach in 1844. He was pastor of a church in Newcastle-on-Tyne from 1846 until 1849, when the Irish Presbyterian Board of Missions sent him to Damascus. For the next ten years he was a missionary to the Jews in Syria and Palestine, was then called to the chair of biblical criticism in the Presbyterian College, Belfast, and became president of Queen's College in the same city in 1879. His publications include: *Five Years in Damascus* (2 vols., 1855); *Murray's Handbook for Travellers in Syria and Palestine* (1858); *The Giant Cities of Bashan* (1865); *Jerusalem, Bethlehem, and Bethany* (1887); and *Through Samaria* (1888).

PORTER, NOAH (1811-92). An American professor of philosophy and a president of Yale University, born in Farmington, Conn., where his father, Rev. Noah Porter, was for more than fifty years minister of the Congregational Church. After graduating at Yale in 1831, he was for a short time rector of the ancient Hopkins Grammar School and subsequently was a tutor in Yale College. He then entered the Congregational ministry, and was successively a pastor in New Milford, Conn. (1836), and in Springfield, Mass. (1843-46). The Clark professorship of metaphysics was then established at Yale, and the young minister became the first incumbent of the chair, which he held from 1846 until his death. In the winter of 1853-54 he studied under Trendelenburg and other professors in the University of Berlin. When Dr. Woolsey resigned the Yale presidency in 1871, Porter was chosen as his successor, and for fifteen years he discharged the difficult duties of that station, lecturing also as a professor, preaching in the college pulpit, and engaging in many literary and scholastic avocations. He resigned the presidential chair in 1886, being followed by Timothy Dwight. His principal publication is a well-known text-book on *The Human Intellect* (1868), which was supplemented by one entitled *The Elements of Moral Science* (1885). He is also widely known as the editor-in-chief of two quarto editions of *Webster's Dictionary* (1864-1900). His minor works included: *Books and Reading* (1870); *Science of Nature vs. Science of Man* (1881); *Science and Sentiment* (1882); and a commemoration of *Bishop Berkeley* (1885). Many of his best essays appeared in periodicals. After his death the tributes to his memory by some of his friends and colleagues were printed in a small volume. One of the sisters of President Porter, Miss SARAH PORTER (1813-1900), established and maintained in Farmington a school for girls, which acquired a national reputation and is still distinguished by the excellent

character of those who have enjoyed its training. A brother, Samuel Porter, spent his life as one of the professors in the Gallaudet College for Deaf Mutes in Washington, and wrote the guide to pronunciation for the edition of Webster's dictionary of 1890.

PORTER, PETER BUEL (1773-1844). An American political leader and soldier; born at Salisbury, Conn. He graduated at Yale in 1791, and after 1795 practiced law first at Canandaigua, N. Y., and then at Black Rock, now part of the city of Buffalo. He was elected to Congress as a Democrat in 1808, and there became a conspicuous advocate of internal improvements. He was reelected in 1810, and for a time was chairman of the Committee on Foreign Relations. At the outbreak of the War of 1812 he resigned his seat in Congress and led a body of New York and Pennsylvania volunteers to the Niagara frontier, where he joined the forces under Gen. Alexander Smyth. Porter soon became disgusted with his superior's management of the expedition, and charged him with being a coward. This led to a bloodless duel on Grand Island. Afterwards, when General Jacob Brown (q.v.) led the Americans into Canada, Porter commanded one of three brigades into which the army was divided, and participated in the battles of Chippewa and Lundy's Lane, and the siege of Fort Erie. In 1815 he again entered Congress, and served until the following year, when he was appointed one of the commissioners under the Treaty of Ghent to determine the northwestern boundary. In 1828 he became Secretary of War in John Quincy Adams's Cabinet, and served until the end of the administration a year later. His interest in internal improvements made him one of the most zealous projectors of the Erie Canal, and he was appointed a member of the first commission.

PORTER, SIR ROBERT KER (1775-1842). An English historical painter and traveler, born in Durham, and a brother of Jane Porter, the novelist. He was a pupil of the Royal Academy. His earlier works include some religious pictures, but he first attracted attention by his panoramic painting, "The Storming of Seringapatam" (1800). Other historical paintings by him are "The Battle of Lodi;" "The Defeat of the French at Devil's Bridge, Mont Saint Gothard, in 1804;" "Agincourt;" and the "Siege of Acre." In 1804 he was appointed battle painter to the Czar of Russia, and did some large decorative works for him in the Admiralty Hall, Saint Petersburg. He accompanied Sir John Moore to Spain in 1808, and wrote *Letters from Portugal and Spain* (1809). From 1826 until 1841 he was consul to Venezuela, and lived at Caracas. He wrote: *Traveling Sketches in Russia and Sweden During the Years 1805-08* (1809); *Travels in Georgia, Persia, Armenia, Ancient Babylon* (1821), his most valuable work; and *Narrative of the Campaign in Russia During 1812* (1813).

PORTER, ROBERT P. (1852—). An American journalist, born at Marham Hall, Norfolk, England. He emigrated to the United States and became one of the original staff of the Chicago *Inter Ocean*, devoting his attention chiefly to economic questions. He made reports for the Tenth Census on wealth, debt, taxation, and transportation in the United States, and in 1882 was appointed a member of the Tariff Commission. The *New York Tribune* and the Philadelphia

Press sent him to Europe to study industrial conditions, and in 1888 he joined Frank Hatton in founding the *New York Press*. From 1889 to 1893 he was superintendent of the Eleventh Census. Later he went to Japan to report on the industries and commerce of that country for the Manufacturers' Association of the United States, and in 1898-99 he acted as special commissioner of the United States to Cuba and Porto Rico. Besides his contributions to the periodical press, he published a number of books, including: *The West in 1880*; *Life of William McKinley* (1896); *Municipal Ownership at Home and Abroad* (1898); and *Industrial Cuba* (1899).

PORTER, THOMAS CONRAD (1822-1901). An American botanist. He was born at Alexander, Pa., was educated at Lafayette College and Princeton Theological Seminary, and preached for five years. In 1849 he was appointed to the chair of natural science in Marshall College, and after serving in the same capacity in Franklin and Marshall College, in 1866 became professor of botany in Lafayette College. Porter retired from active duties in 1897, but remained curator of the botanical collections and dean of the Pardee Scientific School. He wrote several essays on Finnish literature, in which he was deeply interested, and published: *Sketch of the Flora of Pennsylvania* (1872); *Sketch of the Botany of the United States* (1873); *The Flora of Colorado* (with Coulter, 1874); *The Carices of Pennsylvania* (1887); and *The Grasses of Pennsylvania* (1893).

PORTER, WILLIAM DAVID (1809-64). An American naval officer, son of Commodore David Porter and brother of Admiral David D. Porter, born at New Orleans, La. He entered the United States Navy as a midshipman in 1823, rose to the rank of lieutenant in 1833, was placed on the reserved list in 1855, but later was restored to active service with the rank of commander. He saw active service in the Mexican War, organized the United States lighthouse system, and at the outbreak of the Civil War was assigned to service on the Mississippi, where he commanded the iron-clad *Essex*. He took part in the capture of Forts Henry and Donelson; ran the gauntlet of the Confederate batteries from Cairo to New Orleans; fought two engagements with the Confederate ram *Arkansas*, destroying her in the second (August 6, 1862); and later in the same year shelled the batteries at Natchez, Vicksburg, and Port Hudson. He was promoted to the rank of commodore on July 16, 1862.

PORTE SAINT-DENIS, pôrt sã'n'de-né'. An arch on the Boulevard Saint-Denis in Paris, erected from designs by Blondel in 1672 to commemorate the victories of Louis XIV. in Holland and on the Lower Rhine, typified by a dead lion and a river-god of the Rhine at the base of the arch. It is 81 feet in height, 82 in width, and 16 in thickness, with a single archway 50 feet high. With the Porte Saint-Martin, the arch was the scene of revolutionary conflicts in 1830, 1848, and 1871.

PORTE SAINT-MARTIN, sã'n'mãr'tãn'. A triumphal arch at the end of the Boulevard Saint-Martin, Paris, built in 1674 in honor of Louis XIV. It is 57 feet in height and has three archways.

PORTFOLIO, THE. A periodical edited in Philadelphia from 1801 to 1812 by Joseph Den-

nie. Among the contributors were Charles Brockden Brown and John Quincy Adams, whose *Letters from Silesia* appeared in it.

PORT GLASGOW, glã's'kò. A seaport in Renfrewshire, Scotland, on the Clyde, two miles east of Greenock, and 17 miles west-northwest of Glasgow (Map: Scotland, D 4). It was founded in 1668 by the magistrates of Glasgow as a harbor for the ships that belonged to or traded with their city—the Clyde at Glasgow being inconveniently shallow. The deepening of the Clyde, enabling large vessels to ascend to Glasgow, seriously injured its commercial prosperity, but the trade has been for many years improving; the shipping employed is considerable. Port Glasgow is a well-built town. The principal buildings are the town-house and custom-house. It has extensive manufactures of sail-ropes, chain-cables, sugar refineries, foundries, ship-building yards, commodious quays, and an extensive wet dock. The municipal industries include the gas and water works, abattoirs, baths, and wash-houses. A free library and cemetery are maintained. In 1695 the town and a small adjacent district were made into an independent parish; in 1710 it was constituted the principal custom-house on the Clyde, and for a while took the lead of Greenock; in 1775 it was incorporated as a municipality, and by the reform bill of 1832 it was raised to the rank of a Parliamentary burgh. Population, in 1891, 14,624; in 1901, 16,840.

PORT HOPE. A town and port of entry in Durham County, Ontario, Canada; on Lake Ontario and the Grand Trunk Railroad; 63 miles east of Toronto (Map: Ontario, E 4). It is in a beautiful valley, on a hillside. It has water power, a fine harbor, and an active trade in lumber and grain. There are a large fleet of fishing vessels, and manufactories of woolen goods, buttons, leather, wooden ware, steam-engines, machinery, iron castings, etc. Population, in 1891, 5042; in 1901, 4188.

PORTHOS, pôr'tòs'. One of the three guardsmen in Dumas's Musketeer romances. He is gigantic in size, boastful, vain, and indiscreet, but lovable for the honest simplicity of his character.

PORT HUDSON. A small village in Louisiana, on the eastern bank of the Mississippi River, about 135 miles above New Orleans, located at the outward angle of an abrupt bend of the river. In 1862, during the Civil War, the Confederates constructed formidable batteries for a distance of three miles along the high bluffs around Port Hudson, and thus secured effectual control of the river at this point. In the spring of 1863 General Banks, with a large Federal force, proceeded against the position, and after trying ineffectually to turn it on the west, invested it on March 26th, Admiral Farragut having previously, on the night of March 14th-15th, run by the batteries with two vessels of his fleet, the *Hartford* and the *Albatross*, and thus secured the control of the river both above and below Port Hudson. This control, however, was bought at the cost of one vessel, the *Mississippi*, destroyed, and four vessels, which had been forced to turn back, disabled. On March 27th Banks made a determined but unsuccessful assault, and on the following day began a regular siege. On June 14th another unsuccessful assault was made, and then the siege continued until early

in July, when a third assault was planned. On July 7th, however, news of the surrender of Vicksburg to General Grant was received, and on the following day General Gardner, in command of the Confederates, agreed upon terms of surrender, a Federal force taking possession on the 9th. The Federal attacking force numbered altogether about 20,000, though its effective strength never exceeded about 13,000. Of these 707 were killed, 3336 were wounded, and 319 were reported missing. The Confederate garrison numbered about 7500, of whom about 700 were killed or wounded, 500 were reported missing, and 6340 were surrendered. Consult Johnson and Buel (eds.), *Battles and Leaders of the Civil War*, vol. iii. (New York, 1887).

PORT HURON. A city and the county seat of Saint Clair County, Mich., 60 miles northeast of Detroit; on Lake Huron, at the head of the Saint Clair River, and on the Pere Marquette, the Grand Trunk Western, and the Grand Trunk railroads (Map: Michigan, L 6). It also has steamboat connection with Detroit, Chicago, Duluth, and other lake and river ports. The city is built on both sides of the Black River, which here flows into the Saint Clair. A railroad tunnel under the Saint Clair River connects with Sarnia, Canada; it is more than a mile in length, or, including approaches, nearly two miles, and its construction, completed in 1891, cost about \$2,700,000. Port Huron has acquired considerable reputation as a summer resort, owing to its mineral water, but is of greater importance as a manufacturing, shipping, and commercial centre. There are a public library which is to occupy a new \$60,000 structure, the gift of Andrew Carnegie; the county bar library, with 10,000 volumes; a public hospital and home; and several public parks. The notable edifices include the Federal Government building, city hall, county court-house, and the Maccabee Temple, besides a number of business buildings.

Port Huron is a port of entry and controls a large commerce with Canada. Its total foreign trade in 1901 consisted of exports valued at \$9,126,000, and imports, \$2,957,000. It has extensive shipbuilding interests, there being several dry docks and ship yards. Among other industrial establishments are railroad shops of the Grand Trunk, foundries, boiler and engine works, farm machinery works, etc. The Port Huron Engine and Thresher Company at South Port Huron has a capitalization of \$1,000,000. Under a charter of 1899, the government is vested in a mayor, elected biennially, a unicameral council, and administrative boards. The school and cemetery boards are elected by the city council, which also confirms the mayor's nominations of members of the board of assessors and of the police commission. The board of estimates is chosen by popular election. The water-works are owned and operated by the municipality. Settled about 1790 and variously called La Rivière Jarvais, Desmond, and Saint Joseph, Port Huron was organized as a village under its present name in 1849, and was chartered as a city in 1857. Population, in 1890, 13,543; in 1900, 19,158.

PORTIA, pŏr'shĭ-ă. A rich heiress in Shakespeare's *Merchant of Venice*, whose marriage was to be determined by her suitors' choice of one of three caskets. Bassanio, whom she loved, made

the lucky choice, and when his friend Antonio, as his security, fell into the clutches of Shylock, Portia, disguised as Balthazar, a young doctor of law, argued the case successfully in court.

PORTICI, pŏr'tĕ-chĕ. A town in the Province of Naples, Italy, situated on the Bay of Naples, and on the slope of Vesuvius, five miles by rail southeast of Naples (Map: Italy, E 10). Its environs abound in fine villas. The castle built by Charles III, in 1738 contains a school of agriculture. The town has a gymnasium and a lyceum. The inhabitants are engaged in fisheries, and in the weaving of silk. Portici has been several times destroyed by lava, and rebuilt. Population (commune), in 1901, 14,538.

PORTICO (It. *portico*, from Lat. *porticus*, porch, gallery, from *porta*, gate). A covered space with a roof supported by columns open on one or more sides. It is usually attached to an important building, but sometimes detached, as a shady walk. A portico is called tetrastyle, hexastyle, octostyle, and decastyle, according as it has four, six, eight, or ten columns in front. The term is used of the space all around the cella of a Greek peripteral temple, or of that in the front and rear of a temple *in antes*. The similar terms *porch* (q.v.) and *vestibule* (q.v.) are used of less important structures of the same class.

PORTION (Lat. *portio*, share; connected with *pars*, part, *parare*, to prepare, Gk. *επορον*, *eporon*, I prepared). A share of a parent's property or estate, or that of a person standing *in loco parentis*, which is devised or bequeathed by will, or descends to a child, or which is given to him by the parent during the latter's lifetime, and intended to be a final provision for the child, in case of the parent's death. The word portion has no especial technical signification in the law today, except where property is given to children by way of advancement, as a marriage portion, by which the parent anticipates the probable amount the child would receive in case of the parent's death. See **ADVANCEMENT**; **DESCENT**; **INHERITANCE**; **WILL**.

PORT JACKSON SHARK. One of the small cestracion sharks of Australian and South Pacific seas, of which the principal species (*Cestracion Philippi*) is common about the southern shores of Australia, and takes its name from one of the harbors. The egg is very curious, consisting of a conoid leathery case, around which is wound spirally a broad flange, and two horny tendrils serve to attach it to some support. See **CESTRACION**; and Colored Plate of FISHES OF THE PHILIPPINES, accompanying article **PHILIPPINE ISLANDS**.

EGG-CASE OF A CESTRACION SHARK.

PORT JERVIS. A village in Orange County, N. Y., 88 miles northwest of New York City; on the Erie and the New York, Ontario and Western railroads (Map: New York, L 6). It is picturesquely situated at the confluence of the Delaware and Neversink rivers, and at the junction of the boundary lines of New York, New Jersey, and Pennsylvania. A popular summer resort,

the village is of equal importance as the railroad station for a considerable territory, much frequented in summer and widely celebrated for beautiful scenery, many waterfalls contributing to its picturesqueness. Port Jervis has a public library with about 12,000 volumes, Saint Mary's Orphan Asylum, a public hospital, and a soldiers' monument. Among the industrial plants are the Erie Railroad shops, foundries, silver-plating works, and manufactories of glass, shoes, saws, gloves, harness, etc. Population, in 1890, 9327; in 1900, 9385.

PORTLAND. A town (population, in 1900, 3856) in Middlesex County, Conn., on the Connecticut River, opposite Middletown (q.v.).

PORTLAND. A city and the county seat of Jay County, Ind., 49 miles south-southeast of Fort Wayne; on the Salamanie River, and at the junction of the Lake Erie and Western and the Grand Rapids and Indiana railroads (Map: Indiana, D 2). It has a public library, established in 1900, and public buildings of considerable merit. The city is in an agricultural region which possesses a supply of natural gas. There are various manufactures, including butter tubs and cases, spokes, handles, brick, flour, etc. The water-works and electric light plant are owned by the municipality. Population, in 1890, 3725; in 1900, 4798.

PORTLAND. The largest city and commercial metropolis of Maine, and the county seat of Cumberland County, 108 miles north by east of Boston; on Casco Bay, and on the Maine Central, the Boston and Maine, and the Grand Trunk railroads (Map: Maine, C 8). The town is the terminus of several lines of transatlantic steamships, besides coastwise lines. Portland possesses a site of great natural beauty on a peninsula extending into Casco Bay, which is dotted with numerous picturesquely wooded islands. Many of these islands are popular summer resorts. Portland itself is of considerable reputation as a resort, and the noted watering places of the vicinity are easily accessible from the city. The harbor is spacious, deep, and secure. Its defenses, which have been recently improved to a considerable extent, now include Fort Preble (q.v.), Fort Williams on Portland Head, Fort Levett on Cushing's Island, and Fort McKinley on Great Diamond Island. Forts Scammel and Gorges, formerly strongly equipped, now serve but to enhance the general beauty of the harbor. A marginal railway extends along the water front of the business portion of the city.

Portland has an area of more than 18 square miles. It is regularly laid out for the most part, and, from the fine shade trees that line its streets, it has acquired the name 'Forest City.' There are 113 acres in the public park system, which includes Deering Oaks, Lincoln Park, Fort Allen and Fort Sumner parks, Monument Square with a soldiers' monument, and the Eastern and Western Promenades. The observatory on Munjoy's Hill commands a superb view of the city and its waters, and of the mountains some distance inland. On the southern slope of the hill is the Eastern Cemetery, the burial place of a number of persons noted in history. Among the prominent structures in Portland are the city hall, custom house, post-office, United States Marine Hospital, Maine General Hospital, the public library (47,500 volumes), which is the home also of the

Maine Historical Society, founded in 1822, with a library of 13,500 volumes, the building of the Portland Society of Natural History, and the cathedrals of Saint Luke (Protestant Episcopal) and the Immaculate Conception (Roman Catholic). Several old colonial mansions, the Longfellow House, Wadsworth Mansion, and the Preble House are of historic interest. Portland has the Maine Medical School, connected with Bowdoin College; the Maine Eye and Ear Infirmary, and a number of other charitable institutions; and several libraries besides those mentioned above. A bronze statue of Longfellow is one of the features of the city.

From colonial times Portland has been noted for commercial interests, its trade, with the West Indies especially in earlier days, being one of its important sources of wealth. The city is still of greater importance for its commerce than for its industrial enterprises, exporting extensively grain, apples, and live stock. The foreign trade of the customs district of Portland and Falmouth in 1901 consisted of exports aggregating in value \$12,416,793, and imports, \$633,114. In recent years the exports have increased substantially, while the imports show a tendency to decline. According to the census of 1900, there were in Portland manufactures having an invested capital of \$6,991,000, the products being valued at \$11,440,000. The most important establishments include foundries and machine shops, railroad car and machine shops, manufactories of lumber and lumber products, boot and shoe factories, clothing factories, furniture factories, confectionery factories, flavoring extract works, fruit, vegetable, and fish canneries, carriage and wagon shops, flour and grist mills, marble works, etc.

Under a revised charter of 1900, the government is vested in a mayor, elected annually, a bicameral council, and administrative officials. The commissioner of public works, city marshal and deputies, and the board of health are appointed by the mayor, who also nominates, with the consent of the board of aldermen, members of the police force. The city treasurer, city clerk, auditor, messenger, and subordinate officers are elected by the city council. The school board is chosen by popular vote. It elects the superintendent of schools.

Population, in 1800, 3822; in 1850, 20,815; in 1870, 31,413; in 1890, 36,425; in 1900, 50,145.

Portland, the Indian Machigonne, was settled by two Englishmen, George Cleves and Richard Tucker, in 1632, and until 1658, when the name was changed to Falmouth, was known as Casco Neck. In 1676 it was completely destroyed by the Indians, and all its inhabitants were either killed or carried into captivity. In 1690, settlers again having come in some numbers, the place was once more destroyed and all its inhabitants massacred or captured. It was resettled in 1715, was bombarded and burned in 1775 by a British fleet, was incorporated as a town under its present name in 1786, and was chartered as a city in 1832. On July 4, 1866, a fire broke out and consumed 1500 buildings in the centre of the city, with a loss of about \$10,000,000. Longfellow, N. P. Willis, Commodore Preble, Neal Dow, and Thomas B. Reed were natives of Portland. Consult: Neal, *Portland* (Portland, 1874); Willis, *History of Portland* (2d ed., Portland, 1865); and a sketch in Powell's *Historic Towns of New England* (New York, 1898).

PORTLAND. The largest city in Oregon and the county seat of Multnomah County, and an important commercial and industrial centre. Situated on both sides of the Willamette River, 12 miles above its confluence with the Columbia River and about 120 miles from the Pacific, Portland is distant 52 miles north-northeast of the State capital, Salem, and 774 miles north by east of San Francisco (Map: Oregon, G 7). It is built on slopes rising gradually from the river banks into wooded hills, with tall mountains in the distance—a site of great natural beauty that is enhanced by the fine trees and lawns of the city. In the vicinity are numerous picturesque waterfalls; and Portland Heights, in the western part of the city, command a superb view of the distant mountains and the valleys of the Columbia and the Willamette.

The city has an area of 40 square miles and is well laid out. About two-thirds of its total street mileage is paved, a great proportion of this distance (122 miles) being laid with macadam and gravel. There are more than 205 acres in the public park system. Among the noteworthy structures in Portland are the city hall, occupying an entire block, the post-office, court-house, Portland library, high school, Chamber of Commerce, Hotel Portland, the Union Railroad Depot, Industrial Exposition building, the office of the *Oregonian*, the tallest edifice in the city, the Dekum, Worcester, Meier, and Frank buildings, and the Marquam Block. The law and medical departments of the State University are in Portland, and there are several well-known preparatory schools. The Portland Library, which has been recently opened to the public, contains 27,000 volumes. The city has a number of charitable institutions, of which Saint Vincent's and Good Samaritan hospitals are the best known. Other features of interest are two handsome fountains, and the four bridges across the Willamette River, two of which are fine steel structures.

Portland has exceptional advantages for a commercial centre. Situated at the head of ocean navigation, on the waterway formed by the Columbia and Willamette, it possesses a harbor commodious and accessible for the largest ships. Its port is the terminus of several ocean and coastwise steamship lines; and in the large Union Depot four great railroad systems terminate: the Great Northern, the Northern Pacific, the Union Pacific (the Oregon Railway and Navigation Company), and the Southern Pacific. The tributary region, rich in timber and in agricultural and mineral resources, is one of the most productive in the United States, though but partly developed. In 1901 the foreign commerce of the port was valued at nearly \$12,000,000, the exports, principally grain, flour, and lumber, constituting a very large proportion of this total. The trade is carried on chiefly with Great Britain and its possessions. Portland is highly important also as a distributing point, its wholesale and jobbing trade in 1902 amounting to about \$155,000,000. Its industrial interests, too, are extensive and varied, representing, according to the census of 1900, an invested capital of \$13,332,000, and having a production valued at \$23,451,000. The manufactures are favored by the power obtained from the Willamette Falls at Oregon City (q.v.), 12 miles distant. This power, electrically transmitted to Portland, is utilized also for lighting and for the operation of street

railways. The leading manufactures include lumber and timber products, flouring and grist-mill products, and the output of slaughtering and meat-packing plants. There are also bag factories, creameries, clothing factories, establishments for the roasting and grinding of coffee and spices, foundries and machine shops, including stove foundries, iron works, manufactories of fur goods, furniture factories, paint works, saddlery and harness factories, ship and boat building yards, soap and candle works, fruit drying and canning establishments, and breweries. A large dry dock is in course of construction (March, 1903).

The government is vested in a mayor, elected every two years, and a unicameral council, and in administrative officials, the majority of whom are appointed by the mayor, or nominated by him with the consent of the council. The school board, however, is chosen by popular vote. Portland spends annually in maintenance and operation about \$960,000; the principal items of expenditure being: for interest on debt, \$305,000; for schools, \$270,000; for the fire department, \$80,000; for the police department, \$55,000; for the care of streets, \$50,000; for municipal lighting, \$50,000. The water-works, which were built in 1857, are owned by the municipality, having been acquired by the city in 1886. The cost of their construction has been over \$4,000,000. The net debt of the city in 1902 was \$5,637,000; the assessed valuation of property, \$43,360,000.

Portland was founded in 1845 by F. W. Pettygrove and A. L. Lovejoy. It was named by the former in honor of Portland, Maine, and was chartered as a city in 1851. It suffered severely from fire in 1872 and 1873, the loss in the latter year having been about \$1,350,000. Portland has had an exceedingly rapid growth, as indicated by the following figures of population: 1850, 821; 1860, 2874; 1870, 8293; 1880, 17,577; 1890, 46,385; 1900, 90,426. The total in 1900 included 25,876 persons of foreign birth, and a colored population of 9812, 775 being of negro descent. Consult a chapter on Portland in Powell's *Historic Towns of the Western States* (New York, 1901).

PORTLAND, DUKE OF. An English title of nobility, borne by the Cavendish-Bentinck family since 1716, when it was conferred upon the heir of William Bentinck (1649-1709), first Earl of Portland, a Dutch general, the friend and adviser of William of Orange, whom he accompanied to England. The more distinguished members of the family have been Lord William Cavendish Bentinck, second son of the third Duke, and Lord William George Frederick Cavendish Bentinck, third son of the fourth Duke. See BENTINCK.

PORTLAND, ISLE OF. A rocky peninsula projecting into the English Channel from the shore of Dorsetshire, 17 miles west of Saint Alban's Head (Map: England, D 6). It is connected with the mainland by Chesil Bank, a ridge of loose shingle. It is famous for its stone, of which some of the finest buildings in London are built, among them Saint Paul's Cathedral. It contains a number of historic castles, such as Portland Castle, built by Henry VIII. in 1520; Pennsylvania Castle, erected by a grandson of William Penn; and Bow and Arrow Castle, supposed to have been built by William Rufus. The peninsula is strongly fortified, and there is an

immense convict prison with accommodations for 1500 prisoners, built in 1848. The Portland Breakwater (see BREAKWATER) affords a safe harbor of refuge. Population, in 1891, 9443; in 1901, 15,202.

PORTLAND CANAL. A long and narrow fiord indenting the west coast of North America opposite Queen Charlotte Islands (Map: Alaska, J 4). It extends northeastward for about 80 miles inland, is very deep, and inclosed by precipitous cliffs and by mountains from 3000 to 6000 feet high. It forms the extreme southern boundary of Alaska, which it separates from British Columbia.

PORTLAND CEMENT. See CEMENT.

PORTLAND VASE. A beautiful vase of transparent dark-blue glass, coated with opaque white glass, which has been cut away so as to resemble a cameo. The scenes on the vase have as yet found no satisfactory explanation. It was discovered in a large marble sarcophagus, of the third century of our era, which was found at Rome about the middle of the sixteenth century, and had contained the ashes of the dead. Its style, however, shows that it belongs to an earlier period, probably the first century B.C. It was at first deposited in the Barberini Palace in Rome, but was (1770) purchased by Sir William Hamilton, and finally by the Duchess of Portland. In 1810 the Duke of Portland lent it to the British Museum. In 1845 an insane visitor to the museum dashed it to pieces with a stone, but the fragments were so skillfully united that the damage is scarcely perceptible. It was copied by Wedgwood (q.v.) in his new style of pottery. Consult: J. Wedgwood, *The Portland Vase*, edited by Windus (London, 1845); Friedrichs-Wolters, *Die Gipsabgüsse antiker Bildwerke*, Nos. 2008, 2009 (Berlin, 1885).

PORT LOUIS, 𐌗𐌚'is or 𐌗𐌚'é. The capital and principal port of the British colony of Mauritius, situated on an inlet on the northwest coast (Map: Africa, K 7). It is well built, with straight, though narrow, streets. Its most notable buildings and institutions are the Roman Catholic and Protestant cathedrals, a library, a theatre, an observatory, and a botanical garden. Its harbor is capacious and defended by forts. By far the larger part of the trade of Mauritius passes through Port Louis, and a railway line connects the city with the southern and eastern parts of the island. The population is decreasing, and the Indian and Chinese elements are becoming prominent at the expense of the Europeans, though the latter still include more than half of the inhabitants. Population, in 1891, 62,046; in 1901, 52,740.

PORT MAHÓN, má-hón', or simply MAHÓN. The chief town of the island of Minorca, and one of the principal seaports of Spain, situated at the head of a bay on the east coast of the island (Map: Spain, H 3). It is a pleasant town with straight and regular streets, and many of its houses are built in the English style. The most notable buildings are the consistorial palace, the civil and military hospital, the fine Coliseum Theatre, and a church containing a magnificent organ. The town has a high school, a public library, and a museum. There are some manufactures of cotton textiles and leather goods, but

the chief importance of the town is derived from its fine harbor, which is one of the best in the Mediterranean. It has a large anchoring space, and is provided with a long quay accessible for the largest ships. Its situation makes it a convenient port of call between France and Algiers; it is also an important naval station, and its fortifications have recently been strengthened. Its trade amounts to over \$1,000,000 annually; its chief exports are live stock and agricultural products. Population, in 1887, 18,445; in 1900, 17,975. Mahón is supposed to have been founded by the Carthaginian general Mago, and its Roman name was *Portus Magonis*. It was in the possession of the English during the greater part of the eighteenth century.

PORT NATAL, ná-tál'. The seaport of Durban (q.v.) in South Africa.

PORTO ALEGRE, pôr'tó á-lá'gre. The capital of the State of Rio Grande do Sul, Brazil, situated at the mouth of the Jaenby River at the northern extremity of the Lagoa dos Patos (Map: Brazil, K 7). It is one of the cleanest and best built cities of Brazil, and has straight streets, and several large squares on one of which, the Praça de Dom Pedro, stand the Government building and the house of the Legislature. Other notable buildings are the cathedral, the theatre of Dom Pedro, and the custom-house. The city has a high school, a normal school, a theological seminary, and a school of engineering. It is the chief outlet for the products of the northern part of the State, and is connected with the interior by railroad. Its trade, however, is endangered by the rapid sanding up of the Rio Grande, the outlet of the lagoon, and extensive engineering works will be necessary to make the harbor of the city accessible to large vessels. The export trade, which is chiefly with Germany, the United States, and Great Britain, amounts to about \$3,000,000 annually, the chief articles exported being beef, salt pork, lard, hides, and flour. Near the city is a coal mine yielding over 16,000 tons annually. Population, in 1890, 52,421; in 1900 (estimated), 100,000.

PORTOBELLO. A popular watering-place on the Firth of Forth, three miles east of Edinburgh, Scotland (Map: Scotland, E 4). Its manufacturing establishments comprise potteries and earthenware, bottle, brick, and paper works, etc., but it is chiefly noted as a favorite summer resort for sea-bathing. It has a commodious town hall, a marine promenade, and a spacious amusement pavilion. Population, in 1891, 8181; in 1901, 9200.

PORTO EMPEDOCLE, pôr'tó òm-pá'dó-klá. A city on the southern coast of Sicily, six miles by rail southwest of Girgenti (q.v.), of which it is the seaport. It was formerly called Molo di Girgenti. The merchants of Girgenti have here great storehouses hewn in the rock for sulphur and for grain. The harbor is 26 feet deep, has a lighthouse, and is protected by a mole over a mile long. Population (commune), in 1901, 11,529.

PORTO FERRAJÓ, fôr-rä'yó. The chief town of the island of Elba (q.v.).

PORT OF SPAIN. The capital of the British West Indian island of Trinidad, situated on the western coast of the island (Map: West Indies, R 9). It is considered one of the finest towns in

the West Indies. There are a college and a fine botanical garden. Within the latter stands the magnificent residence of the Governor, and there are many other handsome buildings in the suburbs. The harbor can accommodate vessels of the heaviest draught. The port is the principal place of shipment for the products of the Orinoco region. Population, in 1891, 33,782; in 1901, 54,100.

PORTO MAGGIORE, pŏr'tŏ mäd-jŏ'rä. A town in the Province of Ferrara, Italy, situated on an island in the lagoons of the Commachio, about 15 miles by rail southeast of Ferrara (Map: Italy, F 3). The products are grain, beet root, and rope, and there is a trade in cattle and fish. Population (commune), in 1901, 20,162.

PORTO MAURIZIO, mou-rĕt'sĕ-ŏ. The capital of the Province of Porto Maurizio, Italy, situated on a promontory projecting into the Ligurian Sea, 58 miles by rail southwest of Genoa (Map: Italy, C 4). It is a winter resort, has a fine church, a library, a theatre, a technical institute, and a school of navigation. There is a shipping trade in olive oil, agricultural produce, and fish. Population (commune), in 1901, 7141.

PORTO NOVO, nŏv'ŏ. The capital of the French West African colony of Dahomey, situated a short distance from the Gulf of Guinea and connected by a lagoon with the seaport of Kotonu. It trades in palm oil and kernels. Porto Novo was the capital of the negro State of the same name, incorporated in 1893, with the colony of Dahomey. Population, estimated at 50,000.

PORTO NOVO. A seaport town of Madras, British India, situated on the Coromandel Coast, 15 miles south of Cuddalore (Map: India, D 6). Both the Portuguese and the Dutch had a factory here in the seventeenth century. Porto Novo is celebrated for its iron foundry, which supplied much of the material for the Madras railways, but is chiefly famous for the battle fought here on July 1, 1781, when Sir Eyre Coote, retreating after his defeat at Chidambaram, was again attacked by Hyder Ali with an overwhelming force, and by adroit strategy routed his assailants with great loss. Population of Porto Novo, called by the natives *Parangipetta*, about 14,100.

PORTO RICAN EXPEDITION, SOCIETY OF THE. A patriotic society projected at Caguas, Porto Rico, October 11, 1898, and organized at Columbus, Ohio, June 5, 1900. There are three classes of members: (1) Active members, who as officers or enlisted men in any branch of the United States service with the Porto Rican expedition were on the island before or on October 18, 1900, the date of the raising of the American flag over the Capitol at San Juan; (2) associate members, who are soldiers or sailors of good reputation belonging to organizations or vessels which composed the expedition, but who were detained in the United States by sickness or disability, or on detached service, as well as members of the Red Cross Society, volunteer nurses, etc., who served with the army in Porto Rico; and (3) honorary members. The membership, which is about 500, is distributed among departments, as follows: Ohio, Pennsylvania, New York, Massachusetts, Illinois, Kentucky, Wisconsin, and District of Columbia.

PORTO RICO, pŏr'tŏ rĕ'kŏ (Sp. *Puerto Rico*, Rich Port). An island of the West Indies, the most easterly of the Great Antilles, the smallest among them, but the first in density of population. It lies between latitudes 17° 50' and 18° 30' N. and longitudes 65° 30' and 67° 15' W., is nearly 1200 miles from the equator, 1000 miles from Havana and Key West, 1500 from New York, and 3000 from Cadiz, Spain. It is roughly rectangular in shape, nearly three times as long as it is broad, the greater axis extending almost directly east and west. Length, about 100 miles; area, 3676 square miles, or about three times that of Rhode Island. It contrasts sharply with the other Great Antilles in appearance, for its mountains are lower and on the whole it presents a hilly and picturesque rather than a mountainous aspect. A number of islands lie off the coast, but only three are of importance, Mona in the west and Vieques and Culebra in the east.

TOPOGRAPHY. The coast line is about 360 miles in length, with comparatively few important indentations. Around the whole periphery of the island are numerous fluvial valleys disposed at right angles to the coast. The coastal plains comprise about one-tenth of the area. There are a few headlands along the coasts, which, however, are usually low, especially on the southern side. They also lack the fringing keys such as border Cuba.

Passing across the island from east to west, a little south of the middle, is a broken irregular range of hills or low mountains which toward the eastern end trend to the northeast and culminate in the peak of El Yunque, 3609 feet high. Elsewhere the range is from 2000 to 3000 feet in altitude, with a few summits over 3000 feet and passes a little below 2000 feet. The range is known by various names in different parts of the island, Cordillera Central, Sierra de Cayey, and Sierra de Luquilla in the northeast. From this backbone of the island the land slopes north and south, its steep hilly surface deeply cut by streams. Toward the coast it becomes more nearly level until it spreads away to the sea edge in broad, level, alluvial, fertile plains.

HYDROGRAPHY. The central range of mountains forms the water parting of the island, most of the streams rising on its slopes and flowing northward or southward. Those flowing north have the longer courses and gentler slopes, and some of them are navigable for several miles by small boats and flat boats. The southern streams are not useful for navigation, and nearly all the Porto Rican rivers have troublesome bars at their mouths. The principal rivers are the Loiza or Rio Grande, Bayamon, Morovis, Plata, Cibueo, Manati, Arecibo, and Blanco, which flow to the north coast; the Culebrinas, Anaseo, Guanajibo, and Mayaguez, flowing to the west; the Portugés, Jacaguas, Coamo, and Guamani, to the south; and the Humacao, Naguabo, and Fajardo to the east. The rivers give great facilities for water and steam power and irrigation. One reason why Porto Rico is more healthful than the other Antilles is because the streams afford such excellent drainage that there is an almost total absence of stagnant water. There are eight small lakes on the north, east, and south slopes of the island.

CLIMATE. Though the island is in the tropics, it is also under the régime of the persistent

PORTO RICO.

northeast trade winds, which temper the heat. The topography causes local climatic differences and the natives even speak of the 'rigors of winter' in the upper altitudes. The annual range of temperature is from 100°, which is very rare, to 50°, which is sometimes reported among the mountains. The mean annual temperature at San Juan, on the north coast, ranges from 78° to 82°. The climate would seldom be oppressive if it were not for the constant high humidity. Rain falls almost daily, the annual precipitation at San Juan averaging 60 inches. Nearly two-thirds of the precipitation falls in the summer and autumn. The rain increases from San Juan eastward, is heaviest on the highlands, which arrest much of the precipitation, so that the south slope of the island is much drier, and in some regions irrigation is necessary for the cultivation of crops. Among the causes that interfere with agricultural prosperity are hurricanes. Between 1515 and 1899 eighteen very destructive hurricanes occurred. The especially disastrous hurricane which visited the island on Aug. 8, 1899, caused large loss of life and immense damage to crops, and 250,000 persons were compelled for some time to depend upon the Government for food.

Near the ocean the soil is quite sandy; it becomes loamy as it extends inland, and gradually changes from a sandy to a clay loam on ascending the lower foot hills. The soil of most of the coastal plains is rich alluvium, which gradually merges into the clay loam of the hills. The ferruginous clay of the mountains is a source of abundant supply of plant food.

FLORA. The island is famous for the number and size of its trees. The fine forests of the higher region resemble those of other islands of the West Indies, but are almost destitute of parasitic vegetation excepting orchids. The trees include several species of palms, a beautiful tilandsia whose wood, called *sabrino*, is used for timber, a hard wood called *ausubo*, which is much used for the frames of buildings, hard and soft Spanish cedar and ebony, the West Indian sandalwood, the laurel, willow, and many woods useful for construction. About thirty medicinal plants are utilized, twelve plants for condiments, twelve for dyes and tanning, and eight for resins, and many large trees produce edible fruits. The pastures are covered with nutritious grasses.

FAUNA. The native fauna is very limited, there being no large mammals excepting those which are domesticated. There are no noxious reptiles and few insect pests. Flamingos and other water birds abound along the coast; and in the mountains are many birds, including doves. Fish of valuable species are abundant both in the fresh water and along the coasts. The gigantic tortoise is closely allied to the famous large tortoise of the Galápagos Islands.

GEOLOGY AND MINERAL RESOURCES. The island has three geological elements: (1) A central system of deeply ribbed and corrugated mountains with V-shaped gorges and ridges; (2) lower hills along the north and south coasts; (3) coastal plains with alluvial soil extending from the foot of the central mountains across the line of foothills to the sea. The central mountains are formed of volcanic ejecta—tuffs and conglomerates—with occasional dikes and interbedded bluish limestone, which, however, is of rare occurrence. These mountain rocks, which are of

Cretaceous and possibly early Eocene age, are entirely decayed at the surface, breaking down into a red clay resembling that of the southern Appalachians. The foothills are all of later Tertiary and Pleistocene age, and are composed entirely of rocks of sea origin, consisting of the peculiar type of tropical white limestones of a chalky, marly, and shelly nature. The island abounds in clay suitable for ordinary brick and earthenware. Good building sand is found, but little of it is sufficiently pure for glass-making. The white limestones of the coastal plain supply excellent lime. The building stones are volcanic boulders and limestone. Houses made of boulders have a picturesque and rubbled appearance. Those constructed of limestone are always stuccoed, and the most elaborate buildings are made of limestone, including all of the public buildings and fortresses. Beautiful marble of great hardness is quarried near Juana Diaz, but as yet is used only for structural purposes, such as bridge piers. Sandstone is comparatively rare, but fine flagstone is abundant all over the island. Gypsum is used extensively for stucco, plaster, and fertilizer. A large area of the southern coast abounds in phosphates, but the industry has developed only on Mona Island, off the west end of Porto Rico, where it is estimated that there are nearly 500,000 tons of guano and phosphates in the caves already explored. Only about 50,000 tons of these fertilizers have as yet been extracted. Near Ponce and elsewhere numerous caves are filled with rich deposits of guano, which are now being worked. Lignite is found, but the fuel resources have not yet been investigated. Sufficient salt for the needs of the island may easily be obtained from many lagoons near the sea by natural evaporation of the brine. The principal deposits are the salines of Coama, Guanica, and Sierra de Piñones de Cabo Rojo. Invalids resort to a number of mineral springs, chiefly at Ponce and Coamo.

No mining of metals is yet carried on. Those most frequently found are gold, carbonate and sulphide of copper, and magnetic oxide of iron. Since the discovery of the island, gold has been washed in small quantities from many rivers, especially in the north and east. Experience has shown that the placer deposits are not rich or extensive. At one place north of Juncos there is a large deposit of magnetic iron ore.

AGRICULTURE. Sixty-three per cent. of the population is engaged in agriculture. Although the soil is very fertile, the methods of cultivation are crude and primitive. Modern agricultural implements, since the advent of the Americans, are slowly finding their way into the rural districts. The area of the island is 2,347,520 acres, of which only about 20 per cent. is cultivated, 51 per cent. being devoted to pasture, 7 per cent. waste land, and 22 per cent. covered with roads, streams, towns, and forests. Of the cultivated lands, 61,556 acres are in sugar cane, 122,358 acres in coffee, 4222 acres in tobacco, 93,508 in beans, rice, and maize, and 17,176 in fruits. The principal crops are sugar, coffee, and tobacco, whose mean annual production and value for the four years 1898-1901 were: Sugar, 67,582 tons, worth \$4,520,740; coffee, 14,580 tons, worth \$2,916,000; tobacco, 3342 tons, worth \$367,620. Cane-sugar farming requires large capital, and in Porto Rico, where it is at present the most valuable crop, most of the planting is on large estates, with central mills for grinding. Comparatively

few plantations are as yet provided with the best steam machinery for making sugar, and nearly one-half of the cane-grinding machines are worked by oxen. Sugar-growing is chiefly confined to the coastal plain, only a little above the level of the sea, where the lands are alluvial and very rich.

The best coffee is produced between 600 and 2400 feet above the sea. It is grown, therefore, chiefly among the mountains. It has an excellent reputation in over-sea markets. Porto Rican tobacco is also in excellent repute in the markets of Europe and America. The district of Cayey, for the quality of tobacco produced, is in Porto Rico what the Vuelta Abajo is in Cuba. All tropical fruits flourish, and the cultivation of fruits is now receiving great attention. Oranges, pineapples, coconuts, and bananas are increasing in supply. All kinds of vegetables are produced in abundance where care and industry are given to their cultivation. Cotton grows well, but in recent years practically none has been raised. The home market absorbs the entire crop of maize. Nearly all the rice is of the upland variety. More than 1,000,000 acres of pasture land are devoted to or are suitable for stock-feeding. Over 100,000 acres are in very fine grass, much of it of the malojilla variety, which is very productive and highly nutritious. There were in the island, in 1897, 67,751 horses, 4467 mules, 303,612 cattle, and 13,411 swine. Cattle are exported chiefly to the Windward Islands and are of excellent breed. The cows, oxen, and beef cattle compare favorably with those of any other part of America. They are descended from a large number of fine cattle taken to Porto Rico from the Cape Verde Islands about 1840. The horses are small, agile, hardy, work well in harness or under the saddle, and have remarkable endurance.

The small area of the island and its dense population naturally increase the value of land, which is held at high prices. The best sugar lands are valued at \$150 an acre; tobacco lands, from \$60 to \$75 an acre; fruit lands, from \$40 to \$50 an acre; pasture lands, from \$15 to \$20 an acre; and hill lands, suitable for coffee, from \$10 to \$15 an acre. Land along the sandy seashores, where only coconuts are grown, may be purchased for \$5 to \$10 an acre. About 100,000 acres of public land passed to the United States under the Treaty of Paris. Some of it is valuable for agriculture or timber, and other tracts near cities and towns are available for their growth.

MANUFACTURES. Manufacturing industries are chiefly confined to sugar, tobacco, rum, and straw hats. Sugar-making, the largest mills being controlled by American capital, is the leading industry. A small refinery near San Juan rectifies crude petroleum. There are a few tanneries and foundries, and at San Juan matches, ice, soap, and some leather goods are made. Straw-hat braiding has received a large impetus, as the United States is buying many of these products.

COMMERCE. Since the change in the control of the island, the United States has become the chief source of supplies and largest market for native products. The trade with over-sea lands, particularly with the United States, is steadily improving. The imports from the United States in the fiscal year ending July, 1902, were \$10,719,-

444; the imports from foreign lands were \$2,429,004; total imports, \$13,148,448. Flour and bread-stuffs from the United States were bought to the amount of \$1,090,079; rice, to the amount of \$1,803,065; cotton cloths, \$2,060,826; provisions, \$1,336,646; wood manufactures, \$560,081; fish, \$300,703; leather goods, \$234,331; vegetables, \$231,450; mineral oils, \$144,512; paper goods, \$110,222; chemicals and drugs, \$135,896; and malt liquors, \$118,450. The chief imports from foreign countries were codfish from Newfoundland and Canada, \$424,953; preserved meats, \$158,046; soap, \$133,962; besides olive oil, machinery, rice, vegetables, wine, and sawed lumber. The exports to the United States were \$8,297,420; and to foreign countries, \$4,592,505; total exports, \$12,889,925. The chief sales to the United States were: Sugar, \$5,890,087; cigars and cigarettes, \$1,570,938; molasses, \$322,636; straw hats, \$204,555; hides and skins, \$67,888; oranges, \$51,364; and coffee, \$29,188. The principal exports to foreign countries were: Coffee, \$3,168,664; cattle, \$418,268; molasses, \$256,461; and hides and skins, \$13,656. The larger part of the foreign trade is with Spain.

The United States Congress provided in the act creating civil government, approved April 12th, 1900, that when the Legislative Assembly should raise sufficient funds by local taxation to pay the expenses of the government, all tariffs on merchandise passing between the island and the United States should cease. The revenue act passed at the first session of the Legislative Assembly was so successful in operation that the revenues for the fiscal year ending July 1, 1901, surpassed the expenses of government; and on July 25th of that year President McKinley proclaimed free trade between the United States and Porto Rico.

TRANSPORTATION AND COMMUNICATION. In November, December, and January the north coast ports are difficult of access on account of north winds, and from June to November southerly winds endanger the anchorages on the southern coast. The principal ports are San Juan, on the north; Fajardo and Ensenada Honda, on the east; Playa, the port of Ponce, and Guanica, on the south; and Puerto Real de Cabo Rojo, on the west. The island of Vieques has several commodious harbors. A line of steamers plies regularly between New York and Porto Rico. There are also more or less regular communications with Spain, England, South America, and the other West Indies. In the fiscal year 1901-02, 222 American and 295 foreign vessels entered the harbors. Not many years ago the bull cart and pack animal were almost the sole means of inland transportation. These primitive appliances are being supplanted by railroads. The American Railroad Company, which purchased the existing railroad of the French company, is now operating 131 miles of narrow-gauge road along the north coast, and proposes to make it a part of a belt railroad around the island. In 1901 the road carried 149,597 passengers, 76,912 tons of freight, its gross receipts being \$197,000, and the operating expenses \$170,000. Other narrow-gauge railways extend from Cataño, near San Juan, six miles to Bayamon, and from Mayaguez to Añasco, 10.5 miles. There are electric trolley roads in San Juan and Ponce. The Government in four years has completed 87 miles of fine wagon roads at a cost of about \$8000 per

kilometer (.62 of a mile); about 177 miles of good roads were in use when the United States acquired the island. In July, 1902, there were 32 telegraph offices and 600 miles of wire. Two submarine cables connect the island with the outside world, one via Saint Thomas and the other through Kingston, Jamaica.

BANKING. There is only one bank, the Spanish Bank, situated at San Juan, with branches at the principal towns of the island. It has power to issue notes to the extent of three times the amount of its capital, but the present policy of the bank is to curtail the issue of banknotes.

FINANCE. The insular revenues are derived from the customs, internal revenue taxes, postal receipts, a few minor sources of income, and trust funds. The trust funds are derived from revenues collected in the United States on importations from Porto Rico and placed at the disposal of the President to be used for the government and benefit of Porto Rico, for the aid and relief of its people, and for public education, public works, and other public purposes. The total receipts for the year ending June 30, 1902, were \$4,472,192.63. There were derived from customs \$848,258.30; internal revenue, \$1,497,802.63; miscellaneous, \$52,525.22; trust funds, \$1,478,682.08; balance on hand at close of business June 30, 1901, \$563,650.54. The expenditures were: legislative, \$51,430.14; executive, \$1,655,779.23; judicial, \$200,104.66; other disbursements from insular revenues, \$292,128.37; disbursements from trust fund, \$914,281.37; total expenditures, \$3,113,723.77; balance on hand at close of business June 30, 1902, \$1,358,468.86. The municipalities are supported chiefly from taxes on real estate.

WEIGHTS, MEASURES, AND MONEY. Mexican money was current until the end of 1895, when a five-peseta piece was coined and put in circulation. The peseta has now been superseded by the American dollar. The metric system of weights and measures is in use.

POPULATION. The population by the census of 1899 was 953,243, or 264 to a square mile, a density of population about the same as that of New Jersey. The people live chiefly in the rural districts. There are no large cities, the only cities exceeding 25,000 inhabitants being San Juan (32,048) and Ponce (27,952). Mayaguez had a population of 15,187, and Arecibo 8008. There are 8731 more females than males in the island. The census divides the inhabitants into whites, numbering 589,426, or 61.8 per cent.; and colored, numbering 363,817. The classification 'colored' includes a very few Chinese and many persons of mixed white and negro blood, as well as the pure negroes. More than three-fifths of the population are pure white, and nearly two-fifths are partly or entirely negroes. About 84 per cent. of the total colored were returned as mixed blood. Of the whites of Porto Rican birth, 21 years of age and upward, 35,397 could read, and of the colored, 12,576. Under the educational qualification, therefore, the number entitled to vote would be 49,973. About 200,000 persons are employed as laborers in the fields. Though small in weight and stature, their bodies are all bone and sinew, and they have great powers of endurance. The average daily wage of the farm hand is about 35 cents, and the scale of wages can hardly be increased until there is a general rise in the price

of agricultural products. In 1897 the wealth of the island was estimated at \$150,000,000, but the municipal and private mortgage indebtedness was about one-third of the total wealth, and rates of interest are very high.

IMMIGRATION. The immigration laws and regulations of the United States apply to Porto Rico. Of the 1908 persons arriving at San Juan in 1902, 725 were cabin passengers, three-fourths of whom were Spaniards who left the island at the time of the American occupation and are now returning. Most of the immigrants are from the other West Indies, Spain, and South America, a large part being Porto Ricans who left at the time of the American occupation.

EDUCATION. On February 21, 1902, there were 876 schools, with 41,642 pupils and 934 teachers. The number of schools has increased over 80 per cent. since the American occupation. The Porto Ricans predominate among the teachers, 837 teachers being natives of the island. More than half the schools are ungraded rural schools. In the 345 graded schools much attention is given to the study of English. There are also a normal school for the training of teachers and a high school at San Juan. Two-thirds of the text books are in the Spanish language, although wherever practicable the pupils are required to use the English text.

RELIGION. The predominant religion is Roman Catholic, but all faiths have complete toleration. A Protestant church is maintained in Ponce, and a few others in smaller towns. The bishopric of Porto Rico, founded in 1504, was the first to be established in the New World.

GOVERNMENT. After the cession of Porto Rico to the United States the island was governed chiefly by the military authorities under the direction of the President of the United States until May 1, 1900, when the scheme of government prepared by Congress went into effect. Shortly after the transfer of the island to the United States, the President appointed a commission to investigate conditions in Porto Rico and draft a code of laws for the island. It recommended a separation of Church and State in the island, an improved system of taxation, a revised tariff schedule, the establishment of a public school system, and the encouragement of industrial enterprise by the grant of liberal charters. About the same time the civil government of the island was reorganized by order of General Davis. Bureaus of State, of internal revenue, and of agriculture were created and placed under the management of natives, subject to the supervision of the civil secretary to the Military Governor. An advisory board, known as the Board of Insular Policy, consisting of nine members, was created. At the same time the judicial system was reorganized and the island divided into five judicial districts under the jurisdiction of a Supreme Court at San Juan. By act of April 12, 1900, Congress provided a civil government for the island, but did not raise it to the status of a Territory, nor extend the Constitution and laws of the United States thereto. The inhabitants of the island were declared to be "citizens of Porto Rico and as such entitled to the protection of the United States." The form of government provided consists of a Governor appointed by the President by and with the advice and consent of the Senate, at an annual salary of \$8000; an executive council of eleven members, five of whom

must be natives of Porto Rico, appointed in the same manner as the Governor; and a legislature, consisting of the Council as an upper chamber and a House of Delegates popularly elected for a term of two years. There is a small property qualification and a low educational test for the exercise of the suffrage. The judges of the Supreme and District courts are appointed by the President. There are also a treasurer, a commissioner of education, and an attorney-general, appointed in the same manner. The island is represented in Washington by a resident commissioner, although he has no seat in Congress. In 1902 comprehensive codes of law and of legal procedure for the island were prepared by a commission representing native Porto Ricans and Americans. By these the Spanish law and procedure are partly supplemented and partly superseded by the American system of jurisprudence. Public order throughout the island is maintained by an insular police force of 670 men. The capital is San Juan.

HISTORY. The island of Porto Rico has from the beginning played a secondary part in the history of the West Indies. Overlooked by Columbus on his return from Hispaniola or Haiti in the spring of 1493, its southern shores were coasted by him on his second voyage in the winter of that year, when he gave it the name of San Juan Bautista. In 1508 Juan Ponce de Leon crossed the Mona channel from Hispaniola to investigate the reports of a rich and fruitful land in the island of San Juan. He was hospitably entertained by the native chief Agueyuada, whose power seems to have extended over most of the island. Two years later, having secured authority to conquer and govern the island, Ponce de Leon returned thither with a large military force. He followed the northern coast till he discovered the spacious bay on which he established his headquarters, founding a city which he named San Juan Bautista de Puerto Rico, whence comes the modern name for the whole island. Juan Ponce devoted himself for ten years, except during his first expedition to Florida, to the pacification of the island and the extirpation of the hostile Caribs from the islands toward the southeast. After his death in 1521, successive Spanish administrators continued to rule the island, which had a peaceful, uneventful history for nearly two hundred years. Under the repartimiento system, by which the Indians were forced to work on the Spanish plantations, the natives gradually decreased in numbers, and the consequent dearth of laborers resulted in the abandonment of many of the outlying estates. The Caribs in turn reentered the island and occupied largely the eastern portions, so that for many years the Spaniards appear to have been restricted to the districts immediately dependent upon San Juan, Ponce, and one or two other towns. The corsairs and West Indian pirates also visited the island, using various places on the coast for more or less temporary headquarters. In 1595 Drake, after trying to induce the inhabitants to ransom the town with money which they did not possess, sacked San Juan, and three years later it again suffered similarly from the Duke of Cumberland. Heinrich, a Dutch sea captain, undertook to do the same thing in 1615, but was beaten off, losing his life in the assault. About the middle of the eighteenth century negro slaves and colonists

from Spain began to be introduced in considerable numbers, and by 1780 the population had risen to nearly eighty thousand. In 1797 San Juan successfully withstood a three days' attack from the English under Lord Abercrombie. During the first quarter of the eighteenth century the island became a popular resort for large numbers of those who desired to escape from the turmoil and disaster incident to the revolutionary movements in South America. As a result, the population came to have a large preponderance of whites over the black and colored elements. Another consequence was the marked aversion of the populace to strife of any sort. An attempted rising against Spain in 1820 made headway for two or three years, but had no strong popular support. In 1867 another revolt was attempted by those who were engaged in the plots to free Cuba, but this was speedily suppressed. In 1869 Porto Rico was created a province of Spain, with representation in the Spanish Cortes by delegates elected by popular vote under the same suffrage as in Spain. The Governor-General was made the resident representative of the Crown, and in practice all administrative power was in his hands. In 1873 the Spanish Cortes passed an act for the abolition of slavery in Porto Rico. During the Spanish-American War the fortifications of San Juan were bombarded by a fleet under Admiral Sampson. On July 20, 1898, an expedition under General Miles landed on the island. Ponce surrendered on the 28th, and the American forces met with no effectual resistance until hostilities were terminated by the peace protocol of August 12th. On October 18th the United States flag was raised over San Juan. By the Treaty of Paris, signed December 10, 1898, Porto Rico was ceded to the United States. Following the establishment of a civil government in 1900, elections were held for the choice of a commissioner to Washington and members to the House of Delegates of the Porto Rican Legislature. With the beginning of representative government party lines were sharply drawn, the Republican and Democratic parties in the United States becoming the models for similar organization in the island.

PORTO SANTO, sän'tò. One of the Madeira Islands (q.v.).

PORTO TORRES, tór'rás. A seaport in Sardinia. See SASSARI.

PORTOVIEJO, pòr'tò-vvā'hò. The capital town of the Province of Manabí, Ecuador, 98 miles north of Guayaquil (Map: Ecuador, A 4). It is an old town with narrow streets. Its chief manufacture is that of straw hats. Portoviejo was first founded in 1534, but was several times

taken and burned by pirates. Its population is reported to be about 10,000.

PORT PHIL'IP. The harbor of Melbourne (q.v.), Australia.

PORTRAITURE. In the fine arts the representation, by means of painting, sculpture, or engraving, of the appearance of an individual or a group of persons. As regards size portraits may be busts, half figure, three-quarter or full length; as regards the position of the countenance, they are full face, half profile, profile or *profil perdu*, if the face is further reversed. Portraiture is of very ancient origin. Sepulchral statues of the earliest Egyptian empire show that the art was even then highly developed. During the best period of Greek art, ideal portraits of individuals, of a certain likeness, but rather intended to represent character types, were frequently executed, both in statues and in busts, as may be seen from the most celebrated surviving examples, the Lateran "Sophocles" and the bust of Pericles in the British Museum. Realism does not enter portraiture till the age of Lysippus, who was especially celebrated for his portraits of Alexander the Great, copies of which survive in the well-known busts in the principal European museums. At the same time portraiture was first practiced in painting by Apelles, also celebrated for his likenesses of Alexander. The only surviving portrait paintings of Greek art are those recently discovered in the Fayyum, of Græco-Egyptian workmanship, and dating from the second century a.d.

The realistic tendencies of the Etruscan Art were favorable to portraiture, especially in bronze, the material in which the Etruscans excelled; a good example is the bust of Brutus in the Capitoline Museum at Rome. Their art had a strong influence upon the Roman, which was, however, even more influenced by Greece in the development of portraiture, which became the most characteristic form of Roman sculpture. As with the Greeks, the body was portrayed as a type, in the ideal fashion, the resemblance to the individual being confined to the face. Costumes and insignia were portrayed in the most elaborate fashion. Busts were especially popular, and it became quite the fashion to collect them. (See **BUSTS**.) Beginning with the empire portraiture flourished at Rome until about the beginning of the third century, and about the time of Justinian, in the sixth century, it sank into disuse. A very common form of portraiture under the empire was upon ivory diptychs, which Roman, civil, and ecclesiastical officials distributed among their friends. This practice was continued by the Byzantines, who also used mosaics for portraiture, as may be seen in the celebrated examples of Justinian and Theodora in San Vitale, Ravenna.

The chief use of portraiture during the middle age was for sepulchral figures, which were portrayed recumbent, seated, or kneeling. Attempts at portraiture are often apparent in the faces of the statues of the Gothic cathedrals in France, and in the thirteenth century it attained a splendid development in the statues of donors, erected in German cathedrals of the transitional period, as at Naumburg and Bamberg. These likenesses were of an ideal character, but a more realistic portraiture was practiced in the latter fourteenth century, especially by the Netherlandish school, with centre at Dijon. The chief master

was Claux Sluter, and the statues produced were the most realistic portraits imaginable. This sculpture had, in turn, a marked influence upon contemporary painting in the Netherlands. The work of Jan van Eyck and his school, of the fourteenth century was highly characteristic and naturalistic, and most detailed in finish.

In so naturalistic an age as the early Renaissance, portraiture flourished to a high degree. It was first practiced at Florence by the sculptors, Donatello having revived the art in the form in his busts, which unite excellent characterization with an admirable naturalism, tempered by the antique. The art was continued by Desiderio da Settignano and Mino da Fiesole, and with high success in bronzes by Verocchio. It was not practiced the first half of the fifteenth century by the painters of Florence, but during the latter half Botticelli, Ghirlandajo, Pollaiuolo, and others attained high success. It was, however, reserved for the fifteenth century to unite with realism and subjective conception an ideal rendering of the subject, which made the portrait typical in the highest sense. This success was attained by most of the chief masters of the Renaissance, such as Leonardo, Andrea del Sarto, Raphael, and Lorenzo Lotto; among the Venetians by Giorgione, Palma Vecchio, Titian, Tintoretto, and by Morone of Brescia. During the same period the Germans practiced portraiture of quite a different type, less refined in form and more careful in detail, but with strong characterization in the work of men like Dürer, and with a perfect, objective realism in that of Holbein, who was chiefly active as a portrait painter in England.

Since the sixteenth century portraiture has found its chief expression in painting. Even during the decline of the Italian and other schools, portraiture remained comparatively good, because in it the artist is compelled to adhere to nature. With the great development of painting in the seventeenth century portraiture assumed a new importance, especially in the schools which attained the highest development, namely those of the Netherlands and of Spain. In Holland Rembrandt, by the skillful manipulation of light and shade and by skillful coloring, achieved highly realistic and characteristic results. Frans Hals, whose activity was confined to portrait painting, portrayed his figures in full light, and with genial observation; while Van der Helst and many others did good work in portraiture. This school developed the group picture, and heightened the effect of the portrait by an appropriate background. The work of the Flemish school represents a modification of the purely realistic conception by Italian refinement of color. Rubens's portraits were of wonderful strength and characterization, while Van Dyke's were of a more refined and courtly character. In Spain portraiture attained the highest possible development in the works of Velasquez, who with the subtle intellectual observation and the highest technique portrayed the Spanish grandees from the standpoint of absolute realism. During the same period portraiture of good, though a more artificial character, was practiced by the Eclectic schools, in Italy, and by the courtly painters of France.

Although the eighteenth century was an age of decline in painting, portraiture found in France a characteristic, realistic expression in the works

of the sculptors, like Houdon, and in the work of the great portrait-engravers like Nanteuil and Edelinck. In England an art of a realistic character flourished in the portraits of Reynolds, Gainsborough, Lawrence, and in those of Raeburn in Scotland. Portraiture has always been greatly in demand in England in aristocratic and court circles, and the greatest painters there have usually been portraitists.

During the nineteenth century the demand for portraits by no means decreased, and nearly all of the great figure painters have also been portraitists. In France Classicists, Realists, and Impressionists, have all contributed their quota to the evolution of the portrait, and to mention the names of those who have done good portraiture would be to enumerate the great figure painters of France. In the opinion of modern critics the portraits of classicists like David, Gerard, and Ingres are their very best work; at the present day Bonnat, Carolus Duran, and Benjamin-Constant are most universally known. In Germany portraiture has been less productive, but Lenbach, whose coloristic work is based upon that of the old masters, has done some of the best portraiture of the century. During the last half of the nineteenth century England has produced a series of good portrait painters in Millais, Herkomer, G. F. Watts, and Orehardson. English sculpture (q.v.) has succeeded best in portraiture while in France the portrait work of men like Rodin and Falguière is the very highest of its kind. Portraiture in medallions, which even at the time of the Renaissance, was prominent in French art, has achieved a very high development in the nineteenth century in the work of David d'Angers, Roty, Chaplain, Vernon.

The earliest American portraitists of the colonial and revolutionary periods like Copley, Trumbull, and Sully, resemble contemporary English painters in their eclectic manner, except Gilbert Stewart, who occasionally did work of a high order. Men of the middle period (see PAINTING) were Harding, Healy, Huntington, and Page and Eastman Johnston. In recent years America has produced a number of portraitists of exceptional ability, trained, for the most part, in France. Whistler's refined likenesses may be compared to those of Velasquez; Sargeant, brilliant, modern, and realistic, will bear comparison with any living portraitist; and among many others doing excellent work may be mentioned Chase, Melchers, and Cecilia Beaux. Portrait statuary has achieved equally great results in the works of Saint Gordon, McMonnies, Bartlett, and others. See BUSTS for the development of this important branch of sculpture.

BIBLIOGRAPHY. For antique portraiture consult the articles referred to under ICONOGRAPHY. See also Von Seidlitz, *Allgemeine geschichtliche Porträtwerke* (Munich, 1895); and the works of Marquet de Vasselot (Paris, 1880), and Pinset and d'Auriaac (ib., 1884) entitled *Histoire du portrait en France*.

PORTREEV'. The seaport and chief town of Skye Island, Inverness, Scotland. See SKYE.

PORTREEVE (AS. *portgerēfa*, from *port*, port + *gerēfa*, reeve, probably from *ge-*, generalizing prefix + **rōf*, OHG. *ruora*, Icel. *rōf*, number, or from *rōf*, famous, Goth. *hrōps*, OIIG. *ruof*, Ger. *Ruf*, outcry, AS. *hrōpan*, to cry out). The principal magistrate in a maritime town. The

chief officer under the Saxons in London was called the Portreeve, and the early mayors of that city and elsewhere were so designated, but the word gradually came in time to mean a chief magistrate and sheriff of a port, whose duties were to represent the Crown, preserve order, and collect the revenues. The term is still used in certain parts of England to designate a port warden.

PORT REPUBLICAIN, pōr rá'pu'blé'kán'. The capital of Haiti. See PORT-AU-PRINCE.

PORT ROYAL. A British naval station on the West Indian island of Jamaica, situated on a sandy spit at the entrance to Kingston harbor (Map: Cuba J 9). It is the principal station of the British naval forces in the Caribbean, and contains an arsenal, barracks, and a military hospital. The old Port Royal, which before its destruction by earthquake in 1693 was one of the chief towns of the West Indies, stood near the site of the present town.

PORT ROYAL. A village in Beaufort County, S. C., the terminus of the Port Royal and Augusta Railroad. Population, in 1900, 601. In this vicinity, in 1664, Captain Ribault, at the head of a company of French Huguenots, built a fort, which, in the following year, was taken by a force of Spaniards under Menendez, who massacred all the garrison; and in 1686 Lord Cardross founded a town, which was almost immediately broken up by the Spaniards. At the outbreak of the Civil War the entrance to Port Royal Sound, some distance below the town, was fortified by the Confederates, Fort Beauregard being built north of the entrance and Fort Walker south of it. Against these fortifications a strong Federal squadron, consisting of two frigates, three sloops, and seven gunboats, all under Captain (later Rear-Admiral) Du Pont, was sent late in 1861, and on November 7th the forts were captured and the harbor secured. The Confederate forces at this point were commanded by Gen. Thomas F. Drayton. The Federal loss in killed and wounded was about 30, that of the Confederates about 50. Consult Johnson and Buel (eds.), *Battles and Leaders of the Civil War*, vol. i (New York, 1887).

PORT-ROYAL-DES-CHAMPS, pōr rwá'yál' dá-shän'. A convent of the Cistercian or Bernardine nuns, near Versailles, which obtained much celebrity during the seventeenth century as a centre of Jansenism. It was founded by the wife of Mathieu de Montmorency in 1204 and soon after its establishment obtained from the Pope the privilege of receiving lay persons who, without taking monastic vows, desired to live in religious retirement. This feature of the Port-Royal rule became later of great importance. The discipline of the convent was much relaxed in the fifteenth and sixteenth centuries, and the superior was appointed from worldly or political motives. In 1602 Angélique Arnauld, sister of the celebrated brothers Arnauld, was appointed, when a child, coadjutrix of the abbess, whom she succeeded at the age of eleven. As the new abbess advanced in years, she undertook a reformation of the community in all its details—demanding a strict observance of religious poverty, abstinence from meat, complete seclusion, and the most severe ascetic exercises. The community removed to Paris in 1626, and in 1633 obtained a new convent, which

was thenceforward called Port-Royal-de-Paris; and from this time the old establishment of Port-Royal-des-Champs was the home of a lay community in accordance with the original Papal privilege. This community became very celebrated, and numbered among its inmates some of the most distinguished scholars of the time, Arnauld d'Andilly, the three brothers le Maistre (Antoine, Louis Isaac de Sacy, and Simon de Sérécourt), Nicole, Lancelot, and several others. The name of Pascal was closely associated with Port-Royal. The rule of life of the Port-Royalists was austere and they devoted many hours to prayer, spiritual reading, instruction, and manual labor. They prepared for these schools the well-known text-books of the Port-Royal series, such as Greek and Latin grammars, works on general grammar, geometry, and logic.

In 1643, inspired by profound love for children, the Port-Royalists founded the Little Schools, first at Port-Royal and then in Paris, in which they received a small number of pupils. The study of the vernacular was strongly emphasized in these schools, the general aim being to develop the reason, judgment, and power of personal reflection rather than a mastery of Latin. For the first time in the history of French education, the study of French received careful consideration. In teaching pronunciation and spelling they almost approached the modern phonetic method. The schools had but a short existence and embraced but a limited sphere, but the principles laid down had a salutary influence on education in France throughout the succeeding centuries.

Greater importance for the time was given to the community by its pertinacious adherence to the Jansenist views (see JANSENISM), and by the number of polemical works which issued from Port-Royal. The nuns having refused to subscribe the formula condemning the five propositions of Jansenius, a royal order was issued in 1660 for the suppression of the school and the removal of the boarders, and the abbess and several other nuns were arrested and confined as prisoners in other monasteries. After the "peace of Clement IX.," they were permitted to return; but the two communities, Port-Royal-des-Champs and Port-Royal-de-Paris, were placed under separate government. This led to many disputes, and to a continued adherence at Port-Royal-des-Champs to the Jansenist spirit and opinions; and when the final steps for the repression of the Jansenists were taken in 1705 and the following years, a formal bull was issued by Pope Clement XI. for the suppression of the old convent and the transfer of its property to Port-Royal-de-Paris. In 1709 the nuns were finally dispersed and distributed among convents of different Orders throughout France. The property of the convent and church was transferred to the Paris house, and all the buildings of Port-Royal-des-Champs were leveled to the ground, by order of the King. See Sainte-Beuve, *Port-Royal* (5th ed., 7 vols., Paris, 1887); Racine, *Histoire abrégée de Port-Royal* (Paris, 1742; new ed., 1865); Beard, *Port-Royal* (2 vols., London, 1861); Cadet, *L'éducation à Port-Royal* (Paris, 1887); Ricard, *Les premiers Jansénistes et Port-Royal* (ib., 1883).

PORT SAID, *sâ-âil'*. A seaport of Egypt, situated at the Mediterranean end of the Suez Canal

(Map: Egypt, F 1). It has frame houses. Its harbor, with colossal piers of concrete, has ample docks and accommodations for vessels. There is a lofty lighthouse. Port Said has an export trade in cotton, and is an important coaling station. It is the seat of the Governor-General for the Suez Canal. The town dates from 1859, when work on the canal was begun. Population, 37,000, of whom about one-third are Europeans.

PORTSMOUTH, *pôrts'mûth*. A seaport and the chief naval arsenal of Great Britain, situated in Hampshire, on the southwest shore of Portsea Island, 74 miles southwest of London (Map: England, E 6). Portsmouth has the most complete fortifications in Britain. These comprise, on the landward side, the outer line of the Portsdown forts and the Hilsa lines; to seaward, the Spithead forts.

Southsea, which is situated outside the walls skirting Southsea Common, is rapidly increasing, and is a fashionable watering-place. Pleasing views may be had, from the ramparts and batteries, of the harbor, the roadstead of Spithead, and the Isle of Wight. The town itself is uninteresting; among the few notable buildings is the Church of Saint Thomas, the chancel and transepts of which date from the twelfth century. Besides the parish, the municipal and Parliamentary limits include Portsea, Landport, and Southsea. The town of Gosport (q.v.) is separated from Portsmouth by the harbor entrance. Portsmouth harbor, about 420 yards wide at its entrance, extends inland for about four miles and has a breadth of three miles along its northern shore. The outward entrance is defended by Monkton Fort and Southsea Castle. The harbor is situated close to the magnificent anchorage of Spithead, where 1000 ships of the line may ride without inconvenience, under shelter of the Isle of Wight, and opposite the French arsenal of Cherbourg. The dockyard has an area of 293 acres. Of this immense naval establishment, the most noteworthy features are the dry docks, spacious enough to admit the largest vessels.

The local trade of Portsmouth is supported mainly by the Government dockyard and other public establishments. Brewing is carried on, and there is considerable traffic in timber, coal, cattle, and agricultural produce. The importance of the port dates from the reign of King Henry VIII. Its defenses were strengthened by Elizabeth and by William III. The municipality holds various charters, the first granted by Richard I. Its principal asset is its docks. It owns an electric lighting plant, and tramways, and maintains public baths, cemeteries, libraries, and a technical school. Porchester Castle, a ruined Norman fortress to the north of the harbor, occupies the site of the Roman *Portus Magnus*. The town was burned by the French in 1372. In 1642 it was taken by the Parliamentarians. In 1782 the *Royal George* sank in the harbor with a loss of nearly 1000 lives. Portsmouth is the birthplace of Charles Dickens and George Meredith. Population, in 1891, 159,000; in 1901, 189,000. Consult Saunders, *Annals of Portsmouth* (London, 1880).

PORTSMOUTH. A city and one of the county-seats of Rockingham County, N. H., 58 miles north-northeast of Boston; on the Piscataqua River, about three miles from the Atlantic Ocean,

and on the Boston and Maine Railroad (Map: New Hampshire, L 9). It is a port of entry and the only seaport in the State, situated on a peninsula overlooking the harbor, which is deep and commodious, fortified, and dotted with islands that make the site of the city one of great picturesqueness. On one of the islands, formerly called Fernald's Island, is the United States navy-yard, the place of construction of such famous vessels as the *Ranger* and the *Kearsarge*. Many of the islands in this vicinity, particularly the Isles of Shoals, are noted summer resorts. Portsmouth itself is a well-known resort, attractive for its fine situation and for the historic interest of its colonial mansions, several of which are still standing. It is also closely connected with the popular watering places of the coast.

There are three parks: Goodwin, Langdon, and Haven. Among the edifices of note are the old residences of Governors Wentworth and Langdon, Saint John's Church, the Federal Government building, and the Portsmouth Athenaeum, with a museum and a library of 24,000 volumes. The city has also a public library, containing more than 16,000 volumes, and several charitable institutions. Portsmouth is of considerable importance as a manufacturing centre, its establishments including a large shoe factory, several breweries, a shoe-button factory, and manufactories of button-sewing machines, locks, boot and shoe heels, and marble and granite. The government, under a revised charter of 1895, is vested in a mayor, annually elected, a bicameral council, and in administrative officers, among whom the police commissioners are appointed by the State Governor. The water-works are owned and operated by the municipality. Population, in 1890, 9827; in 1900, 10,637.

Portsmouth was settled in 1623 by the Laconia Company, headed by Sir Ferdinando Gorges and Captain Mason, and for many years was known as Strawberry-Bank. Before New Hampshire was organized in 1679, Portsmouth lay within the limits of Massachusetts. It was incorporated as a town and named Portsmouth in 1653, and in 1849 it was chartered as a city. Until 1807 it was the capital of the State.

PORTSMOUTH. A city and the county-seat of Scioto County, O., 100 miles east-southeast of Cincinnati and equally distant to the south from Columbus; at the junction of the Ohio and Scioto rivers, and the terminus of the Ohio Canal, and on the Baltimore and Ohio Southwestern, the Norfolk and Western, and the Chesapeake and Ohio railroads (Map: Ohio, D 8). Several steamboat lines add to the transportation facilities. Situated on a plain in a productive agricultural section with considerable mineral wealth, the city is an important industrial and commercial centre. It has a public library and the Hamilton Peebles Reading Room, a City Hospital, and homes for old ladies and children. There are several attractive parks: Grandview, Millbrook, Tracy, York, and Athletic. The Scioto Valley is famous among archæologists for the many remains of the Mound Builders.

The manufacturing interests of Portsmouth are developing rapidly, its various industries, in the census year 1900, having invested capital to the amount of \$4,114,000 and products aggregating in value \$7,533,000. There are shoe fac-

ories, fire-brick, paving and building brick plants, stove and range works, car shops, planing mills, foundries and machine shops, furniture and veneering factories, hub and spoke works, stone saw mills, rolling mills, paper box factories, a brewery, and a distilling and rectifying plant. The government is administered by a mayor, elected every two years, and a unicameral council. Most of the subordinate officials are appointed by the mayor and confirmed by the council, or elected by that body. The following important officers, however, are chosen by popular vote: the board of public service, having in charge the business management of the city; city solicitor, city auditor, city treasurer, members of the school board, ward assessors, and justices of the peace. The water-works and electric light plant are owned by the municipality. Portsmouth was settled in 1803, and was incorporated in 1814. Population, in 1890, 12,394; in 1900, 17,870.

PORTSMOUTH. A city and the county-seat of Norfolk County, Va., on the Elizabeth River, opposite Norfolk, with which it is connected by ferry (Map: Virginia, H 5). The two cities, with Berkley constituting in reality a single municipality, possess a fine harbor and good transportation facilities. The Seaboard Air Line terminates in Portsmouth. The Atlantic Coast Line and the Southern Railway have depots here, and all other roads that enter Norfolk, except the Norfolk and Western, maintain connections with the city. The customs district of Norfolk and Portsmouth in 1901 ranked ninth among Atlantic coast ports in the value of its foreign commerce, aggregating over \$10,902,000. See NORFOLK.

Portsmouth, in contrast with Norfolk, is regularly laid out, and is the home of many business men of the greater city. Its chief features include the United States Navy Yard, situated in the southern part of the city, which has two large dry docks and a plant for the construction of steel vessels, and the United States Naval Hospital and park in the northern portion of the city. There are in Portsmouth extensive cotton mills and other manufactories, and railroad shops of the Seaboard Air Line. The government, under a revised charter of 1893, is vested in a mayor, elected every four years, and a bicameral council, and in administrative officers, among whom the members of the school and health boards are chosen by the city council. Settled in 1752, Portsmouth was chartered as a city in 1858. Trinity Episcopal Church here was first built in 1762. Before the Revolutionary War, the British operated a ship-yard on the site of the present navy-yard. Population, in 1890, 13,268; in 1900, 17,427.

PORT TAMPA CITY. A town in Hillsboro County, Fla., 9 miles south of Tampa, on Tampa Bay (Map: Florida, F 4). It is the southern terminus of the Atlantic Coast Line Railroad, which here connects with steamers for Havana, Key West, Mobile, and other points; and has excellent harbor facilities. The town is the centre of a fertile region, producing large quantities of oranges, pineapples, and vegetables, and is the shipping port of Tampa (q.v.). It also has some reputation as a health resort. Port Tampa City was settled in 1889 and was incorporated four years later. It was the place of embarkation of the Santiago expedition in the Spanish-American war. Population, in 1900, 1367.

PORT TOWNSEND. A city and the county-seat of Jefferson County, Wash., 35 miles north by west of Seattle, on Port Townsend Bay, at the entrance to Puget Sound. It has steamship connection with Alaska, San Francisco, and various ports of the Orient (Map: Washington, C 1). The Port Townsend Southern Railroad and a branch of the Northern Pacific, which are under course of construction, will add greatly to the commercial importance of the city. The harbor is one of the largest in the world, and is protected by three forts, equipped with the most modern guns. The city is favored with a fairly equable climate, owing to the influence of the Japan Current, and is surrounded by picturesque mountain scenery. It is well laid out, and has fine business blocks and public buildings, and attractive residences. Among the noteworthy edifices are the United States Custom House, county court-house, city hall, high school building, United States Marine Hospital, Saint John's Hospital, the sanatorium, and the buildings of the United States Quarantine Station. A public library is maintained by the city.

The neighboring region is engaged in lumbering, dairy farming, and fruit-growing, and also has considerable oil and mineral wealth. Port Townsend is a port of entry for the Puget Sound customs district, the trade of which in 1902 was valued at \$47,478,000, including exports to the amount of \$34,726,000. Lumber, grain, farm and dairy products, live stock, fish, and oil are the chief articles of commerce. The industrial establishments comprise steam boiler works, a machine shop, saw and planing mills, a ship-yard, salmon and sardine canneries, herring pickling and curing works, bottling works, etc. The Irondale furnaces on Port Townsend Bay are noted for their extensive production of pig iron, the iron used in the construction of the cruisers *Charleston* and *San Francisco* and the battleship *Oregon* having been made here. Under the charter of 1890, the government is administered by a mayor, chosen annually, and a unicameral council. Port Townsend was settled in 1851, and was incorporated in 1860. Population, in 1890, 4558; in 1900, 3443.

PORTUGAL. One of the smaller States of Europe, occupying most of the western part of the Iberian or Pyrenean Peninsula. Comprised between the parallels of 37° and 42° N. and the meridians of 6° 15' and 9° 30' W., it has a continental area of 34,528 square miles, a little larger than Maine. The Azores and Madeira Islands, classed as an integral part of the kingdom, have an area of 1510 square miles, making the total area of the kingdom 36,038 square miles. The colonial possessions are nearly 22 times as large as the kingdom. Portugal is bounded on the north and east by Spain and on the south and west by the Atlantic Ocean. It extends about 350 miles from north to south and an average width of about 100 miles from east to west. No country is better provided with natural boundaries. Rivers or mountain ramparts separate it from Spain. The Minho, Douro, Tagus (Tejo), and Guadiana, flowing in deep valleys, form boundaries in parts of their courses. Portugal may almost be said to have a climatic boundary. The limit of rains brought by the westerly winds from the Atlantic coincides very nearly with the political boundary. On the side of Portugal are a humid atmosphere, copious rains, and luxuri-

ant vegetation. On the side of Spain are cloudless skies, a thirsty soil, and treeless plains.

TOPOGRAPHY. The kingdom occupies the greater part of the Atlantic slope of the great peninsular tableland. The country has a coast line of nearly 465 miles. The harbors are relatively numerous, though those in the north are obstructed by sand bars. The most important are those of Lisbon, in the widened estuary of the Tagus; Oporto, on the Douro, near its mouth; and Setubal (the famous salt port), at the head of Setubal Bay. Lagos, founded by the Carthaginians, and Villa Nova, both on the south coast; Buarcos and Figueira, at the mouth of the Mondego; and the roadstead of Leixoes near Oporto, where an artificial harbor has been built, are smaller ports. It was partly due to the superior situation of the ports for intercourse with West Africa and South America that Portugal stood in the forefront of over-sea enterprises in the greatest era of geographic discovery.

A large part of the interior is filled with mountains. The country north of the Tagus is most mountainous and elevated. Of the three great mountain systems the fine Serra do Gerez of the north is the western extremity of the Pyrenean system, and the magnificent Serra da Estrella, between the Douro and Tagus, is the western prolongation of the great central range of Spain. They have many offshoots and foothills and the Estrella range traverses the great plain of the Province of Beira. The Tagus divides Portugal into two portions, which differ much in appearance, climate, and soil. North of the Tagus are imposing mountain chains, transverse hill ranges, beautiful and fertile valleys; but south of the river the mountains rarely assume the aspect of ranges and do not rise high above the surrounding plateau. Thus Southern Portugal is the least attractive part of the kingdom—a succession of plains, hills, thinly wooded lands, and sandy coastal tracts. It includes, however, the third conspicuous orographic system of the kingdom, the Serra de São Mamede, on the border between Portugal and Spain.

HYDROGRAPHY. The principal rivers have their origin in Spain, the only important river entirely possessed by the Portuguese being the Mondego, which waters a fertile valley, but is useless for commerce. The rivers Minho, Douro, Tagus, and Guadiana are generally navigable as far as the Spanish frontier and in the lower part of their courses even for large vessels. The Tagus is deep enough for seagoing ships for 90 miles, and the Douro as far as Oporto. While the rivers are very important in the communications of the country, they have not yet been effectively regulated for purposes of navigation. The Minho River forms part of the northern boundary between Spain and Portugal; its valley is very fertile, and its salmon and lamprey fisheries are important. The Douro irrigates the vine regions which produce the famous port wine exported from Oporto. The lower Tagus crosses plains of great fertility and widens at Lisbon to a great basin, one of the largest and finest harbors in the world.

CLIMATE. The climate is oceanic except in the eastern districts. High degrees of temperature are registered only in the south, and, owing to the neighborhood of the sea, the climate may generally be described as temperate. North of the Douro the mean annual temperature is 50° F.,

between the Tagus and Douro about 60°, and in the Guadiana Valley 65°. Lisbon has a mean temperature in January of 50° and in July of 69.8°. The precipitation at Lisbon is about 40 inches a year, and Coimbra, the most populous town between Oporto and Lisbon, is the rainiest place in Europe, the clouds parting with their moisture against the sides of the surrounding mountains, where as much as 192 inches of rain have fallen in a year. On the whole, the soils are not rich, for there are wide expanses of sandy and thin soils; some of the valleys and plains, however, are extremely fertile.

FLORA. The vegetation, which is that of Central and Southern Europe, is practically identical with the flora of Spain. The kind of vegetation is denoted by the prevalent forest trees—in the north the oak, in the middle the chestnut, and in the south the cork tree. The culture of the orange is extended the entire length of the coast. The olive is found everywhere, but the date palm is limited to a fringe along the south coast.

FAUNA. The wild animals are those of Spain. Sardines and the tunny are most conspicuous in the coast fisheries, which are highly productive.

GEOLOGY AND MINERAL RESOURCES. Almost all the geologic formations are represented. Granite is predominant among the northern mountains, gneiss throughout the Douro Valley, mica schists occur irregularly here and there, and basalt is conspicuous in the surroundings of Lisbon. The older fossiliferous formations are conspicuous in the north and centre and cover most of South Portugal. Mesozoic formations occur along the coast between Lisbon and Aveiro, and several mountain chains in the central regions are formed of Jurassic rocks. Portugal suffers occasionally from the seismic disturbances which afflict the peninsula. The great earthquake of 1531 did enormous damage, and that of 1755, in which only one-quarter of Lisbon escaped destruction, was probably the most violent ever witnessed in Europe. The most important mines are in the copper region of Alemtejo and among the iron ores of Moncorvo. Coal is worked at Cape Mondego and is also found in the environs of Leiria. The mining industry, however, is in a worse condition even than that of Spain. Many mines in this richly metalliferous country, which includes also lead, manganese ore, tin, zinc, and antimony among its resources, are idle, and those that are worked are for the most part in the hands of foreigners. Very large quantities of salt, chiefly sea salt (at Setubal, 300,000 tons annually), are produced and much is exported. The Portuguese sea salt is regarded as the best in Europe.

AGRICULTURE. The surface of the country, according to the uses made of it, may be thus divided: agriculture and gardening, 22.4 per cent. of the total area; the vine, 2.2; pasturage and hay, 26.7; woodland, 2.9; unproductive, 45.8. The result is that the food requirements of the scanty population are not met. Farming also is in a low state of development and methods and implements are very primitive. The Portuguese plow has been described as "a crooked branch with a ten-penny nail tied to the end of it." There are three principal regions of cereal culture: that of maize, chiefly north of the Tagus River, where the climate is more humid than in the south; that of wheat, on the wide dry warm plains south of the Tagus; and that of rye, on the

poorer dry soil and in the colder temperature of the eastern lands bordering Spain. Flax is extensively grown in the north and citrus fruits and olives are produced in the south. Vine-growing, the most noted branch of Portuguese husbandry, is of great importance, particularly on the Douro, where the costly port wine is produced. Though the industry is carried on in somewhat antiquated fashion, Portugal is one of the leading wine countries, judged by the quality of its wine. The largest vineyard in the world, at Póceirão (5930 acres), contains 6,000,000 vines, annually producing about 2,650,000 gallons of red and white wine.

Live-stock raising is an important branch of agriculture, the number of horses averaging 90,000; mules and asses, 200,000; cattle, 600,000; sheep and goats, 4,000,000; and swine, over 1,000,000. Cattle are raised in largest numbers in the valleys and on the plains of the north, while sheep and swine are found chiefly in the south. Silkworm culture is increasing, particularly in the north.

MANUFACTURES. The manufacturing industries have only inferior development, but they are progressing, especially in Oporto and Lisbon. The chief manufactures are textiles, particularly woolsens, and also cotton, linen, and silk goods. The cottons are made chiefly for export to the colonies. In the neighborhood of Oporto there are 15 cotton mills. The chief seats of these manufactures are Lisbon, Oporto and the neighboring Braga, and Covilhao. Other products are hats, leather, spirits from sugar cane, porcelain, tobacco, shoes, ironware, brandy, and soap. Ship-building has been increasing in importance within the last few years. The population engaged in industries outside of agriculture in 1900 was 447,620.

COMMERCE. The average annual foreign trade, in millions of dollars may be seen in the following table:

	1881-85	1891-95	1899	1901
Imports.....	40.2	44.3	54.7	58.3
Exports.....	25.5	38.1	31.1	29.0

Great Britain is most important in the foreign trade of the kingdom. In 1901 28 per cent. of the imports came from Great Britain, 15 per cent. from the Portuguese colonies, 13 per cent. from Germany, 10 per cent. from the United States, 9 per cent. from Spain, and 8 per cent. from France. Great Britain took 29 per cent. of the exports; Spain, 13 per cent.; the Portuguese colonies, 12 per cent.; and Brazil and Germany, 11 per cent. each. The imports largely exceed the exports, on account of the quantities of raw materials brought in from the colonies and foreign countries, and the foreign food substances, textiles, coal, and machinery, which are consumed by the people. The value of the leading imports, in million dollars, in 1901, was: coal, 5.4; cotton goods, 4.1; raw cotton, 4.3; codfish, from Norway and British North America, 4.2; sugar, 2.8; iron and machinery, 3.9; woolsens and yarn, 1.4; rice, 1.4; hides and goat skins, 1.5. The leading exports in million dollars were: wine, 10.1; cork, the second largest export, 3.5; copper ore, 1.4; olive oil, 1.2; sheep, 0.8.

Wine represents from one-third to one-half of the exports. About one-half are common wines,

A Longitude 8 West from Greenwich 6 C 4

the remainder being divided nearly equally between liqueurs and port wine, with a considerable quantity of Madeira. Most of the wine is sent to Brazil, England, and the Portuguese colonies. Considerable quantities of eggs, onions, potatoes, and other vegetables are exported to England.

TRANSPORTATION AND COMMUNICATION. The domestic trade is much facilitated by the rivers. The wagon roads have been improved and extended in late years, and in 1901 1464 miles of railroads were in operation, of which 507 miles belonged to the State. The railroad lines are practically adequate to the needs. The coasting trade is very active. In 1901 4164 vessels, of 1,322,095 tons, engaged in this trade entered the ports, and 4072 vessels, of 1,249,011 tons, cleared. The foreign trade is chiefly maritime. The chief emporia for this trade are Lisbon and Oporto. The number of vessels in the foreign trade entering the ports in 1901 was 6493, with a tonnage of 10,414,793; cleared, 6516 vessels, tonnage 10,395,615. The larger proportion of the shipping is under the British flag. At the beginning of 1902 the commercial navy of Portugal including the colonies, contained only 44 steamers, of 29,443 tons, and 238 sailing vessels, of 56,588 tons. Regular shipping communication is maintained with many ports, as the steamers of most lines plying to South America, Western Africa, the Mediterranean, and Eastern Asia touch at Lisbon, and in many cases at Oporto also. Thus the Portuguese ports are way stations on many important routes.

BANKING. The banks, including savings banks, numbered 35 in 1895. At that time the cash in hand was 18,252,007 milreis (the milreis = \$1.08); bills, 26,028,403 milreis; loans on security, 24,818,841 milreis; deposits, 32,645,944 milreis; note circulation, 59,075,973 milreis. The principal bank is the Bank of Portugal, whose metallic stock at the close of 1902 was 10,719,031 milreis; note circulation, 69,475,741 milreis; and deposits, 2,922,267 milreis.

EDUCATION. Primary education is nominally compulsory, but the law is not enforced. Very few of the children of the lower classes attend school, and in 1890 nearly four-fifths of the population could not read. In that year there were 5339 primary schools, with 237,791 pupils, or only 471 in 10,000 of the population. In 1899 the number of primary schools had decreased to 4483. Secondary schools are maintained in the chief town of each district and in a few other towns. They had 4248 pupils in 1900. Many private secondary schools are maintained, and also schools for industrial, commercial, and technical training. The University of Coimbra, founded in 1290, had 1690 pupils in 1900.

RELIGION. The State religion is the Roman Catholic faith. All other forms of worship are tolerated; the Protestants are chiefly foreigners. The kingdom is divided into three ecclesiastical provinces, with their seats at Lisbon, Braga, and Evora. A Patriarch presides at Lisbon, and if he is not a cardinal when he enters office, he receives that dignity as soon as a place is vacant in the Holy College. Braga and Evora are under the jurisdiction of archbishops. In 1834 the 632 monasteries and 118 nunneries, with over 80,000 nuns and monks and an annual income of nearly \$5,000,000, were suppressed and their property confiscated for the benefit of the State.

FINANCE. The annual revenue for a number of

years has averaged about \$53,000,000 and the expenditures a little more than that sum. Nearly half of the revenue is derived from the high customs duties, the chief other sources being direct taxes, registration and stamps, and income from national property.

In 1902 the total foreign debt amounted to \$325,938,740 and the internal debt to \$520,153,730; total, \$846,092,470. Owing to the derangement of the finances, steps were taken in 1891 to reduce the interest on the debt. In 1892 the interest on the internal debt was reduced by 30 per cent. payable in currency, and in 1893 the interest on the external debt was reduced by 66 2/3 per cent. payable in gold.

WEIGHTS, MEASURES, AND MONEY. The gold standard is employed and the unit of coinage, the milreis, is worth \$1.08. Silver, nickel, and bronze coins are also in use. The metric system of weights and measures is the legal standard, but the old measures are still in use.

DEPENDENCIES. The dependencies of Portugal are given in the following table, with areas and population (for details, see the respective articles):

	Area, English sq. miles	Population
Possessions in Africa:		
Cape Verde Islands (1900).....	1,480	147,424
Portuguese Guinea.....	12,000	820,000
Prince's and Saint Thomas' Islands.....	360	42,103
Angola.....	484,800	4,119,000
Portuguese East Africa.....	310,000	3,120,000
Total, Africa.....	808,640	8,248,527
Possessions in Asia:		
In India: Goa.....	1,080	561,400
Daman.....	168	77,454
Indian Archipelago (Timor, etc.).....	7,458	300,000
China: Macao, etc.....	4	78,627
Total, Asia.....	8,710	1,017,481
Total, colonies.....	817,350	9,266,008

POPULATION. The number of inhabitants in 1900, including the Azores and Madeira, was 5,428,659, the density of population being 150.6 to the square mile. The urban population was 31 per cent. in 1890. In 1890 the foreign population numbered 39,000, of whom 27,000 were Spanish and 5000 Brazilian. In the ten years 1890 to 1900 the increase in population was 378,930, or at the yearly rate of 0.75 per cent. of the population in 1890. There are very few large towns, the most important, with their population in 1900, being: Lisbon, the capital, 357,000; Oporto, 172,421; Braga, 24,309; Setubal, 21,819; and Coimbra, 18,424. Portuguese emigration, which of late years has usually numbered over 20,000 annually, is chiefly to Brazil and the United States. In 1900 18,908 emigrants went to America and 1938 to Africa.

The list of the provinces and districts, with areas and populations for 1890 and 1900, is shown in the table on the following page.

ETHNOLOGY. The Portuguese are the longest-headed people in Europe (cranial index, 75-77). In stature they are below the average (1.61-1.67 m. or 5 feet 3 inches to 5 feet 5 3/4 inches in the south and an inch taller in the north). Blond hair is practically absent. Black hair is possessed by one-fifth of the population; in the re-

mainder the hair is very dark. Portugal was engaged in the slave trade for nearly four centuries. During that period many thousands of African and Brazilian negroes finally settled in the provinces of Algarve and Estremadura, and a large mulatto contingent in the population is the result. Stone Age relics are common in Portugal, and there have even been discovered seeming indications of human occupation in the Tertiary Age. Megalithic monuments are also common, occurring in the shape of dolmens, from which the tumulary envelope has been removed. In the smaller ones the crypt is made up of four large dressed stones, covered by a fifth; in the more elaborate the chamber is larger, round or irregular in outline, and approached through an avenue. In them along with the dead are found implements of chipped and polished stone, weapons and ornaments, turquoise beads, etc. The most interesting remains of the classical epoch are the so-called *citánias*, hill cities or forts. Two of them crowning the summits of low mountains in the northwest corner of Portugal have been carefully explored. A long wide street is lined on each side with ruins of stone houses. The walls are built of large, irregular blocks well adjusted, the interiors being revetted with smaller stones. The foundations are round and are built up in spiral. A thatched roof, doubtless, was sustained by a central pillar of wood, the stone support of which is to be seen in many ground plans. On

both sides of the door and along the wall are the remains of a penthouse sustained by six pillars, of which the stone bases yet remain. Pottery and glassware abound in them. Flagstones are covered with sculptures and the walls are decorated with circles, coils, and frets. The latest coin found in any of them was of Constantine I. (306-337). Inscriptions on some of the houses are in Roman letters.

GOVERNMENT. The present Constitution of Portugal consists of the Constitutional Charter, granted by King Pedro IV. April 29, 1826, the additional acts of July 5, 1852, of July 24, 1885, and of March 28 and September 25, 1895. The form of government is that of a representative constitutional monarchy, with the system of ministerial responsibility in legislation and administration. The legislative power is vested in a Cortes of two chambers: the House of Peers and the Chamber of Deputies. The House of Peers consists of the princes of the royal blood who have attained the age of twenty-five, the bishops and archbishops, who are peers of right, and about 90 peers appointed at will by the King, their dignity being hereditary, although a law of July 24, 1885, has provided for the gradual abolition of hereditary peerages. The Peers have an equal initiative with the Deputies and the Government, except as to measures relating to imposts and recruitment, and may constitute themselves into a high court of justice for the trial of members of the royal family and high officials. By the law of August 8, 1901, elections to the Chamber of Deputies are by all male citizens twenty-one years of age who can read and write or who pay taxes amounting to 500 reis. Deputies must be graduates of a secondary or professional school or in the enjoyment of an income of not less than 400 milreis per year. Disqualified for membership are peers, naturalized citizens, and certain employees of the Government. The Deputies are apportioned according to population, at present the ratio being one Deputy to every 36,000 inhabitants. The total number is 155, of which seven are returned by the colonies. They are chosen in single electoral districts, and sit for four years unless the Cortes is sooner dissolved. Their chamber has the usual powers and duties of a lower chamber in a parliamentary system. The executive power is vested in the Crown, which is hereditary, females succeeding when males are wanting. The Crown has the usual powers intrusted to a constitutional monarch, but its veto is only suspensive. The King is inviolable and irresponsible. He, therefore, acts officially through responsible ministers who have a seat in the Cortes and take part in its deliberations. The King is also assisted by a Council of State consisting of about 16 members appointed by himself for life. For the purpose of administering justice the country is divided into *comarcas* or districts, in each of which a court of first instance held by a single judge is provided. There are also in each district a number of justices of the peace, who have jurisdiction in minor civil and criminal cases. Above these are three courts of second instance located at Lisbon, Oporto, and Ponta Delgada, in the Azores, which have original jurisdiction in certain cases and hear appeals from the lower courts, while the ultimate judicial authority is the Supreme Court at Lisbon. It is divided into two chambers, has original jurisdiction in a variety of matters, and

is a final court of appeal for the whole kingdom. Trial by jury is allowed in criminal cases.

For the purpose of local government, Portugal, with the neighboring isles, is divided into 21 districts, corresponding somewhat to the French departments. The districts are again divided into *communes* (*concelhas*); and these are further subdivided into parishes, about 4000 in number. In each district there are a popularly elected assembly or *junta*, a permanent executive commission chosen from the membership of the *junta* and charged with the execution of its deliberations, an administrative tribunal for the settlement of administrative controversies, and a Governor appointed by the King and charged with the supervision of matters of central administration in the district. The commune is an administrative circumscription varying in population from 500 to 15,000 inhabitants. Its chief organs of government are an elected municipal council with a president, whose duty it is to execute the resolutions of the council, and an *administrador*, appointed by the King and charged with the supervision of central affairs in the commune. In each parish there is an elected assembly or *junta*, with a president who is charged with the execution of its resolutions, which for the most part relate to ecclesiastical affairs and poor relief.

HISTORY. What later became Portugal was inhabited in prehistoric times by a branch of the Celtiberian race, made up of the native Iberian stock of the peninsula and the immigrant Celts. Greek colonies were planted at the mouths of the three rivers, the Tagus, the Douro, and the Minho—the name of Lisbon being derived from the ancient Greek *Olisipo*. The Carthaginian influence was weaker in this part of the peninsula than in the eastern. The Roman conquest was begun in B.C. 189 and was gradually completed in the two generations following, though with much difficulty, Viriathus (q.v.), the leader of the Lusitania in their revolt (c.153-140 B.C.), proving a formidable adversary. The Roman province of Lusitania under the Empire contained most of the territory of modern Portugal south of the Douro. In the fifth century Roman control in the peninsula gave way to that of the Visigoths without especially affecting this remote corner. It was included in the area of Mohammedan conquest in the eighth century. In 997 the territory between the Douro and the Minho was taken from the Arab-Moors by Bermudez, King of Galicia, and in 1064 the reconquest was completed as far south as Coimbra by King Ferdinand the Great of Castile and Leon. The reconquered districts were organized as counties, feudal appanages of Galicia. From the northern county, the *Comitatus Portucalensis*, extending about the Roman *Portus Cale* (the modern Oporto), the new nation finally took its name. In the division of Ferdinand's realm Galicia with Oporto and Coimbra went to his third son, Garcia, but the eldest son, Alfonso VI. of Leon, forcibly united all the family possessions in 1073. The new Mohammedan attack under the Almoravides (q.v.) put Alfonso on the defensive. Among those who came to his assistance was Count Henry of Burgundy, who married Theresa, an illegitimate daughter of Alfonso, and received Coimbra and Oporto, with the title of Count of Portugal (1095). During the interneecine wars before and after the death of Alfonso in 1109 the Portuguese began to develop a national spirit and to

distinguish themselves from the hitherto dominant Galicians. This was especially true after the death of Count Henry in 1112, when his wife devoted herself to upbuilding an independent kingdom for their infant son. The latter, Alfonso I., assumed the government in 1128 and fought valiantly against the Moors, over whom he won a splendid victory at Ourique in 1139. This was followed by his assumption of the kingly title and long wars necessitated by the attempts of Castile to subdue his dominions. Alfonso took Lisbon from the Moors in 1147 and made it his capital. He died in 1185, after a long and brilliant reign. His son and successor, Sancho I. (1185-1211), gained from the gratitude of a prosperous country the title of 'the Founder.' Alfonso II. (1211-23) followed Sancho's wise policy, but came into conflict with the Papacy, which culminated in the King's excommunication and an interdict laid upon the kingdom. His son Sancho II. (1223-45) was also excommunicated, the country being put under an interdict, and was finally deposed by Pope Innocent IV. He died in 1248. His brother, Alfonso III. (1248-79), was on better terms with the clergy and also proved to be a capable ruler. The country had now reached its utmost European limits, and its course had been steadily progressive, except for the unfortunate years of struggle with the Church. The long reign of Denis or Diniz (1279-1325), the son of Alfonso III., was a period of progress and development hardly equalled at that time in Europe. Under him Portugal entered on that course of commercial enterprise which was the source of all the country's wealth and greatness. In 1290 he founded the University of Lisbon (transferred to Coimbra in 1308). His son Alfonso IV. (1325-57) was compelled to defend his kingdom against Castilian and Moslem. Alfonso's son Pedro (1357-67) was succeeded by his son Ferdinand (1367-83), the last male in the legitimate line.

On the death of Peter his illegitimate son, John I., took measures to secure the government and was recognized by the Cortes after some difficulty in 1385. This branch of the Burgundian house is sometimes known as the House of Aviz, the King having been grand master of the Order of Aviz. John's reign of nearly half a century was one of the most noteworthy in Portuguese history. He successfully defended his kingdom against Castilian attack and showed himself a statesman and general of uncommon ability. The fame of his reign rests, however, less upon the strong and intelligent administration of the King than upon the work done under the direction of his accomplished son, Prince Henry the Navigator (q.v.), in exploring the African coast with the object of discovering an eastward route to the Indies. In 1419 the Portuguese rediscovered Madeira, and at the close of John's reign they reached the Azores. A successful campaign by Portugal in Morocco, resulting in the capture of Ceuta in 1415, was followed by the acquisition of control over about half of Morocco, which was held until 1578. John I. was succeeded by his eldest son, Duarte, or Edward (1433-38), and he by his son Alfonso V. (1438-81). The work of Prince Henry's captains and their immediate successors led to the inauguration of a regular system of exploration and the acquisition soon after the middle of the fifteenth century of the Cape Verde Islands and the Guinea Coast. Alfonso V. interfered in the Cas-

tilian succession disputes (1474-76) and was severely defeated at Toro in the latter year. Alfonso was succeeded by his son John II. (1481-95), during whose reign Pope Alexander VI. issued his famous bull of demarcation (May 4, 1493), giving to Portugal all discoveries east of a meridian one hundred leagues west of the Azores and Cape Verde Islands, a decision which was modified by the Treaty of Tordesillas (June 7, 1494) between Portugal and Spain, by which the line of demarcation was moved to a distance 370 leagues west of the Cape Verde Islands. This arrangement presently gave Portugal the important territory of Brazil in the Western Hemisphere. John's successor was his cousin Emmanuel (1495-1521), the son of a younger brother of Alfonso V. His reign was notable for the voyage of Vasco da Gama around the Cape of Good Hope to India (1497-98), opening the period of Portuguese activity in the East, and for the discovery and first settlement of Brazil, which remained for over three centuries an appanage of the Portuguese crown. In 1510 Albuquerque (q.v.) captured Goa, which became the seat of Portuguese power in the East. Within a few years this great commander extended the Portuguese conquests to Malacca and the Sunda Islands. The Portuguese also established themselves at various points on the east coast of Africa and penetrated into Abyssinia and the Congo country. The reign of Emmanuel's son, John III. (1521-57), saw Portugal at the height of its prestige. It ranked as one of the most powerful European monarchies, while Lisbon was one of the most important commercial cities of the Continent.

While Portugal's rise had been rapid, its decline was more sudden still. The numerous wealthy and industrious Jews, whose able financial management had done much to establish Portuguese commerce, were expelled from the country, while social tyranny and oppression in the colonies as well as at home depressed the energy and crippled the resources of the nation. The death of King John in 1557 made his grandson Sebastian, then a child of three years, King. Drawn by his ambition for new conquests and by the restlessness of the Moors into an African campaign in 1578, the young King met a total defeat and death at Kasr el-Kebir (Alcazar Quivir). This was the beginning of the loss of the Moorish dominions of Portugal. Of the few places remaining in Portuguese control after this unfortunate campaign, Ceuta was garrisoned by Spain in 1580 and ceded to that country in 1668; Saffi was ceded to the Moors in 1641; Tangier to England in 1662; several other places to the Moors in 1689; and the last, Mazagan, in 1770. The death of Sebastian left but one representative of the old Burgundian line, Sebastian's aged grand-uncle, the Cardinal Henry, whose brief reign (1578-80) plunged the country still further into misfortunes. His death gave rise to bitter disputes over the succession between several connections of the Portuguese royal house. Of the claimants Philip II. of Spain, whose mother was a daughter of the late King Emmanuel, possessed the power and the opportunity to seize the coveted possession, which he promptly did, two battles sufficing for its conquest by the Duke of Alva. The annexation of Portugal to the Spanish monarchy subjected it to the deadly blight of Philip's state-ty and imposing tyranny; its resources were

weakened by the heavy expenses incident to the ruinous wars of Spain; and the Dutch seized most of the Portuguese possessions in the East Indies. In the reign of Philip IV. matters were brought to a crisis by the course of his minister Olivarez, and in 1640 a successful conspiracy of the higher nobility freed Portugal from connection with Spain. This was accomplished under the leadership of John, Duke of Braganza, the descendant of an illegitimate son of John I. The Duke ascended the throne, and the rule of the present reigning House of Braganza began in the person of John IV. (1640-56). War with Spain was terminated in 1668, when in the Treaty of Lisbon the independence of Portugal was formally recognized. The succeeding history of Portugal offers little that is of interest. From its high rank as a commercial power the country sank into a position of practical dependence upon England, with which Portugal became closely allied by the Methuen Treaty in 1703. John IV. was succeeded by two of his sons, Alfonso VI. (1656-67) and Pedro II. (1667-1706). To the latter's son, John V. (1706-50), succeeded his son, Joseph (1750-77). In this reign the genius and resolution of the Minister Pombal (q.v.) infused temporary vigor into the administration and checked for a time the downward tendency of the national credit. Pombal carried on a relentless war against the nobles and the clergy, and as a result of his efforts the Jesuits were expelled from the country in 1759. The year 1755 was notable for an earthquake which nearly destroyed Lisbon (q.v.). There was a speedy relapse into reaction upon the accession of Joseph's daughter Maria and her husband, Pedro III., who was also her uncle. The latter died in 1786 and three years later, owing to the mental condition of the Queen, the government was put in the care of a regency under the Crown Prince John. Prince John gave evidence of ability and patriotism. Being unable to maintain himself in Portugal against Napoleon, who by the Treaty of Fontainebleau had agreed with Spain upon the partition of Portugal, he left the country in November, 1807, with his family and transferred his Government to Brazil, while a French army under Junot occupied Lisbon. The campaigns of the English and Portuguese forces under Sir Arthur Wellesley freed Portugal of its French invaders (see PENINSULAR WAR), and in 1816, upon the death of his mother, Prince John succeeded to the crowns of Portugal and Brazil as John VI. He continued to reside, however, at the Brazilian capital until 1821.

Portugal had for several generations been under an absolute form of government, the controlling springs of which were the Court and the priesthood. The transfer of the seat of government to Brazil was a humiliation to the Portuguese, and aroused a spirit of discontent which made them especially susceptible to the revolutionary influences then alive in Europe. In 1820 the army took the lead in a revolution designed to bring in a constitutional government. King John returned to Portugal, leaving his son Dom Pedro as Regent in Brazil, with instructions to retain that country for the House of Braganza, even at the cost of separation from Portugal. The revolutionists at home insisted upon subordinating Brazil in the new arrangements and produced a revolt in the latter country. This movement Dom Pedro, loyal to the

interests of Brazil, headed, and in 1822 Brazil asserted its independence and the Prince Regent declared himself constitutional Emperor. Meanwhile in Portugal the Brazilian movement caused a reactionary revolt toward absolutism, headed by the King's younger son, Miguel (q.v.), who had been invested with the command of the army. The revolt was put down with British assistance in 1824. Upon the death of King John in 1826 his son, Pedro, Emperor of Brazil, who succeeded to the crown of Portugal, promulgated a constitution, providing for a bicameral legislature, with an hereditary House of Peers and an elective House of Deputies, its legislative powers being subject to the King's sanction. The fundamental liberties of citizens were guaranteed, and other religions than the Catholic were to be tolerated. Pedro then resigned his right to the crown in favor of his seven-year-old daughter, Maria da Gloria, who, when of age, was to marry her uncle, Miguel. The latter was made Regent in July, 1827, and in this Pedro, who was an unselfish patriot but not a politician, made his great mistake. The Regent at once took measures in defiance of the Constitution to restore the ancient forms of government. He proclaimed himself King in 1828, sought to reconcile the interests of the conflicting political parties, and at the same time place the monarchy on its old basis. In this he was supported by the Absolutists, recruited from the army and the clergy. In 1832 Dom Pedro, who in the preceding year had been forced to abdicate the throne of Brazil, proceeded to uphold the rights of his daughter by force of arms. He placed himself at the head of an expeditionary force, which had been collected by the opponents of Dom Miguel at the island of Terceira, Azores, and in July he was welcomed as a deliverer at Oporto, the Liberal stronghold. A stubborn struggle ensued. In July, 1833, the fleet of Dom Pedro, commanded by Sir Charles Napier, vanquished the Miguelist fleet off Cape Saint Vincent, and a few weeks later Lisbon capitulated to Dom Pedro, who proclaimed himself Regent for Dona Maria. Pedro was aided by the intervention of Spanish arms, backed by the influence of the short-lived Quadruple Alliance (England, France, Spain, Portugal). By the agreement of Evora, in 1834, Miguel pledged himself to a renunciation of all claims to the crown and to perpetual exile from the kingdom. Pedro died September 24, 1834, when Queen Maria was but fifteen years of age. Her reign was a troublous one. Neither rulers nor people knew how to carry on a parliamentary government. The fall of Miguel put an end to the Absolutist Party, and the political division that took the place of the old was that between Chartists and Liberals, the former upholding the existing Constitution, the latter seeking to restore the Constitution of 1822, which represented popular sovereignty. The later political history of the country has been that of a series of progressive movements originating in the principal cities and combated, usually with success, by the conservative element. A military revolt in September, 1836, forced the Queen to restore the Constitution of 1822, and gave their name to the Septembrists, who thereupon formed the Constitution of 1838, modeled upon that of 1822. Another military revolt restored the Chartists to power in 1842, and they governed the country under the leadership of Costa Cabral (q.v.) until in

1852 a new party known as the Regenerators, composed of Septembrists and Chartist seceders, came into power under Saldanha, and established direct suffrage. The Queen died November 15, 1853, leaving her husband, Prince Ferdinand of Coburg, as Regent during the minority of their son, Pedro V. The latter died November 11, 1861, having refused to flee from the cholera-stricken city of Lisbon. Ferdinand continued as Regent for the next heir, Luiz (1861-89). The autocratic methods of Saldanha split his party and finally resulted in 1877 in constituting the Progressist Party out of the more radical members of the old Liberal parties. A Republican Party came into existence in 1881 and has since been carrying on a more or less active propaganda, which was stimulated in 1889 by the success of the republican revolution in Brazil. The continued excess of expenditures over receipts and the consequent increase of the public debt has imposed a severe responsibility upon the Government and forms its most difficult problem. King Luiz died October 9, 1889, and was succeeded by his elder son, Carlos. See CHARLES I. See POLITICAL PARTIES, section on *Portugal*.

PORTUGAL. pór'tōō-gāl'. MARCOS ANTONIO (1762-1830). A Portuguese composer, born in Lisbon. He was educated at the Priests' Seminary in his native town and continued his musi-

cal education under the opera-singer Borselli, by whose influence he was appointed cembalist at the Madrid Opera in 1782. In 1787 he went to Italy, where, the following year, his first opera, *L'eroe emesc*, was produced. The slight success of his first work was compensated for by the popular favor accorded to *La bacchetta portentosa*, in 1788, at Genoa. In 1790 appeared *Il Molinaro* and *L'astuto*, both in Italy, and he was appointed Court conductor at Lisbon, but later returned to Italy. From 1799 to 1810, he conducted at the San Carlos Theatre in Lisbon, and produced a number of Italian and Portuguese operas. In 1810 he went to Rio de Janeiro, at which place he occupied the position of general musical director. In 1813, with his brother, Simão, he was appointed joint musical director of the Conservatory at Vera Cruz. In 1815 he visited Italy for the last time. He spent the remaining years of his life at Rio de Janeiro as an invalid. He composed about forty operas, five grand masses, five masses with the organ, and two Te Deums, in addition to numerous smaller works and church music. Though not among the great international composers, he holds the first place in Portuguese music.

PORTUGÁLETE, pör'tōō-gä'lä-tä. A Spanish seaport near Bilbao (q.v.).

PORTUGUESE-BRAZILIAN LITERATURE. The literature of Brazil has to some degree followed the literary tendencies of the motherland in Europe. As it was long the custom to send Brazilian youths of promise to Coimbra for their training, the intellectual relations between Portugal and Brazil were very close during the colonial period. Since the winning of Brazilian independence, however, Brazilian writers have shown no slight originality.

Four periods may be marked: (1) From the age of discovery and exploration down to the middle of the eighteenth century, a period during which the seeds of culture are sown by missionaries from Europe, especially by the Jesuits. At first Portuguese and Spanish models are followed servilely, but in the first half of the eighteenth century a slight tendency toward independence manifested itself, even though Portuguese influence still ruled supreme. (2) The second half of the eighteenth century, an age which is characterized by the endeavors of the poets of the school of Minas-Geraes, who show in certain instances a growing desire to escape from the too rigid influence of the Old World. (3) The period ranging from the beginning of the nineteenth century to about 1840, and bearing the impress of the political independence that began in 1822. (4) The epoch from 1840 on, during which the Romantic movement comes to shake the power of Pseudo-Classicism as well in America as in Europe, and the feeling of national consciousness exerts a constantly growing influence.

(1) From the settlement to the middle of the eighteenth century. The Jesuits sought as soon as possible to naturalize the literary forms popular in the old country, and composed and had performed dramas religious in their nature and based on the *Autos* of Gil Vicente and his successors. The first poet known by name is Bento Teixeira Pinto (born about 1550); he is more noteworthy for his prose *Relação do naufragio que fez . . . em o anno de 1565* than for his verse. More important than Pinto are the brothers Gregorio

and Eusebio de Mattos. Gregorio (1633-96), the better of the two, was an inveterate satirist; he closely imitated the Spanish Juvenal, Quevedo, adopting also the methods of the Spaniards Lope de Vega and Góngora. Spanish Gongorism prevailed likewise in the lyrics of Vieira Ravasco (1617-97) and Botelho de Oliveira (1636-1711); and Oliveira, like so many Portuguese of the period, wrote at least as much in Spanish as in Portuguese. Bahia, where the Viceroy dwelt, saw the greatest literary development in this first period. It was the centre of societies of men of letters, such as the *Academia Brazílica dos Esquecidos*, whose members produced much occasional verse of a panegyrical nature. The panegyrics of Brito de Lima (1671-1742) are typical compositions. We may mention the Franciscan Manoel de Santa Maria Itaparica (born 1704), whose poetical legend, *Eustachidos*, treats the well-known story of Saint Eustace, and the *Historia da America portugueza* of Sebastião da Rocha Pita (1660-1738). This is the first truly scientific and detailed account of the history of Brazil. The first distinguished dramatist of Brazilian birth now appeared in Antonio José da Silva (q.v.).

(2) Second half of the eighteenth century. The influence of Portuguese literature, itself now wholly subordinated to the precepts of French Pseudo-Classicism, continued to hold sway during this period, but the note of protest against what was fast beginning to be felt as foreign domination rang out ever more loudly both in politics and in letters. On the model of the European Academies and Arcadias, Rio de Janeiro had the *Arcadia Ultramarina* founded by the poet José Basilio da Gama (1740-95) and kindred spirits. The members of the coterie of Minas Geraes, many of them associated with the *Arcadia Ultramarina*, known as the *poetas mineiros*, headed the luckless movement for political independence which emanated from that region. To José Basilio, a master of style and harmony, is due the epic *Uruguay*, which describes the struggles of the Spanish and Portuguese troops against the Indians of Paraguay. Another worthy endeavor to compose an epic is seen in the *Caramuru* of José de Santa Rita Durão (1737-84), celebrating Diego Alvares, an early explorer of the coast of Bahia. The earliest of the lyric poets of the Minas Geraes group was Claudio Manoel da Costa (1729-90), who hanged himself in prison after the failure of the revolutionary plot in which he and his fellow poets had figured. His close friend Thomaz Antonio Gonzaga (1744-1809), the greatest member of the school and one of the most popular poets in the Portuguese speech, perished in exile. Gonzaga is best known by the pseudonym of Direen, which he assumed in his famous *Marília de Dirceu*. This collection of impassioned lyrics is addressed to his beloved (Marília). The erotic spirit also inspires the lyrics in the *Glaura* of Manoel Ignacio da Silva Alvarenga (1740-1814), who helped to found the *Arcadia Ultramarina*. Alvarenga earnestly endeavored to infuse a more national and popular spirit into the Brazilian lyric. Domingos Caldas Barboza (1740-1800), author of *cantigas, quintilhas*, sonnets, etc., and Francesco de Mello Franeo (1757-1823), who, with the aid of José Bonifácio, wrote the mock-heroic poem, *O reino da estupidez*, belong more properly to Portugal.

Tenreiro (1769-1811) imitated Horace in his odes.

(3) From about 1800 to about 1840. The fetters of Classicism were now shaken off by certain writers who advocated a wider use of Christian elements in poetic composition. Among them were Antonio Pereira de Sousa Caldas (1762-1814), known for his verse translation of the Psalms, etc.; Frei Francisco de São Carlos (1763-1829), author of the excellent epic, *A Assumpção da Santíssima Virgem*; and José Eloy Ottoni (1764-1851), who made metrical versions of the Book of Job, of Proverbs, and of the Psalms. Although their enduring fame is rather that of statesmen and scientists, José Bonifacio de Andrada e Silva (1763-1838; patriotic and political odes, etc.), Francisco Vilella Barbosa, Marquis of Paranáguá (1769-1846, love lyrics), and the Viscount da Pedra Branca (1783-1855) deserve to be mentioned here. Mythology and poetical metamorphosing mark the verse of Januario da Cunha Barboza (1780-1846; poem *O Nicteroy*), of Silverio da Paraopeba (*Fabula do Morro do Ramos*), and of Santos Titara (epic *Paraguassú*). Barboza edited the *Parnaso brasileiro*, the first important anthology of Brazilian verse. Noteworthy prose was written by the eloquent Franciscan preacher Francisco do Monte Alverne, whose family name was de Carvalho (1784-1858). The *Maximas, Pensamentos e Reflexões* of Pereira da Fonseca, Marquis of Maricá (1773-1848), and the *Diccionaria da lingua portugueza* (1789) and the *Epitome da grammatica portugueza* (1802) of Antonio de Moraes e Silva are important.

(4) Since 1840. With an enlightened monarch like Dom Pedro II. in power, letters and science grew stronger; the Emperor himself was a scientist of no mean ability, and he was a munificent patron of authors. The Romantic movement came to arouse the Brazilians to a still higher estimate of the part that the emancipated individual can play in the creation of a noble native literature. The triumph of the romantic ideas and the consciousness of national independence are signally marked in all the poetry of Domingos José Gonçalves de Magalhães, Viscount of Araguay (1811-1882). His beautiful lyrics, mostly elegiac in tone, may be judged by those contained in the collections entitled *Suspiros poeticos e Saudades, Os Mystérios, and Urania*; the poem *Napoleão em Waterloo* is deemed the best of all. Magalhães succeeds even better in his epic, for his *Confederação dos Tamayos*, celebrating in unrhymed hendecasyllable the struggles of certain Indian tribes against the Portuguese invaders, is imperishable. His dramas, such as the *Anton José* and the *Oligato*, are not so good. Of his scientific or philosophical prose there may be noted the *Factos do espirito humano*.

Manoel de Araujo Porto-Alegre (1806-79), skilled in painting and architecture, cultivated belles-lettres also, and, besides composing several comedies, he enriched Brazilian literature with the idyllic and descriptive *Brasilianas* and the epic *Colombo*. Inspired by the *Brasilianas*, Antonio Gonçalves Dias (1823-66) put forth three volumes of lyrics, viz. *Primeiros cantos, Segundos cantos e seatilhas de Fr. Antão*, and *Ultimos cantos*, as well as an epic, *Os Tymbiras*, and several tragedies (*Leonor de Mendonça, Boabdil, Beatrice Cenci*, etc.). With Araujo and Joaquim Manoel de Macedo (1820-82), he founded

the influential literary review *Guanabara*. Macedo, favorably known for his novels (*Moreninha*, etc.), tragedies (*O Cezo Colé*, etc.), and vaudevilles, wrote the excellent lyrical and descriptive poem *A Nebulosa*. Manoel Odonio Mendes (1799-1864) is esteemed for his verse translations of Homer and Vergil (*Iliada, Odysse, Eneida, Georgicas*); in his original poems pedantry obscures his merits. Romantic tenets have generally been followed by Joaquim Norberto de Souza Silva (born 1820), an indefatigable writer (lyrical *Modulaçoens poeticas*, epico-lyric *Balatas, Cantos epicos*, tales, and a prose *Bosquejo da historia da poesia brasileira* which prefaces his *Modulaçoens*); by Antonio Gonçalves Texeira e Souza (1812-61; *Canticos lyricos*, the idyllic and allegorical *Tres dias de um noivado*, and such novels as *O filho do pescador, A Providencia, Maria*, etc.); by Joaquim José Teixeira (apologues); by Pedro de Calasans; and by Silva Guimarães. The *Historia geral do Brasil* of Adolpho de Varnhagen shows talent.

Of more recent times we can hardly speak as yet with sufficient critical retrospect. As everywhere else, so in Brazil romantic doctrines have been swept away by a realistic movement. The change from an imperial to a republican form of government has also very naturally left its impress upon current literary production. Foremost among the writers of the last three decades of the nineteenth century stands Sylvio Romero, a lyric poet (*Cantos do fim do seculo, Ultimos harpejos*) and the author of critical works on ethnography, literary history, and philosophy. Out of many other forceful writers there need be cited here only the lyric poet Olavo Bilac and the novelists Verissimo, Alencar, and Taunay.

Pereira da Costa, *Diccionario biographico de Pernambucanos celebres* (Rio de Janeiro, 1882); and various studies by Romero, viz. *Estudos sobre a poesia popular do Brazil* (Rio de Janeiro, 1888), *Cantos populares acompanhados de introdução e notas comparativas* (Lisbon, 1883); *Cantos populares do Brazil* (Lisbon, 1885), *Uma esperieza, Os cantos e contos populares do Brazil* (Rio de Janeiro, 1887).

PORTUGUESE EAST AFRICA, or MOZAMBIQUE. A colonial possession of Portugal, on the eastern coast of Africa, bounded by German East Africa on the north, the Indian Ocean (mainly the Strait of Mozambique) on the east, Zululand on the south, and the Transvaal, Rhodesia, the Central Africa Protectorate, and Lake Nyassa on the west (Map: Africa, H 6). Area, 310,000 square miles. The coast is low and forms but few harbors. In the portion north of the Zambezi the country rises rapidly toward the west, where the Namuli Mountains form the principal mountain range of the colony and rise, in Namuli Peak,

to an altitude of nearly 9000 feet. In the southern part the ascent is more gradual. The chief elevations here are the Manica plateau, with Mount Doe rising to nearly 8,000 feet, the Gorangoza plateau, and the Lebombo Mountains. The principal rivers are the Rovuma, which forms part of the northern boundary of the colony, the Zambesi, the Shire, the Pungwe, the Sabi, and the Limpopo. There are, besides, many small streams along the coast. The climate of the region, except in the mountainous districts, is malarial and subject to wide fluctuations. The mean annual temperature at Quilimane, near the coast, is 85° F., ranging from 106° to 49°. The rainy season lasts from December to March.

The vegetation is tropical. The coast region yields coconuts, indigo, tobacco, coffee, and rubber. Wheat, corn, beans, sugar cane, and rice are also grown to some extent. The country possesses great mineral wealth, including gold, iron, and coal. The gold deposits are found principally in Manica, near the frontier of Rhodesia, and are exploited almost exclusively by British subjects. Iron is extracted to some extent by the Makwas. The exploitation of the mineral resources of the country as well as its entire economic development is greatly obstructed by the lack of transportation facilities and the unfavorable climatic conditions, which prevent an extensive European immigration. The Mozambique Company, organized largely with British capital, secured a royal charter for the administration of the Manica and Sofala regions for a period of 50 years beginning with 1891. The Nyassa Company controls the region between the Rovuma, Lake Nyassa, and the Lurio.

The commerce of the colony amounted in 1900 to \$18,861,189, of which two-thirds represented imports, chiefly for reexport. The imports are composed mainly of cotton goods, iron products, and beverages. The principal exports are rubber, wax, ivory, and minerals. Most of the trade passes through the ports of Lourenço Marques, Beira, and Mozambique. The colony has two railway lines, one connecting Beira with Rhodesia, 222 miles in the colony, and another leading from Lourenço Marques to the Transvaal Colony (57 miles in the colony). The colony is under the administration of a Governor-General and is divided into the districts of Lourenço Marques, Mozambique, Zambesia, Gaza, and Inhambane. The estimated revenue and expenditures for 1901-02 were \$3,064,548 and \$3,294,325 respectively. The population is estimated at over 3,000,000.

The principal tribes are the Makwas and the Ajas in the north, both belonging to the Bantu race; the Tavalas in the central part; and the Watwas, a Zulu tribe, and the Tongas, a tribe of mixed origin, in the south. The seat of administration is Lourenço Marques. The occupation of the eastern coast of Africa by the Portuguese dates from 1498, when Vasco da Gama landed at one of the mouths of the Zambezi. A number of settlements were founded along the coast during the first decade of the sixteenth century, and the military post of Tete, on the Zambesi, was founded in 1632. Slavery was abolished in 1878. The boundaries of the colony were fixed by agreements with Great Britain in 1891 and with Germany in 1886 and 1890. Consult: Andrade Corvo, *Estudos sobre as Províncias Ultramarinas* (4 vols., Lisbon, 1883-87); Oliveira Martins, *Portugal em*

Africa (Porto, 1891); Theal, *The Portuguese in South Africa* (London, 1896).

PORTUGUESE GUINEA, gín'ê. A colony of Portugal in Northwest Africa, bounded on the north by Senegal, on the east and south by French Guinea, on the west by the Atlantic (Map: Africa, B 3). The boundary with French Guinea was established by convention in 1886. Area, 14,265 square miles. Numerous islands which belong to the colony, including the Bissagos, line the coast. The shores are difficult of access. The land rises gradually from the flat coast region to the mountains of French Guinea, and is generally fertile. The Rio Grande is the largest river. In the lower part of its course it forms a wide inlet of the sea. The climate is excessively hot. The average annual temperature is 78.8° F. The rainy season is between May and November. The flora and fauna are tropical. The palm tree abounds. The forests contain a large variety of valuable woods. Rice and millet are the chief crops.

The French control the commerce. Bulama, the capital, on the island of the same name, has a safe harbor, and divides the commerce with two other ports, including Bissao. The annual foreign commerce is above \$1,100,000, the exports averaging about one-third of the imports. Ivory, wax, nuts, and India-rubber are exported. About 150 vessels, with some 60,000 tonnage, yearly visit the ports, excluding the coasting trade. The government is practically a Portuguese protectorate. There are a governor and a council. The estimated revenue for 1902-03 was \$140,400, the expenditure \$232,000. The military force is very light. The population is probably about 200,000, and consists of portions of many races, including the Fulbe. Portuguese Guinea was a bone of contention between Portugal and Great Britain between 1792 and 1870, in which latter year the United States Government as arbiter justified the claims of the former.

PORTUGUESE LANGUAGE. One of the Romance languages, or modern descendants of Latin, spoken in Portugal, Brazil, the Spanish Province of Galicia (with archaic and dialectal elements), the Cape Verde Islands, Portuguese Guinea, and other Portuguese colonies. As in the case of the sister languages, Spanish, French, Italian, etc., Portuguese is derived from the popular Latin of the Roman soldiery and colonists rather than from the classic speech of Rome. In its form it resembles the Spanish, its nearest neighbor, more than it does any one of the other Romance tongues. Its literature is much less important than that of the French, Spanish, or Italian, because it has been too largely imitative and too frequently subordinated to influences from France and Spain, and only exceptionally original in tone and content. Even the Portuguese vocabulary betrays considerable borrowing from France.

A description of the phonological conditions of the language is made somewhat difficult by the fact that the alphabetical notation is not strictly accurate from the phonetic point of view, since one and the same letter may denote different sounds. Moreover, even the most competent observers differ in their account of the various vowel and consonant elements of the speech. According to the best estimate, there seem to be

eleven vowel sounds, at least, viz. three values of *a*, one rather close, like the *a* of *father*, a second quite open, like the *a* of *malt*, and a third, slurred and indistinct in nature, but akin to the *a* of *around*; three *e* sounds, one close, another open, and a third (written *e* or *i*) indistinct in value and not unlike the French so-called mute *e* or the sound of *u* in *fur*; two *i*'s, one like the *i* of *bit* and the other like the *i* of *ravine*, this latter value being represented by the vocalic *y* and by *e*, as well as by *i*; two *o* sounds, an open and a close; and a *u* sound (denoted by *u* and *o*), approximate to the *u* of *flute*. These are all oral vowels. There occur also nasalized forms of five of them, viz. a nasalized *a* (written *ã*, *an*, or *am*), a nasalized close *e* (written *em* or *en*), a nasalized *i* (written *im* or *in*), a nasalized closed *o* (written *õ*, *om*, *on*), and a nasalized *u* (written *um* or *un*). Portuguese has a number of diphthongs. Several of these latter may also be nasalized; but the process of nasalization is not so complete in the case of either the vowels or the diphthongs as it is in French, for some trace of the nasalizing consonant (*m*, *n*) seems to persist (with a velar quality). The investigations of expert phoneticians like Vianna show the existence of no fewer than twenty-five consonantal sounds in the language. These are: *p*, *b*, a bilabial *b*, *f*, *v*, *w*, (denoted by *u* or *o* in hiatus); *m*, *t*, *d*, a spirant *d* (*d* pronounced like *th* in *the*), *l*, a palatalized *l* (written *lh* and pronounced approximately like the *li* of *filial*), a guttural *l*, *n*, a palatalized *n* (written *nh* and pronounced not unlike the *ni* of *onion*), a velar *n* (that is, the *ng* sound which ordinarily follows a preceding nasalized vowel); tongue-trilled *r* and *rr* (written *r*, *rr*, and *rh*) the latter a reinforced form of the former and both carefully pronounced; the sibilants *s* (having the value of the English *ss*, and written *s*, *ss*, *e* before *e* or *i*, *c* before other vowels and occasionally *x*), *z* (pronounced like the English *z* and written *s* or *z*), *ç* (the phonetic notation for the English *sh* sound, represented in Portuguese by *ch*, *x*, *s*, *z*), and *ç* (the phonetic notation for the sibilant sound heard in the English *azure* and represented in Portuguese by *j*, *g* before *e* or *i*, *s*, and *z*); *y* (that is *i* or *e* with a consonantal value easily acquired in hiatus); *k* (the English *k* sound, denoted in Portuguese by *c* before *a*, *o*, *u*, by *q* before *ua*, by *qu* before *e* or *i*, by *ch* in a few learned words, and by *k* in some foreign words); and finally *g* (that is the sound in the English *go*, denoted by *g* before *a*, *o*, or *u* and by *gu* before *e* or *i*). Of the consonants *d*, *t*, *n*, *l*, it should be remarked that their dental character is more pronounced than in English, as in the formation of them the tongue tends to touch the base of the upper teeth. The linking together in utterance of syntactically related words in a sentence accounts for the variations in value of certain consonants; it does so particularly in the case of the sibilants *s* and *z*. One of the most marked features of the Portuguese as compared with other Romance languages is the loss of intervocalic *l* and *n*; thus *quacs* represents the Latin *quales* and *peessoa* the Latin *persona*. The forms of the article *o*, *a*, "the," are due to the intervocalic position of the *l* in such syntactical combinations as *de-lo*, *de-la*, 'of the,' whence have resulted the forms *do* and *da*, and by a re-division of the compound *d'o* and *d'a*. In common with

Spanish, but probably to a greater degree, Portuguese shows an interchange of *l*, *r*, and *n*. A metathesis of vowels, consonants, and even whole syllables of the Latin etymon is not infrequent in the language. As a result of linking or sentence-phonetics, contiguous vowels of different words in a sentence are often pronounced in a single syllable; thus *toda a armada* becomes in rapid speech *todaymada*.

In its grammar Portuguese rather closely parallels Spanish. A great body of the substantives has the distinctive endings of *a* for feminines and *o* for masculines, corresponding to the Latin first and second declensions. There are traces of the survival of the Latin nominative case (*Deos*, *Domingos*, etc.), but the accusative is in general the norm of the Portuguese form. The sign of the plural is regularly *s*. As in Spanish, the regular verbs of the *-ere* conjugation have joined either the conjugation in *-ere* or that in *-ire*. An extremely interesting phenomenon is the appearance of a personal or inflected infinitive, which makes possible a very succinct construction, comparable to the Latin accusative and infinitive. *Partir*, for example, may be conjugated: *partir eu*, 'I to depart;' *partires tu*, 'thou to depart;' *partir elle*, 'he to depart;' *partirmos nós*, 'we to depart;' *partirdes vos*, 'you to depart;' *partirem elles*, 'they to depart;' and 'it is time for us to depart' may be rendered *tempo é de partirmos*. The earliest written specimens of Portuguese appear to be certain documents of 1192.

PORTUGUESE LITERATURE. The literature of the most westerly of the Romance lands, Portugal, was one of the latest to arrive at a consciousness of national unity and independence, and therefore one of the latest to begin to achieve a literary history. Furthermore, as a result of the somewhat sluggish and unassertive temperament of the people as a whole, Portuguese literature has been less independent than that of the sister tongues, and has been only too ready to limit itself to imitation of what had arisen within the bounds of Northern France, Provence, Italy, and especially of the near neighbor Spain. To the lack of any long-continued originality in the domain of Portuguese letters there has also contributed to a large degree the excess of sentimentality and the consequent elegiac effusiveness that mark the national character and life. So it is that the lyric spirit, with decided tendencies toward the idyllic and the bucolic, has ever predominated in Portugal. It was so at the very outset, for whereas lyric verse followed in the wake of epic verse in Spain and in France, it appeared at the very beginning of literary activity in Portugal, and the epic appeared there only three centuries and a half later, and then as the result of a consciously artistic development. And the love lyric, from which we date the rise of Portuguese literature, was not of spontaneous growth or native to the soil; on the contrary, it was an exotic that had thriven in France before it was transplanted to the more westerly land.

According to the scheme adopted by Theophilo Braga and by C. M. de Vasconcellos, six main periods may be distinguished in the course of Portuguese literary history.

(1) In the first period (1200 to 1385) the impulse to literary production came from France. The first Portuguese dynasty was founded by Burgundian nobles, in whose train there entered into the land, with their French habits and predilections, soldiers and colonists who settled on the territory regained from the Arabs during the age of the reconquest. Moreover, the constant pilgrimages to the shrine of Saint James at Compostella, ecclesiastical relations of various kinds, and royal and noble intermarriages, made the relations between France and Portugal exceedingly close. The more important literary influence at this early stage was that which entered from Southern France. The troubadours early penetrated into the western territory and met with particular favor in Galicia, a district linguistically connected with Portugal. Their strains were soon taken and reëchoed by native poets, who imitated as well as they might the love lyric, the panegyric, the satire, the debate, and the other conventional poetical forms of Provence. The high-water mark of composition in Provençal measures and according to Provençal ideals was reached in the reign of the King Dom Diniz

(1279-1325), the greatest of all the native troubadours, whose poetical gifts were inherited by his natural sons, Alfonso Sauches and Pedro, Count of Barcellos. Of these poets and some two hundred others of this period there are preserved about 2000 poems, nearly 140 of which are from the pen of the monarch himself, and not a few of them are due to courtiers such as the Chancellor Estevam da Guarda and the Admiral Gomes Charinho. We find the great body of this verse in certain Cancioneiros or song books, one set of which contains the Galician lyrics of the Castilian monarch Alfonso the Wise; three of them—the Cancioneiro da Ajuda and the Cancioneiro do Vaticano, so named from the libraries in which they are deposited, and the Cancioneiro Colocci-Braucuti, bearing the name of its present and former owners—have the poems of native Portuguese authors. Although the prevailing tone in the Galician-Portuguese literature of this age is that of the artificial Provençal lyric, there is a noticeable tendency to take up and adapt popular forms of a kind that still live on in the oral tradition of Portugal and Northern and Western Spain.

Prose composition at this time consists chiefly of translations from Latin—lives of saints, visions of the other world, etc.—and of translations and imitations of material borrowed from Northern France and already well known in Spain, such as the Charlemagne and the Arthurian stories (cf. the *Cavalleiros da Mesa Redonda*, one of the few of them that have thus far been published) and those dealing with the quest of the Holy Grail. It has been asserted that original composition of chivalrous romances began in Portugal as early as the fourteenth century; for some think that the *Amadis de Gaula*, of which the earliest form preserved is a Spanish version, was written originally in Portuguese at this time and was taken thence by Spanish translators and elaborators. (See SPANISH LITERATURE.) Historical writing is represented by the appearance of chronicles dealing with religious matters or with military undertakings (*Chronica da conquista do Algarve*) and things of political import, and by the appearance also of genealogies like the *Nobiliário* ascribed to the Count of Barcellos.

(2) The second period continues from 1385 to 1521. The time is really one of transition and evidences by the increased interest taken in the works of classic antiquity the influence of the all-pervading Renaissance movement. The best spirits begin to turn away from Provençal ideals, and, in imitation of the course pursued by the chief Spanish writers, adopt not infrequently a more serious didactic tone, which is borne out by use of the Dantesque allegory.

The bulk of the poetry of the age was produced by the *poetas palacianos* of the courts of João II. (1481-95) and Emanuel the Great (1495-1521). Garcia de Resende, one of these poets, played a part similar to that performed by Baena at the Court of Castile, by collecting and publishing at Lisbon in 1516 the verse of the numerous *poetas palacianos*. Four of the authors represented in this *Cancioneiro Geral* of Garcia de Resende merit particular mention. They are Gil Vicente, who is more remarkable, however, for the development which he gave to the drama; Christovam Falcão, whose idyll *Crisfal*—the first composition of this favorite kind in Portuguese—records his own love experiences; Bernardim Ribeiro, the author

of eclogues and of the famous *Saudades*, a work which with its pastoral and sentimental tendencies furnished the foundation of all such later productions in the land; and Sá de Miranda (1495-1558), who, although he utilizes still the older poetical forms, infuses them with a new spirit and appreciates fully, as did to a considerable degree Falcão and Ribeiro, the value of the popular pastoral exemplified by the *serranilha* and similar compositions.

In prose the most important original works are didactic or historical in their nature and there is some translation of the Latin moralists and historians. By direction of King Duarte there was composed a treatise on statecraft, entitled *O leal conselheiro*, and the Infante Dom Pedro gave expression to the experiences of an active and observant life in his *Virtuosa beneficentia*. The founder of true history writing appears in the person of Fernam Lopes, who compiled the *Chronica de Dom Fernando*, the *Chronica de Dom Pedro*, and especially the *Chronica del Rey Dom Johann de boa memoria*. Further historical accounts were provided by Gomes Eannes de Azurara, who described the conquest in Africa, by Ruy de Pina, and by Joam Alvares (*Chronica do sancto Iffante Dom Fernando*).

(3 and 4) The two periods that come next and embrace the long stretch between 1521 and 1700 may conveniently be regarded as forming one continuous period, an age of glory in its first part and one of decadence and stylistic exaggeration in its second. The path that Portuguese literature was now to take was indicated by Sá de Miranda, who returned in 1526 from his sojourn in Italy, imbued with a love for Italian humanism. Before the visit to Italy Miranda had given new life and enduring consistency to the pastoral; now, along with the sonnet, the hendecasyllable, the octave, the *terza rima*, and other Italian lyric and narrative verse forms, he introduced elements of the highly refined Italian pastoral; and, furthermore, under the influence of Bibbiena and Aristot, he produced two prose dramas, the *Estrangeiros* and the *Vilhalpandos*, which necessarily, like their Italian originals, derive from the drama of Plautus and Terence. It cannot be said that the plays of Sá de Miranda had any widespread popularity; but they indicated the way for his disciple Jorge Ferreira de Vasconcellos, who chose a national subject, and in his *Ines de Castro* gave Portugal her first classic tragedy, just as in his play *O cioso* he gave modern Europe one of its earliest character comedies. The Italian lyric measures imported by Sá de Miranda were adopted by many disciples (the *Quinhentistas*), who modeled themselves on the singer of Madonna Laura. A thoroughly popular drama was that developed by Gil Vicente (c.1470-c.1540). He derived his inspiration from the Spanish playwright Juan del Encina, but he sought his subjects on all sides, and developed them with great originality of treatment and in a wholly national spirit. A third figure of this period rendered illustrious by Sá de Miranda and Gil Vicente is the most famous of all Portuguese poets, Luiz de Camões (c.1524-79). Like those two authors, he aspired to dramatic honors, and in three early comedies (*Filodemo*, *Rei Seleuco*, and *Enfatriões*) he showed himself to be an ingenious playwright. His fame, nevertheless, rests rather upon his lyric and epic achievements. The fiery passion and sentiments of the man and

lover find expression in his various lyrics. The personal note rings out also in his glorious epic *Os Lusíadas*, filled with the spirit of national consciousness and patriotic fervor excited by a realization of the large part that Portugal had played in geographical discovery and in the conquest of territory in the distant Indies.

In the second part (1580-1700) of this long period the number of writers is legion, but the great majority of them lacked originality and force. Many *Camonistas* or disciples of Camões essay the epic, e.g. Francisco de Andrade (*Primeiro cerco de Diu*, 1589), Sá de Menezes (*Malacca conquistada*), Pereira Brandão (*Elegiada*, 1588, commemorating the disastrous campaign of Dom Sebastian), Quevedo e Castello Branco (*Affonso Africano*, 1611), Pereira de Castro (*Ulysses*, 1636), but none rise above mediocrity. The sadness and gloom resultant upon subordination to Spanish rule were not favorable to the composition of eminent or stirring epics. The tightening of the political bonds to Spain superinduced an even larger degree of servility to Castilian literary fashions and Gongorism with its formal excesses, its bombast, its studied obscurity of style, and its strained conceits, invaded Portugal. Among the lyric poets of the time are Rodrigues de Castro, Lobo Soropita, Frei Bernardo de Brito, the nun Violante do Ceo (1601-93), and Manoel de Faria e Sousa; writers of pastoral poems and romances are Francisco Rodrigues Lobo (*Primavera*, *Pastor peregrino*, and *O desencanado*), Alvares do Oriente (*Lusitania transformada*), and Manoel da Veiga Tagarro. The taint of culteranism is deplorably clear in the verse contained in the collections entitled *A fenix renascida* and *Ecos que o clarim da fama da*. A natural note is struck in the unaffected lyrics of the historian Manoel de Mello. Spanish *siglo de oro* plays held full sway on the Portuguese stage; but Manoel Coelho Rebello did produce humorous interludes in the home speech.

Composition in prose toward the middle of the sixteenth century was largely concerned with pastoral and chivalrous romances and with tales. The renowned chivalrous romance, *Amadis de Gaula*, so persistently claimed for Portugal by certain historians of her literature, was an exceedingly popular book, and it led to the writing of continuations and imitations of it, as an example of which may be cited the *Palmerin d'Inglaterra* of Moraes (1544). The *Celestina* story of Castile is somewhat less drastically copied by Jorge Ferreira de Vasconcellos in three tales, and a more native tradition appears in the tales of Fernandes Trancoso. Unfortunately for Portugal, the best pastoral poem of the age, the *Diana* of the Portuguese Jorge de Montemor, was written in Spanish. The sonorous and rhetorical qualities of Portuguese prose were excellently shown forth by Rodrigues Lobo in his *Corte na aldeia e noites de inverno*. The historians direct their attention particularly to the adventures of Portuguese heroes and arms in the Indies. The romantic side of the expeditions of exploration and conquest is made prominent in the collection termed *Historia tragico-maritima*. Other ambitious efforts are those of Barros in his *Decadas* and Albuquerque the Younger in his story of his father's deeds (*Commentarios*): personal observation guided the records left us by Pinto, by Fernam Lopes de Castanheira, and by Correia. Several chronicles register the note-

worthy events of the lives of the monarchs of the period of conquest; and a number of works of a comprehensive nature seek to furnish a general history of the fatherland. Manoel de Mello wrote most of his historical treatises in Spanish; his *Epanaphoras de varia historia portugueza* (1660) is in Portuguese. Pulpit eloquence is most ably represented by the discourses and sermons of the Jesuit Antonio Vieira (1608-97); and Portuguese epistolary style is seen at its best in the *Cartas* of both Vieira and Manoel de Mello.

(5) During the period from 1700 to 1825 French Classicism ruled supreme in Portugal. Xavier de Meneses promulgated his verse translation of Boileau's *Art poétique* and sought to apply its precepts in his tedious epic, the *Henriqueida*. The Academia Real Portugueza was founded (1721) in the hope that it would control the literary destinies of the land; but it proved to be powerless, though the coterie of poets banded together in the Arcadia became really influential. The Arcadians were actuated somewhat by the wholesome principle of combining the plastic and correct forms of French Classicism with elements derived from domestic models of the sixteenth century; but in the main the native tradition was slighted. Correa Garção and Antonio Diniz da Cruz e Silva were Arcadians who preached Horace and Boileau to their compatriots; Antonio Diniz's *Hyssope*—modeled on Boileau's *Lutrin*—is the most noted mock-heroic in Portuguese. Dramatic production is almost wholly in accordance with French rules. To the second half of the century belong its two most eminent authors, Francisco Manoel do Nascimento (1734-1819; known in the Arcadia by the pseudonym of Filinto Elysio) and Manoel Maria Barbosa du Bocage (1765-1805). Nascimento was a gifted lyric poet, with a refined and pleasing diction, which stood him in good stead also in his prose translation of Osorio's Latin history of Emanuel the Great. The poetic talent of Bocage, who founded the Nova Arcadia (in which he was styled Elmano), was even more pronounced; no Portuguese poet has surpassed him in the use of the sonnet. Both Nascimento and Bocage had followers. To Bocage's unskillful imitators is due a new form of culteranism, for which the master has been unjustly blamed and to which the term *Elmanismo* has been improperly applied. A pretentious rival of Camões was José Agostinho de Macedo (1761-1831), who has now lost a good deal of the prestige that he once enjoyed by reason of his epic *O Oriente*.

(6) The nineteenth century. The Peninsular War and the fierce struggle against Napoleonic encroachments stirred patriotic feeling in Portugal to greater activity than had been witnessed for several centuries. As everywhere else in Europe, modern liberal thought made much headway in the land, and as everywhere else the young exponents of modern scientific ideas came into conflict with the unprogressive government of the country. João Baptista da Silva Leitão, Viscount d'Almeida-Garrett (1799-1854), returned from a period of expatriation spent in England and France, imbued with the Romantic principles which he found fully established in those lands, and with the strong desire to study the past of his own country and to revive its literary traditions. Even while still in exile he composed the noble poem *Camões* (Paris, 1825), replete with patriotic fervor, the satirical poem

Dona Branca, and the versified novel *Adozinda* (London, 1828), the last named based on Portuguese folk tales. Many-sided in his endeavors, Almeida-Garrett contributed efficaciously to the creation anew of a national drama, reviving in such plays as *Um auto de Gil Vicente*, *O alfageme de Santarém*, and *Philippa de Vilhena* the older tradition of the theatre of Gil Vicente. His lyric achievements were less splendid than might have been expected, but, on the other hand, his success in the historical novel, which he essayed under the influence of Scott, amply compensates for this slight deficiency. Scott was already well known in Portugal, having been translated and even imitated by Alexandre Herculano de Carvalho e Araujo (1810-77), who passed his exile in England. Events and pictures of the reign of João I. are presented to us in his *Henrico* and his *Mongé de Cister*, and some eight centuries are covered by his *Lendas e narrativas*. A residuum of Romantic feeling along with a more pronounced tendency toward the formal methods of the Arcadians may be perceived in the lyrics of Antonio Feliciano de Castilho (1800-75). His *Ciumes do Bardo* and his *Noite do Castello* have the Romantic tinge; his *Cartas de Echo a Narciso* and later volumes like the *Excavações poeticas* and the *Outono* show stress laid rather upon Arcadian elegance and finish of outward poetical form. In recent times the drama, the historical novel, and the lyric have been cultivated by many followers of the three leading authors mentioned, and at least a moderate degree of success has been attained by Augusto Rebello da Silva (historical romances, *A mocidade de Dom Joao V.*, etc.), Mendes Leal, Silva Gayo, and especially Camillo Castello Branco (1825-90), who has the credit of having created the modern Portuguese novel of manners. An unwholesome sentimentalism prevails in the lyrics of Soares de Passos; a romantic tone as well as some of the polish of Castilho's verse can be recognized in the poems of Thomaz Ribeiro.

Although the Romantic doctrines are still professed by a number of Portuguese writers, a not unnatural reaction against the exaggerations of ultraromanticism has set in since 1865 and has found expression in the aims and utterances of writers of the School of Coimbra, an appellation which does not sufficiently indicate the expansion of the new movement. Under the influence of Hegelianism and the positivist doctrines of Comte, this movement has sought to develop a strictly scientific spirit, and to apply it to the sober investigation of the mediæval past. An encouraging sign of the success of the reform thus undertaken is the appearance of the poet João de Deus (Nogueira Ramos), the author of the lyrics *Flores do campo* (1869), *Ramo de flores*, and *Despedidas de verão*. Equally encouraging is the energy with which scientific investigation and literary study have been undertaken by persons of the ability of Theophilo Braga, Gonçalves Vianna, J. Leite de Vasconcellos, and Coelho.

PORTUGUESE MAN-OF-WAR. The popular name of certain remarkable siphonophores (q.v.) of the genus *Physalia*. The pneumatophore or float is an oblong, crested bladder, flattened on the lower side, from which are freely pendent the various individuals of the colony. The most notable of these are the long capturing filaments, which are extraordinarily fine and contractile, and are very richly supplied with the nettle-cells, so characteristic of cœlenterates

PORTUGUESE MAN-OF-WAR.
a, Swimming bell; b, crest of same; c, reproductive zooids; d, nutritive zooids (tentacles).

the most common Portuguese man-of-war in the western Atlantic is *Physalia peltagica*, which has the float six or eight inches long and two or three inches high. The float is a bright, iridescent blue, shading in some places into purple, with the lower part and edges red. The individuals of the colony are chiefly red, though various parts are blue. The float contains a gas, possibly air, which seems to be secreted by glandular epidermal epithelium at its bottom. The gas can be expelled through an air-pore, by which

the interior is always in communication with the outside. By contraction of its float, the animal can sink below the surface, to which it rises again during calm weather. Portuguese men-of-war are found chiefly in the warm seas, and in some places in the tropics large numbers are blown ashore when the wind has blown landward for an unusual length of time. They are also carried northward in the Gulf Stream, and during the latter part of the summer are often seen off the southern coast of New England.

PORTUGUESE POLITICAL PARTIES. See **POLITICAL PARTIES**, paragraph *Portugal*.

PORTUGUESE VERSION. See **BIBLE**.

PORTUGUESE WEST AFRICA. A Portuguese colony on the west coast of Africa. See **ANGOLA**.

PORTUNUS, or **PORTUM'NUS** (Lat., from *porta*, door, *portus*, port). The Roman divinity, originally of doors, then of harbors, and hence represented with a key. His festival, the Portunalia, was celebrated annually on August 17th at his temple on the Tiber.

PO'RUS (Lat., from Gk. Ἰᾶρος) (?-B.C. 317). An Indian king, the most powerful of all those conquered by Alexander the Great (q.v.). His kingdom lay in the north of India between the Hydaspes and Acesines (the modern Jhelam and Chenab), and he was a monarch of much importance and ancient lineage. When Alexander reached the Jhelam in his invasion of India in the spring of B.C. 326, he found Porus awaiting him with a strong army on the site of the modern town of Mong. After some delay the Macedonian force succeeded in crossing the river by stratagem followed by open approach, and a fierce battle ensued, in which Porus was wounded and made captive. When the conqueror retired from India in the following year, he left Porus as ruler over the lands west of the Jhelam, comprising seven nations, and in addition made him an ally of his former enemy and rival Taxiles, probably Ambhi, Raja of Takshasila. After the death of Alexander, Porus seems to have extended his power over Sindh by expelling Peithon, the Greek ruler. In 317 Porus was assassinated by Eudemus, who had been made satrap of the Punjab by Alexander to administer its affairs with Taxiles. The name Porus obviously represents the Sanskrit *Pāurava*, or member of the race of Puru, a legendary monarch of the so-called lunar dynasty, whose descendants are represented by the Sanskrit writings as dwelling in the north of India.

The same name was borne by at least two other kings, one a nephew and enemy of the great Porus. He was driven by Alexander from his country of Gandaris (Sanskrit *Gandhāra*), on the left bank of the Indus. There was also a Porus, King of Madura, who sent gifts and an embassy to the Emperor Augustus. Consult McCrindle, *Invasion of India by Alexander the Great* (2d ed., Westminster, 1896).

POR'Y, JOHN (c.1570-1635). An English colonist and geographer. He graduated at Gonville and Caius College, Cambridge, in 1592, studied history and geography for a time after 1597 under Hakluyt, and in 1600, at Hakluyt's suggestion, made a translation of the *Geographical Historic of Africa written in Arabicke and Italian by John Leo, a More*, which at that period was considered the only original authority con-

cerning North and Central Africa. From 1619 to 1621 he was secretary to Sir George Yeardley, Governor of Virginia. While in Virginia he made several excursions among the Indians, the accounts of which, in Smith's *Generall Historie*, are of historical interest. He returned to England in 1621, but in 1623 went back to Virginia as a commissioner from the Privy Council.

POSADOWSKY-WEHNER, pò'zà-dòv'skè-và'nër, ARTHUR ADOLF, Count von, Baron von Postelwitz (1845—). A German statesman, born at Grossglogau, Silesia. After studying law and political science at Heidelberg, Berlin, and Breslau, he turned his attention to agriculture in 1869 and entered the Government service, at Posen, in 1871. As a Deputy to the Prussian House of Representatives in 1882-85 he sided with the Free-Conservatives. Elected president of the province by the Estates of Posen, in 1889, he completely reorganized the administration of the province, and in 1893 was appointed State secretary of the Imperial treasury. Succeeding Bötticher as Minister of the Interior in 1897, he was entrusted with the representation of the Imperial Chancellor, and made Prussian Minister of State. The German tariff of 1902 was one of the prominent results of his administration. He is the author of a *Geschichte des schlesischen uradligen Geschlechts des Grafen Posadowsky-Wehner* (Breslau, 1891).

POSCHINGER, pòsh'ing-ër, HEINRICH, Ritter von (1845—). A German administrator and author. He was born at Munich, studied law there and in Berlin, was for some years employed in the Bavarian State service, and in 1876 entered the Imperial employ as assistant in the chancery office. Afterwards he removed to Berlin, entered the Department of the Interior, and became governmental privy councillor. He wrote: *Bankgeschichte des Königreichs Bayern* (1874-76); *Banken im deutschen Reiche, Oesterreich und Schweiz* (1877); *Bankwesen und Bankpolitik in Preussen* (1878-79); *Preussen im Bundestag* (2d ed. 1882-85); *Lasalles Leiden* 4th ed. 1889); *Bismarck als Volkswirtschaft* (1890); *Ansprachen des Fürsten Bismarck* (1894-99); and many other works on Bismarck, politics, and banking. Poschinger edited, besides many documents relating to Bismarck, *Denkwürdigkeiten des Ministerpräsident Otto Fürst von Manteuffel* (1901) and *Kinkels sechsmonatliche Haft im Zuchthause zu Naugard* (1901).

POSEIDON, pò-sí'don. See NEPTUNE.

POSEN, pò'zen. A province of Prussia, bounded by Pomerania and West Prussia on the north, Russian Poland on the east, Silesia on the south, and Brandenburg on the west (Map: Prussia, G 2). Its area is 11,184 square miles. The surface is mostly flat. There are extensive tracts of wooded marshland, now partially converted into agricultural land. Posen is watered principally by the Warta and the Netze, and to some extent by the Vistula. There are a large number of lakes and some important canals. Posen is chiefly an agricultural country. Over 60 per cent. of its area is under tillage and in gardens. In the distribution of land large holdings prevail, about 58 per cent. of the productive land being divided into estates of 250 acres and over. Rye, wheat, oats, barley, and potatoes are produced extensively and partly exported. Large quantities of

sugar beets are raised for local sugar mills. Cattle-raising is very important, and the census of 1897 shows a large increase in the live stock of the province.

The manufacturing industries are only slightly developed and employ (including all other industries outside of agriculture) only 20 per cent. of the total population. The principal manufactures are spirits (of which Posen is one of the chief producers in Germany), beet sugar, machinery, bricks, and wooden wares. The exports include grain, cattle, wood, and wool. The railway lines have a total length of over 1200 miles, almost exclusively controlled by the State. Posen is divided administratively into the two districts of Posen and Bromberg, with the town of Posen as the capital. In the Prussian Landtag the province is represented by 19 members in the upper and 29 delegates in the lower chamber. It returns to the German Reichstag 15 members. The population, in 1900, was 1,888,055, of whom about 70 per cent. were Roman Catholics. The Polish language and its dialects are spoken by the majority of the inhabitants. Posen formed a part of Poland till the first partition of that country in 1772, when Prussia acquired the districts north of the Netze. The other portion was taken by Prussia at the second partition in 1793. In 1807 it was annexed to the Duchy of Warsaw, but was restored to Prussia in 1815, receiving the title of a grand duchy. Posen has been the scene of bitter strife between the Polish and German elements, and the Prussian Government has resorted to arbitrary measures in its efforts to Germanize the region.

POSEN (Pol. *Poznan*). The capital of the province of the same name in the eastern part of Prussia, situated at the confluence of the Cybina with the Warta, 90 miles north of Breslau (Map: Prussia, G 2). It is a first-class fortress and has a strong garrison. Its appearance has been greatly improved by the building of new quarters and the construction of modern buildings. Of its numerous churches the most noteworthy are the eighteenth-century cathedral, well known for its golden chapel and for its fine monuments and the bronze statues of the first two Christian kings of Poland, the seventeenth-century parish church, and the fifteenth-century Marienkirche, the oldest church in Posen. The principal secular edifices are the old town hall, rebuilt after the fire of 1536 and adorned with a slender tower 214 feet high; the adjoining modern town hall in Renaissance; the royal palace containing the State archives; the Raczyński palace with the library of the same name; and the German theatre. Posen has a Roman Catholic and an Evangelical gymnasium, a seminary for teachers, and one for Catholic priests. The old fortifications are being demolished. The new ones comprise about 12 inner and 20 outer forts. The principal manufactured products are machinery of various kinds, spirits, flour, furniture, and cigars. There is also some trade in wood, grain, wool, and spirits. The population rose from 73,200 in 1890 to 117,014 in 1900, the increase being due principally to the annexation of adjacent rural communities. The inhabitants are principally Roman Catholics.

Posen is one of the oldest cities of Poland. It became the see of a bishop in the tenth century and was the residence of the early Polish mon-

archs. It was a member of the Hansa and attained great prosperity in the sixteenth century, but afterwards declined, its population at one time having dwindled to about 12,000. The western part of the city was founded by Germans in 1253 and had a separate administration until the annexation of Posen to Prussia in 1793.

POSEY, pō'zi, THOMAS (1750-1818). An American soldier. He was born in eastern Virginia, but removed to the western part of the colony in 1769, became quartermaster under Gen. Andrew Lewis, in Lord Dummore's War (q.v.), and took part in the battle of Point Pleasant on October 10, 1774. Early in 1775 he became a member of one of the Virginia committees of correspondence, and on July 8, 1776, helped defeat Lord Dummore at Gwynn's Island. He was appointed captain of a Virginia company March 20, 1776, joined the Continental army early in 1777, and was soon assigned to Morgan's corps of riflemen, with which he served in the campaign against Burgoyne, distinguishing himself in the battles of Saratoga. In October, 1778, as major, he commanded one of the regiments sent against the Indians in the Wyoming Valley; in 1779 he commanded a battalion under Wayne, and was conspicuous at the assault in Stony Point; and subsequently (1781-82) served under Wayne in Georgia and helped to repel an attack of Indians under Gueristersigo on June 23, 1782. In 1793 he became a brigadier-general and led a division of Wayne's army against the Indians, but resigned his commission in February, 1794. He then settled in Kentucky, and became successively State Senator, Lieutenant-Governor (1805), and major-general of militia (1809). He subsequently removed to Louisiana and was United States Senator from that State (December, 1812-February, 1813). From 1813 to 1816 he was Governor of Indiana Territory and from 1816 to 1818 was an Indian agent.

POSIDIP'PUS, or **POSEIDIPPUS** (Lat., from Gk. Ποσειδῖππος, *Poseidippus*). A Greek comic poet, the last exponent of the new comedy, dating from the first half of the third century B.C. He was born at Cassandria in Macedon, lived at Athens, and wrote 40 comedies, of which 18 titles have come down to us, and a few fragments, published in Koek, *Comicarum Atticorum Fragmenta*. His *Didymoi* ("The Twins") was the original of Plautus's *Menæchmi* and of Shakespeare's *Comedy of Errors*. It is probable that others of his plays were imitated by the Roman comedian. A remarkably fine statue of Posidippus is in the Vatican at Rome.

POSIDONIA (Lat., from Gk. Ποσειδωνία, *Posidōnia*). The ancient name of Paestum (q.v.).

POSIDONIUS (c.128-45 B.C.). A Stoic philosopher, born at Apamea, in Syria. He was a pupil at Athens of Panætius, whom he succeeded as the leader of the Stoics; and was a teacher of Cicero, who frequently speaks of him with praise. Pompey visited him B.C. 67, at Rhodes, where the greater part of his life was passed, and again B.C. 62, after the close of the Mithridatic War; and Posidonius wrote a history of the wars of Pompey. He went to Rome in B.C. 51. Besides his philosophical works, he wrote treatises on history, astronomy, and geography, of which we have only the titles and a few quotations preserved by Cicero, Strabo, and others. He wrote *Meteorologica*, and Cicero alludes to

his artificial sphere, which represented the motion of the heavens. The slight fragments from his works are published in Müller's *Fragmenta Historicorum Græcorum* (Paris, 1841-51).

POSILIPO, pō-zō'le-pō. A mountain ridge southwest of Naples, remarkable for the tunnel known as the Grotta di Posilipo, through which the road from Naples to Pozzuoli formerly passed. The grotto is in some places 70 feet high and 21 feet wide, and is 2244 feet long. Strabo assigns its construction to M. Coecilius Nerva, superintendent of aqueducts in the time of the Emperor Tiberius. Above the eastern archway of the grotto is the so-called 'tomb of Vergil.' At the base of the hill of Posilipo anciently stood the poet's villa, in which he composed the *Eclogues* and *Georgics*, if not also the *Æneid*. Since 1885 new tunnels have been built for the railroad and steam tramway to Naples. Near by is the village of Posilipo, with 4500 inhabitants. The surrounding country is rich in vineyards and olive groves.

POSITION (Lat. *positio*, from *ponere*, to place, from **po-*, down, Gk. ἀπό, *apo*, Skt. *apa*, off + *sinere*, to allow). In music, a term having reference to the arrangement of the different tones of a chord. A chord is said to be in *fundamental position* when its fundamental tone is in the bass. In its first inversion (the third in the bass) it is in its *second position*; in its second inversion (the fifth in the bass), in its *third position*. Thus *a*, *b*, *c*, and *d* are first, second, and third positions, respectively, of the C major chord. (See CHORD.) A chord is also said to be in *close position* (close harmony) when all its tones are placed so closely together that it is not possible to introduce another note belonging to that chord between those notes, as:

A chord is in *open position* (open or extended harmony) when its several tones are spread out so that one or more tones belonging to that chord can be introduced within the compass of the chord, as

(See HARMONY.) On the violin the word *position* has reference to the several systems of fingering. There are seven positions generally recognized (although for the highest tones use is made of the eleventh and even thirteenth position). The *first position* is that, when the lowest tone of the lowest string (G) is played on the open string, using the first finger for *a*, the second and third for *b* and *c*, then passing to the open D string, using the three fingers for *e*, *f*, *g*; then to the open A string, etc. The *third position* begins with the first finger on *b* (G string), the second, third, and fourth on *c*, *d*, *e*, respectively; then passing to the D string with *f* produced by the first finger, etc. (See VIOLIN.)

POSITION-FINDER. See RANGE-FINDER.

POSITIVISM (from OF. Fr. *positif*, from Lat. *positivus*, settled by arbitrary appointment, from *ponere*, to place). A term invented by Auguste Comte (q.v.) to designate his system of philosophy, inasmuch as that system purported to exclude all metaphysical theorizing and to confine itself to 'positive' scientific knowledge of facts. It attempted to reduce the whole universe

to experiential terms, excluding supernatural and spiritual agencies, hidden forces and immaterial essences, and causation regarded as a mysterious tie binding phenomena together. Instead of causes it looked for laws, i.e. the uniformities of coexistence and sequence among phenomena. When a certain uniformity has been discovered, no reason can be assigned, it claimed, for that uniformity. The uniformity is a fact given us by our experience, and reasons for facts do not exist. Though Comte invented the term positivism, he was not the first positivist. Indeed, views more or less fundamentally like his can be discovered in Greek philosophy, especially among the sophists. In modern times Hume (q.v.) deserves to be called a positivist by reason of his view of causation, although with Hume the reign of natural law was a subjective rather than an objective fact. This subjectivism differentiates him from the prominent positivists of to-day. Kant's philosophy in recent times has also given rise to a school of thinkers in Germany who are one with Comte in throwing aside all considerations of metempirical character and in confining all scientific knowledge to phenomena and actually observed relations between phenomena. Prominent among these German thinkers are Laas (q.v.), Riehl (q.v.), T. Ziegler, and F. Jodl. Allied with these are such thinkers as Schuppe, Rehmke, and Averarius, all differing from each other, but insisting that the task of philosophy is to state the highest laws of experience, and all denying that there is anything behind experience. In England the tendency of positivism has lately been to appeal to the feelings by the establishment of a church with ritual, ceremonies, and the like, all in the worship of humanity. This tendency has its point of departure in Comte's religion of humanity. The leaders of this movement have been R. Congreve and Frederic Harrison. Of the last generation Lewes (q.v.) was the English protagonist of positivism, but he was interested more in its philosophical than its religious side. In France E. Littré and H. Taine have been the most noted positivists, while Renan was greatly influenced by Comte's doctrines. For bibliography, see the article COMTE, AUGUSTE. Croly), *A Positivist Primer* (New York, 1871); Balfour, *The Religion of Humanity* (Edinburgh, 1888); Fouillée, *Le mouvement positiviste et la conception du monde* (Paris, 1896); Huxley, "Scientific Aspects of Positivism," in his *Lay Sermons* (London, 1871); Laas, *Idealismus und Positivismus* (Berlin, 1879); Fiske, *Outlines of Cosmic Philosophy* (Boston, 1874); Gruber, *Der Positivismus vom Tode Auguste Comtes bis auf unsere Tage* (Berlin, 1891).

POSO. See CHICA.

POSSE (pōs'sè) **COMITATUS.** A legal term, meaning power of the country. As used in military law it refers to the employment of the army to aid in enforcing the laws. Such use is forbidden by statute except in cases where it is expressly authorized by the Constitution or by Congress (20 Stat. L. 152). The army regulations prescribe the manner in which troops shall be employed to aid the civil authorities as a posse comitatus or in execution of the laws of the United States.

POSSESSION, LAW OF (Lat. *possessio*, from *possidere*, to possess). Possession is primarily a matter of fact. It is the control by a person of a tangible thing. The degree and kind of control necessary to constitute possession vary with the nature of the thing possessed and the habits of the community. He who controls a thing as owners of things usually control them is possessor of the thing.

Possession is quite independent of any legal right to possess. A thief possesses the thing he has stolen; and the person who has surreptitiously or by force placed himself in control of a house possesses the house.

ADVANTAGES OF POSSESSION. To the possessor as such, without regard to his right to possess, every legal system, even in the highest stage of development, accords certain advantages. The possessor is protected against every one who has no better right than himself. He is protected against disturbance (trespass), and if wrongfully dispossessed he recovers possession simply on the ground of his prior possession and the wrongfulness of the dispossession. Even when his adversary has a superior right to possess, the possessor may be protected against forcible dispossession.

Further, possession is, as the English lawyers express it, a 'root of title.' At Roman law ownership cannot be acquired without acquisition of possession, although when acquired it survives the loss of possession. Finally, in every system of law possession ripens by prescription (q.v.) into full property right.

LEGAL POSSESSION. In determining to what persons, and under what circumstances, the legal advantages above indicated shall be accorded, every legal system develops a more or less artificial doctrine of possession. Persons having physical possession without the legal advantages of possession are not legal possessors; in civil-law terminology they are 'detentors.' On the other hand, persons not having physical possession, but enjoying the legal advantages accorded to possession, are termed 'possessors.' In some cases one person is treated as legal possessor as regards protection against disturbance and against dispossession, while another person is regarded as possessor for the purposes of prescription.

The law of possession is less clearly developed in the English law than in the Roman and modern civil law. This is due partly to the fact that the English law employs the same actions, viz. trespass, ejectment, and trover, for the protection of possession and for the enforcement of property right, while the Roman law has distinct possessory remedies. In their practical operation, however, the two systems attain substantially similar results.

In both systems (as indeed in every legal system) the person who has physical control of a thing and holds it for himself—the person who, as the Roman jurists express it, has both the *corpus* of possession and the *animus possidendi*—is a legal possessor. Those who hold for others are differently treated in different systems. In no legal system are they possessors as regards prescription; but as regards protection against disturbance and against dispossession distinctions are drawn. Servants and employees acting under the direction of a master or employer are generally regarded as mere detentors. Agents,

bailees, and lessees are not possessors at Roman law; but in the modern civil law and in English law they have possessory remedies, at least against strangers, and they are therefore usually called possessors. If, as is usually the case in modern law, possessory remedies are also given to those for whom they hold possession, the latter (principals, bailors, and lessors) are said to have 'constructive' or 'mediate' possession. Pledges and mortgagees who have physical possession are treated as legal possessors in every system of law.

The denial of possessory remedies to the person who holds for another does not exclude the right of defending physical possession against wrongful aggression. It signifies simply that if judicial proceedings are necessary, they must be taken by (or at least in the name of) the person for whom the property is held.

A very important rule of pleading which is contained in the Code Napoléon is that every physical possessor is presumed to possess for himself and with good title until the contrary is proved.

One of the chief differences between Roman and English law is found in the greater protection which the Roman law gives to the possessor of a movable against the person who has the right to possess. At Roman law, if the owner takes property forcibly from the possessor, he is obliged to restore it and pay damages; he cannot justify his employment of force by showing his right to possess. (It must be remembered, however, that at Roman law bailees and agents are not possessors.) At English law the owner of goods is permitted to use reasonable force for their recapture, even against a third person who has acquired them innocently with color of title. As regards realty the statutes against 'forcible entry' have placed the English law on nearly the same footing as the Roman.

DEFECTIVE POSSESSION. He who has acquired possession from another person by force or by stealth or by license is said, in the Roman and modern civil law, to have a possession which is 'vicious' (i.e. defective). As regards that person he is protected against forcible dispossession, but not against disturbance (trespass). As against all other persons, however, vicious possession enjoys (as at English law) the same protection as any other kind of possession.

HONEST POSSESSION. To the *bonæ fidei* possessor, i.e. to the person who not only possesses, but believes that he has a right to possess (a belief which regularly implies color of title), Roman and modern civil law give greater advantages than to the *malæ fidei* possessor. The honest possessor, when evicted by the owner, is not accountable for *fructus* or mesne profits no longer in his possession; or, as the civilians express it, he has the right of consumption and even the right of waste. Again, the honest possessor alone may acquire title by prescription. Finally, the honest possessor has an action for recovery of possession which runs against all the world, by which he prevails over every possessor who has not at least as much color of title as he has, and which, unlike the ordinary possessory remedies, is not limited to a brief term. These distinctions are generally drawn in modern civil law, but not in English law. In English law the honest possessor is accountable for mesne profits; he has no advantage as regards the perfecting of his title by lapse of time; and the actions of

ejectment and trover may be employed by the dishonest possessor as well as by the honest possessor. In these English actions, however, the relatively better title prevails, so that substantially the same result is reached as in the Roman law.

ACQUISITION AND LOSS OF POSSESSION. In order to acquire legal possession a much more complete control must be established when the thing seized was not previously in any one's possession (as in the capture of wild animals, birds, and fishes), or when the thing is taken without the consent of the prior possessor (disseisin), than is necessary in cases where possession is voluntarily transferred by a prior possessor. In case of delivery of possession it is only necessary that the new possessor gain the degree of control ordinarily held by an owner. Thus, while the theft of a key would not give the thief possession of anything but the key, the delivery of a key may suffice to transfer possession of a box or a room or a house. Such cases are sometimes described as 'symbolic' deliveries, but this term is inaccurate, since control actually passes.

At English law a further distinction (foreign to the Roman law) is drawn between the person who has a right to possess and the person who has no such right. He who has a right to possess becomes legal possessor, even without the consent of the prior possessor, as soon as a partial control is established. This is one of the meanings attached to the English maxim that 'possession follows title.' Another meaning is that, when it is uncertain who has the physical control, legal possession is with the person who has the better right to possess.

Legal possession is lost, at all legal systems, when physical control is lost. Control, however, as previously stated, does not mean complete control; and possession once established usually continues until the possibility of control is lost. Apart from the case of animals *feræ naturæ*, this usually occurs only when an adverse possession is established.

POSSET (probably from Ir. *pusoid*, posset, Welsh *posel*, curdled milk, from *posiaw*, to gather). A dietetic preparation, made by curdling hot milk with wine, ale, vinegar, or other acidulous liquor. White wine or sherry is generally preferred, or old ale may be used. The posset is made by adding to boiling milk the liquor chosen: One and one-half wineglassfuls of sherry, or twice this quantity of ale to one pint of fresh milk, are the proper proportions. A teaspoonful of vinegar or of lemon juice may be used instead, and the mixture sweetened.

POSSEVINO, pòs'sà-vè'nò, ANTONIO (c.1534-1611). An Italian Jesuit and Papal diplomat, born at Mantua. He studied at Rome, was appointed secretary to Ereole Gonzaga, in 1559 entered the Jesuit Order, and was later rector of the Jesuit College at Avignon. In 1577 he was despatched to Sweden for the purpose of effecting the return of that country to the Roman

communion. Though King John III. gave assurance of obedience to the Pope, an ecclesiastical commission at Rome failed to accede to many of the King's propositions, and the monarch discontinued negotiations. In 1581 Possevino received credentials as Papal ambassador to Poland and Russia, the Pope having been appealed to by Ivan IV., the Terrible, to serve as arbiter. He aided in accomplishing peace (1582), but failed in his attempt to obtain the consolidation of the Greek and Roman Churches. He did, however, secure religious freedom for Roman Catholic merchants, and safe conduct for Papal nuncios and missionaries. Subsequently he was active as ambassador and missionary, and in 1587-91 lectured at the University of Padua. In addition to numerous controversial writings, he published *Moscovia, sive de Rebus Muscoviticis* (1586), containing a narrative of his own embassy; *Bibliotheca Selecta de Ratione Studiorum* (1593); and *Apparatus Sacr* (1603-06), an extensive and painstaking, though not uniformly critical presentation of the sources of general theology.

PÖSSNECK, pös'nöck. A town of Saxe-Meiningen, Germany, situated 54 miles southwest of Leipzig (Map: Germany, D 3). It has a Gothic church of the fourteenth century, and a Gothic town hall. The chief manufactures are woolen and leather goods, porcelain, and dyes. Population, in 1900, 12,266.

POST, ALFRED CHARLES (1806-86). An eminent American surgeon. Born in New York City, where he passed all of his life with the exception of two years, Dr. Post was graduated from Columbia College in 1822, and from the College of Physicians and Surgeons, New York City, in 1827; studied in Paris, Vienna, Berlin, and London, 1827-29; was demonstrator of anatomy in College of Physicians and Surgeons, New York City, 1831-35; professor in the Castleton Medical College, Vermont, of ophthalmic surgery, 1842-44, and of surgery 1844-51; professor of surgery in New York University, 1851-75, and emeritus professor of same, 1875-86; president of medical faculty of same, 1873-86; attending surgeon to New York Hospital, 1836-52; consulting surgeon to same 1852-86; consulting surgeon to Saint Luke's Hospital and attending surgeon to the Presbyterian Hospital, and president of the medical board of the Women's Hospital, in New York City. He was a Fellow of the Academy of Medicine, of which he was vice-president 1861-66, and president 1867-68. He was also vice-president of the American Medical Association. Dr. Post published several orations delivered before medical bodies, and also *Observations on the Cure of Stammering* (1841). He was also the inventor of several surgical instruments and appliances. His son, GEORGE E. (1838—), a physician and botanist, was born in New York City. He studied art, medicine, and theology, and became professor of surgery in the Protestant Syrian College at Beirut. There he became distinguished both as a physician and as a botanist. He wrote and translated many books, one of the most important being *Flora of Syria, Palestine, and Sinai*.

POST, WRIGHT (1766-1828). Born on Long Island, N. Y.; studied medicine for six years in New York and London, and commenced to practice medicine in New York in 1786. In 1792 he became professor of surgery, and afterwards of

anatomy and physiology, in Columbia college. He visited the celebrated schools of Europe, and returned in 1793 with a splendid anatomical cabinet. In 1813 he became professor of anatomy in the College of Physicians and Surgeons, and was its president 1821-26. He was for 30 years consulting physician of the New York Hospital, and a member of the prominent literary societies of the city.

POSTAGE STAMPS (from *post*, from Fr. *poste*, from ML. *postu*, station, fixed place on a road, from Lat. *postus*, *positus*, p.p. of *ponere*, to place). Printed labels issued by individuals, corporations, or governments, acting as carriers of letters or packages, to signify that the charges demanded by them for forwarding this mail matter have been prepaid. The postage due or unpaid letter stamp is not a postage stamp, but is merely a convenient means of indicating that a certain amount is due for a carrier's service which has been rendered. An individual or corporation may, in countries where the law allows it, establish a carrier service between different points and issue stamps for the prepayment of charges. This was the origin and use of United States local stamps, which the laws at one period allowed, but now forbid. The suspension of the United States mail service in the neighborhood of San Francisco in 1894, on account of a railway strike, produced a brief evasion of

the law in the establishment of a bicycle mail route between Fresno and San Francisco. The postage on mail by this route was prepaid by a twenty-five-cent stamp. Such a local arrange-

ment has but little authority and is accorded scant recognition. A higher grade is reached in the semi-official issues whose originators were, in such cases as those of the Baltimore carriers, authorized by the United States Government to charge one cent for the delivery of letters at the post-office. Postmasters' stamps have even more of authority.

The United States Government, being unwilling to undertake the risk and expense of a general issue of postage stamps, allowed, in 1845, the postmasters of certain towns and cities to issue stamps at their own expense and for their own convenience to test the feasibility of their use. The postmasters of Alexandria, Va.; Brattleboro, Vt.; Lockport, N. Y.; Millbury, Mass.; Baltimore, Md.; New Haven, Conn.; New York, N. Y.; Providence, R. I.; and Saint Louis, Mo., adopted

the plan with such success that the Government undertook, in 1847, a general issue to supersede all the individual postmasters' issues.

The highest authority pertains to government issues, and consequently universal recognition is accorded to them. A sharp distinction, however, is made between established governments and pseudo-governments. The attempts of the Cuban Revolutionary Committee to raise revenue from stamps manufactured and sold in New York, which never prepaid an ounce of Cuban mail, and of Aguinaldo in the Philippines to foist labels issued by his unrecognized government upon the collecting public, met with small success.

There are two kinds of stamps, the adhesive and those which are impressed upon the envelope or wrapper.

Adhesives are attached to packages before mailing. The only exception to this is found in the case of some United States newspaper stamps. The newspaper set of 1865 was attached to packages of newspapers, but the stamps of 1875 and following years were attached to the stubs of receipt books, the receipts being given to publishers of second-class mail matter sent through the mails at pound rates to show the amount that had been paid by them. The use of these stamps was finally judged superfluous and discontinued. Official stamps are used by government office-holders to indicate the amount of postage that would have been paid had their mail matter been sent at the usual rates. No money, however, having been paid for these, they are in the nature of official franks, but a nominal value is usually given them, the idea being to use them as a means of keeping the accounts between the different departments of government.

The history of postage stamps begins with the issues made by Great Britain in 1840, under the administration of Sir Rowland Hill. The successful use of stamps in the postal service of

Great Britain resulted in the adoption of stamps by Mauritius, an English colony, by Brazil, France, Switzerland, and the United States before 1850. The example was followed by many other countries, and since 1860 nearly all have adopted the postage stamp as the most convenient means of indicating the prepayment of postage on mail matter. The establishment of the Universal Postal Union, by means of which the rates of international postage, the colors of the stamps to be used, and the regulations for forwarding are determined, has given great impetus to the issuing of stamps throughout the world.

The earliest shape of the postage stamp is practically that which is in use to-day. The triangular, diamond-shaped, octagonal, and square have been tried as experiments by different countries, but in nearly all cases the return has been made to the rectangular form, and usually to about the same size as that of the original issue of Great Britain. Sizes have differed very greatly, the smallest, a stamp of Bolivar, a State of the Colombian Republic, being three-eighths by one-half inch, and the largest the United States newspaper stamp of 1865, $2\frac{1}{4} \times 3\frac{3}{4}$ inches.

The original designs of the stamps of many

countries are their finest; but there are notable cases in which the improvement both in design and workmanship has been remarkable. A prominent example of this is found in the various issues for Uruguay. The earliest types, those of 1856-66, are of the most inferior workmanship, and the stamps are produced by the cheapest processes known. Stamps of the next decade show some improvement, while those of the following years contain some of the finest work of the period, and also a number of specimens of poor work. The stamps since

1884, however, have been the finest possible examples that could be turned out under modern processes of engraving, and reveal from year to year the advances that have been made.

The methods of manufacture have changed very greatly since postage stamps were first issued. The earliest stamps, in several countries, were each engraved separately by hand, upon copper plates from which the impressions were taken. A notable example of this is the postmasters' stamps issued in Saint Louis. This small plate of six stamps was engraved in two vertical rows of three stamps each, the first row of the 5-cent and the second row of the 10-cent

denomination. The two upper 5-cent stamps were altered to 20-cent stamps and later these were changed back to their original 5-cent denomination. Separate engraving was also employed in the cases of the early stamps of Mauritius, New South Wales, and the Philippine Islands.

The first adhesive stamp issued, the one-penny black of Great Britain, was made by a more advanced process. The original steel die, having been hardened, was impressed a number of times upon a softened steel roller which in turn was hardened, and under pressure rolled upon a plate from which the stamps were printed. By this means of transfer, as many impressions could be made on a plate as desired, and the full sheets of these early issues contained 240 stamps.

This method of engraving and transfer, with some improvements, is employed at the present time and is utilized in the manufacture of the stamps of many countries. Another method in use has been the setting of separate electrotypes of a stamp side by side and then recasting them as a solid plate. Lithography has also been employed as a convenient and cheap method for producing stamps in quantity. Some countries have also made stamps by the use of ordinary type and rule, the design being repeated as many times as it was desired to have stamps in the sheet. Type-set stamps vary one from another.

This is caused by slight differences in the type or its spacing, and in the cutting of the rule used for borders.

The common method of printing envelope stamps is by embossing, there being in this case two dies, one fitting into the other; the paper being placed between these and the flat surface of one die inked, a stamp is produced in which the raised portions are white and the level portions are inked. This method has been employed

in the printing of a few adhesive stamps, notably those of Great Britain of the issue of 1841.

Provisional issues of stamps have been made from time to time in different countries. This has sometimes been done for the purpose of providing a new denomination for immediate use before it

was possible to obtain a new supply of the stamps from the printers. Such provisionals are usually made by over-printing some values of stamps of which there is a surplus with a new value. This is known as surcharging. Sometimes lithography is resorted to in countries where the regular issues are engraved. Surcharging is also resorted to in order to increase the supply of some denominations and to decrease that of others for which there is less use than had been expected when the stamps were printed.

There was no means employed when the earliest issues of stamps were made to provide for their easy separation. The stamps were intended to be cut apart, and in many cases were printed very close together. The use of a machine for punching small holes between the stamps, known as a perforating machine, was begun in 1854, although there are instances, even at the present time, in which no method of separation is employed. Another method of separating stamps is by the use of the rouletting wheel, which cuts through the paper between the stamps with a series of small cuts such as would be made by brass rule, with an edge made up of alternate dashes and spaces, in printing. This rule also is sometimes used for the same purpose, and when it is inked the stamps thus treated are spoken of as rouletted in colored lines. The cuts are, in certain cases, made in zigzag or saw-tooth form and are variously produced by rouletting wheels or by impressions with rule made for cutting.

Governments which have issued stamps sometimes reprint them after they have gone out of use. When these issues are good for postage they are called reissues. When, however, they are obsolete stamps, which cannot be used for prepaying mail matter, they are known as reprints. It sometimes happens that the plates of Government issues of stamps get into the hands of private individuals who reprint them for sale to collectors. These are known as private reprints and are of much less value than Government reprints because made without authority, and usually in large quantities.

The processes employed in printing in many countries have been such as to encourage counterfeiting. Comparatively little trouble has been experienced by governments which have employed steel engraving for the production of their

stamps. The expense and difficulty of successful imitation by the use of counterfeit steel plates has been such as to deter counterfeiters from attempting it. The lithographic process is usually employed by counterfeiters. The Government of Spain changed its issues every year for a considerable period in order to defeat the aim of counterfeiters. Greece also has suffered considerably from counterfeits made to defraud the Government.

The collecting of stamps, sometimes known as philately, has several advantages over the gathering of other objects which satisfy the collecting instinct. The chief of these is the small space which is occupied by a large and valuable collection. There is also a standard of value by means of which the worth of stamps may be estimated. This is found in the standard catalogues, which, being based upon a knowledge of the number of stamps in existence, and prices collectors are willing to pay for them, contain approximate valuations for most of them.

The separate engraving of stamps increases very much the interest in them. It has also led to a distinct kind of collecting known as plating. Collectors who are interested in doing this seek to restore the original plates of stamps by gathering together all the varieties that have been printed from them and placing them in their proper order in relation to one another.

Great countries are distinctly adverse to the use of the postal service in any other than its legitimate manner. There have been cases where British and French colonial authorities have arranged for special issues of stamps or have had overprints, known as surcharges, placed upon them for the purpose of securing an increased sale to collectors, but these attempts have been frowned upon and few of them are made at the present time.

All collectors of stamps collect the perforated as distinct from the imperforate issues. The rouletted varieties are quite generally collected, and those who are especially interested in the smaller varieties notice the differences in the gauge of the perforation. This is determined by the number of holes that may be counted in the space of two centimeters and a stamp is known as perforated 11, 13, 15, etc., according to the number of perforations included in that space.

Water-marks have been used by many countries as a means of guarding against the counterfeiting of their stamps. These are produced in the paper in the same way that the water-mark is made in ordinary writing paper. It sometimes appears in the centre of a sheet or pane of stamps,

and again the whole water-mark is found in the space covered by a single stamp. The most common and interesting varieties of water-mark are those found in the stamps of Great Britain and her colonies. It is sometimes quite difficult to discern the water-mark, but a stamp placed in benzine upon a black surface usually shows it clearly. Collectors who are especially interested in minor varieties of water-mark collect them when found inverted or sideways in the stamp, as well as in their proper position. The misplacing of a sheet in the press frequently causes a water-mark to appear at one side instead of at

the centre of a stamp, and in some cases it is entirely lacking for this reason, and, where the margin of a sheet contains lines or large letters, these are found in the stamps.

The colors of the paper on which stamps are printed appeal strongly to all collectors, also the quality of the paper itself. Laid paper is a variety showing parallel lines, similar to those of the water-mark, such as may be found in many varieties of writing paper. All paper that does not have laid lines is known as wove, some of it being of even texture and showing no marks whatever, while other varieties show that which is similar to the weaving of cloth which gives the name. Collectors who are specialists note the differences of hard and soft paper. Thin and thick paper varieties are also collected.

The value of stamps depends, not, as is commonly supposed, upon their age, but upon the number that have been issued and the number preserved. Great countries, like the United States and the principal nations of Europe, issue large numbers of every stamp that they put into circulation. The stamp which corresponds to the ordinary letter rate in any large country is al-

ways common. Very old issues of small countries whose postal service was limited attain high value. Confederate postmasters during the War of Secession issued stamps of a class similar to United States postmasters' stamps. Some of these in fine condition are rare, bringing

James M. Buchanan
5 Cents.

\$500 each and upward, according to their condition. The United States Baltimore stamp of the 10-cent denomination, which differs from the 5-cent only in the numeral, is one of the rarest known. The first issue of Mauritius brings a very high price, exceeding \$2000 for a fine specimen. All early issues of stamps are continually increasing in value, for the supply of them is limited and the demand grows constantly.

There are very valuable collections of stamps held in all the principal countries of the world. The British Museum owns one which was left to it by a late member of Parliament and which contains very fine specimens of the rarest stamps of all countries. The most complete collection in the world is owned in France. The actual value of these collections is difficult to estimate, as they contain stamps of which few specimens are known and varieties which are unique.

Consult: Calman and Collin, *Catalogue for Advanced Collectors* (New York, 1902); Luff, *The Postage Stamps of the United States* (ib., 1902); Wright and Creeke, *The Adhesive Stamps*

of the British Isles (London, 1899); Krätzsch, *Permanentes Handbuch der Postfreimarkenkunde* (Leipzig, 1895 et seq.).

POSTAL SAVINGS BANKS. The system of savings banks conducted by various governments through the Post-Office Department. This institution has become increasingly important since it was first introduced in England in 1861, and to-day all the principal nations of the world, except Germany and the United States, have adopted it. Its adoption in England was due to the inadequate facilities and incompetent management of the trustee banks. In 1860, out of a total of 638 of these banks, 350 were open only one day in the week, and then for only a few hours, while 20 towns and 14 counties, each containing over 10,000 inhabitants, were wholly without savings facilities. Similar conditions existed in the countries of Continental Europe. Thus in France Leon Say estimates that prior to 1875 34,000 communes were without any savings bank facilities whatever.

While differing in details in the various countries, the general features of the system are the same. Deposits may be made by any person at any post-office. Depositors are provided with pass-books in which the amount of the deposit is entered by the local office, and within a few days an official receipt is mailed to the depositor from the general office. In rural communities carriers are allowed to receive deposits. To encourage employees to extend the system, Holland, Finland, and Russia allow local officials commissions upon pass-books issued and deposits entered. Most countries provide for a minimum and maximum deposit. The minimum is usually about 20 cents, but a card is issued upon which stamps may be affixed until they amount to that sum, when the card is taken by the bank and the deposit is credited. This device has been found especially adapted for use in schools. In England and France the fund representing the aggregate deposits is invested in Government bonds. In other countries a wider latitude of investment is permitted, such as municipal and corporation bonds, real estate mortgages, and even personal security. The deposit is in all cases guaranteed by the Government. Interest on deposits is computed annually, the usual rate being 3 per cent. The maximum deposit is £200 in England and 1000 lire in Italy. If this sum be exceeded no interest is allowed on the excess. Withdrawals, like deposits, may be made from any post-office. A delay of a few days is usually necessary for withdrawal, though a system of withdrawal by telegraph has been provided.

Postal savings banks usually serve two other functions besides receiving deposits. These are: (1) the providing of annuities and the writing of life insurance; (2) serving their customers as agents in purchasing Government securities. Austria and Hungary have gone a step further and provided for accounts subject to check.

In England 18.43 per cent. of the total number of depositors are artisans; 8.14 per cent. tradesmen and assistants; 8.61 per cent. domestic servants; 50.41 per cent. married women, widows, spinsters, and children. In Austria more than half the depositors are under twenty years of age. Details of the various systems are shown in the following table:

	Year adopted	Date of statistics	Number of banks	Number of depositors	Total deposits	Maximum individual account	Maximum deposit any one year	Rate of interest
England	1861	1900	£122,365,193	200	50	2.5
Scotland					£5,126,299			
Ireland					£8,058,153

* Unlimited. The above table is compiled from statistics in the Statesman's Year Book (1902), and from figures given by Hamilton and Wanamaker.

Consult: Wanamaker, *Postal Savings Banks* (Washington, 1891); United States Post-Office Department, *Annual Report* (Washington, 1892); Hamilton, *Savings and Savings Institutions* (New York, 1902).

POSTEL, pô'stêl', GUILLAUME (1510-81). A French philologist and mystic, born in Dolerie, Normandy. He was poor and without patronage for many years, but by constant study he became versed in Hebrew, Greek, and Arabic. Francis I. sent him to Constantinople to buy Oriental manuscripts, and on his return to France (1539) appointed him to a chair in the Collège de France. But the idea of converting the world had taken possession of him and through the remainder of his life gave him little rest. His vagaries increased and he became disciple to an old Italian mystic, whom he calls 'Mother Jeanne' and whose spiritual dominion he prophesies. Professor in Vienna for a time, he then wandered through Italy, being repeatedly imprisoned by the Inquisition, and on his coming back to France was shut up in the Monastery of Saint-Martin-des-Champs. Postel brought to France many valuable manuscripts, and in 1555 published the first edition of the Syriac New Testament. His *De la république des Turcs* (1540; revised 1560) has some historical value. Consult Weill, *De Postelli Vita et Indole* (Paris, 1892).

POSTER. A sign, usually pictorial, intended to be affixed to a wall or board to convey some public announcement. The use of such signs is probably as old as civilization itself; but with the printing-press came in a class of signs more or less answering to the specific modern use of the word poster. In Paris in the seventeenth century, posters printed on colored paper of one tone, such as yellow for the Opera House, green for the Comédie Française, and red for the Comédie Italienne, were generally used. The custom is continued in Paris of the nineteenth century, where white paper is reserved for governmental posters, and even the great national educational establishments have to use another color, generally yellow. In Italy the play bills were more descriptive, and in the eighteenth century they were often ornamented with cuts, showing scenes and characters in the Opera. As early as 1836 in France Lalancé made a poster for the book *Comment meurent les femmes*, and Raffet, Grandville C. Nanteuil, Gavarni, Gigoux, Vernet, Daumier, Tony Johannot, Frère, and Edouard

Manet designed 'affiches' or posters, but not in colors. The modern poster was the invention of Jules Cheret. He commenced his long series of lithographs in color in 1866, and since then the art of poster designing has reached a high development. In France it has maintained a high standard, and the work of Cheret himself is notably clever and audacious. By the use of few colors in strong contrast, he produced the most fantastic pictorial effects. His subjects are ballet girls, clowns, or children, and his spontaneity, his engaging gaiety, and the aptness of his detail make him without an equal in his restricted domain. Less suggestive, less conquering in color, but more decorative if more subdued, is the work of Eugène Grasset (1850—). Another more original poster maker is the often harshly realistic Toulouse-Lautrec, a powerful draughtsman. The poster has kept pace with the impressionistic, the symbolistic, the realistic, and the romantic movements in literature and art. Willette, Forain, Guillaume, Auriol, Ibels, Steintlen, Mucha, Revière, Boutet de Monval, and Schwaebé, are only a few names among the many poster designers who have worked in one or more of these styles. Another interesting phase of the poster is seen in those designs which serve also for book-covers; the whole design, picture, lettering, and borders, given first as a poster three feet by two, and afterwards reduced to the size of an octavo page. These were first made by Cheret for Jules Lévy, the publisher, and the often artistic work done for the publishers of music. In England the first artistic poster was made by Fred Walker for the dramatization of Wilkie Collins's *Woman in White* (1871). Afterwards Herkomer, Van Beers, Walter Crane, Dudley Hardy, and Grieffenhagen, among others, won fame in this line. But the most original of English poster makers was Aubrey Beardsley, who influenced a crowd of imitators by his masterly exotic art. The 'Beggartaff Brothers,' Poryde, and Nicholson, with their grave artistic effects in black and brown, are the most interesting of the very modern designers. The growth of the poster in other European countries was rapid, especially during the years from 1895 to 1900. The Spanish posters, especially those announcing bull-fights and fairs, are models of brilliant coloring and vivid treatment. The first American posters advertised the circus and the stage, and one of the earliest of these poster makers was Matt Morgan, for some time head of a Cincinnati lithographing company. The makers of patent medicines then

LAURIER OBJETS D'ART

took it up, and from the lowest kind of pictorial art have lately done much effective work. In America bill posting has assumed enormous proportions, but actually pictorial work, especially in colors, is not as common as in Europe. (See ADVERTISING.) The most artistic American posters have been produced for the publishers in the form of enlarged magazine covers, as stated above, together with advertisements for books, and calendars, and in these as in nearly all American art the main influence is French. It was not until 1889 that the work of Louis Rhead became known, and along with him must be mentioned Penfield, Will Bradley, Carqueville, George Wharton Edwards, Parish, and Low. Although as a purely artistic production, a subject for collectors and students, the poster has had its day, yet as a medium of advertisement and of political appeal it may have a future. Consult: Maindron, *Les affiches illustrées* (Paris, 1895); id., *Les maîtres de l'affiche* (Paris, 1896); id., *Les affiches étrangères illustrées* (Paris, 1897); Hiatt, *Picture Posters* (London, 1895); Spielman and others, *The Modern Poster* (New York, 1895); Spousel, *Das Moderne Plakat* (Dresden, 1897); Bolton, *The Reign of the Poster* (Boston, 1895).

POST-GATE, JOHN PERCIVAL (1853—). An English classical philologist, born at Birmingham. He was educated at King Edward's School, Birmingham, and at Trinity College, Cambridge. He became fellow and classical lecturer in Trinity College and professor of comparative philology in University College, London, and editor of the *Classical Review*. His publications include editions of Catullus, Propertius, and Lucan. He became editor-in-chief of the *Corpus Poetarum Latinorum* in 1893.

POSTHUMOUS CHILD (Lat. *postumus*, *posthumus*, last, superlative of *posterus*, later; associated by popular etymology with *post*, behind, after + *humus*, ground). One born after the father's death, or delivered from the mother by the cesarian operation after her death. Such a child is regarded by the law, for the purposes of inheritance, and taking property by will, as if it had been born before the parent's death. Where a father makes a will without making provision for a posthumous child, the child is entitled to receive the same share of the estate that he would have taken if the father had died intestate, the will being revoked *pro tanto*, and the provisions for the other children or legatees being reduced proportionately to make up his share or portion. See SUCCESSION; WILL.

POSTHUMUS. The husband of Imogen, in Shakespeare's *Cymbeline*, banished by the King, who intended his daughter for his step-son Cloten. In Italy Posthumus made a wager with Iachimo on Imogen's fidelity, and, deceived by a trick, ordered Pisanio to murder her. Finally Iachimo confessed, and Posthumus was pardoned.

POSTLUDE (from Lat. *post*, behind, after + *ludus*, play, from *ludere*, to play). An instrumental selection played after the conclusion of Divine service, while the congregation is passing out of the church. The term *postlude* is also applied to the closing instrumental measures at the end of a vocal composition.

POST MORTEM (Lat., after death). A legal term employed to denote an examination of a

dead body to determine the cause of death. Usually, some dissection or mutilation of the body is necessary, but this rests in the discretion of the examining physician. A coroner is required to hold a *post-mortem* examination of the body of a person dying under suspicious circumstances. A person other than a public officer in the performance of his duty has no right to dissect or mutilate a dead body, without the consent of the nearest relative of the deceased, and is liable in damages if he does so without such consent. Consult Perley, *Mortuary Law*.

POST-MORTEM EXAMINATION. See AUTOPSY.

POST-NUPTIAL CONTRACT. In its broadest sense, any contract made between husband and wife. As to their privileges and restrictions in this respect, see CONTRACT; HUSBAND AND WIFE.

POST-OFFICE. A public institution for the reception and delivery of letters, newspapers, books, and such other matter as may by law of the State be intrusted to the mails for conveyance. The post-office is frequently also charged with other duties than the handling of mail. Thus in the United States it issues money orders designed to facilitate the transmission of money, and in European countries it conducts savings institutions and has a monopoly of the facilities for telegraphic communication. The postal service is at present in all civilized countries under the management and control of the Government. The name originated in the posts (from Lat. *positum*, placed, fixed) placed at intervals along the roads of the Roman Empire where couriers were kept in readiness to bear dispatches and intelligence. The first letter-post seems to have been established in the Hansa towns in the early part of the thirteenth century as a means of facilitating commercial intercourse. In England a system of posts for dispatching letters was early provided, Sir Brian Tuke being mentioned as the first Master of the Posts in the reign of Henry VIII. In the reign of Elizabeth a chief postmastership was established, Thomas Randolph being the first incumbent. With the accession of James I. to the throne of England and the consequent increased intercourse between England and Scotland a marked improvement in the postal system followed. In the reign of Charles I. a monopoly of letter-carrying was established, the rates of postage being fixed at from 2d. to 6d. for a single letter, according to distance, in England, 8d. to Scotland, and 9d. to Ireland. In 1680 a penny post was established for the conveyance of letters and parcels between different parts of London and its suburbs. In the reign of Anne the existing postal statutes were repealed and the post-office establishment placed on a new basis. A general post-office was instituted at London for the British dominions, with chief offices at Edinburgh, Dublin, New York, and other places in America, while the whole system was placed under the control of a postmaster-general with power to appoint deputies for the chief offices. Near the end of the eighteenth century coaches were substituted for riders on horseback. With the development of the railway system came the carriage of letters by train instead of by mail-coaches; and one novelty which arose out of this change was the adoption of traveling post-offices,

forming part of the mail-train, where letters are arranged during transit, and which sometimes receive and drop the letter-bags while the train is going at full speed.

In 1812 the rates of postage on letters were fixed at 4d. for 15 miles, with a regular increase up to 17d., which was the charge for any distance over 700 miles. In 1837 a plan of post-office reform was suggested by Mr. (afterwards Sir) Rowland Hill, the adoption of which not only immensely increased the utility of the post-office, but changed its whole administration. Its principal features were the adoption of a uniform and low rate of postage, a charge by weight, and prepayment. The new system came into full operation in 1840. A penny was adopted as the uniform rate for every inland letter not above half an ounce in weight. Facilities for prepayment were afforded by the introduction of postage stamps, and double postage was levied on letters not prepaid. Arrangements were made for the registration of letters; and the money-order office, by a reduction of the commission charged for orders, became available to an extent which it had never been before. The immediate result of these changes was an enormous increase in the amount of correspondence, arising in part from the cessation of the illicit traffic in letters, which had so largely prevailed before; but for some years there was a deficit in the post-office revenue. Since 1897 the rates have been as follows when prepaid: Not exceeding 4 ounces, 1d.; over 4 ounces and not exceeding 6 ounces, 1½d.; over 6 ounces and not exceeding 8 ounces, 2d., and so on at the rate of one halfpenny for every additional two ounces. A letter posted unpaid is charged double postage. Letters insufficiently stamped are charged double the deficiency on delivery. Redirected letters are charged additional postage at the prepaid rate; and this may either be prepaid or charged on delivery. Letters for officers, soldiers, or seamen on actual service abroad are redirected without charge. The same privilege extends—with several restrictions—to such letters redirected at home. By paying ½d. extra, letters may be posted in the boxes attached to mail trains, in which sorting is performed.

The home and foreign mail-packet service was, in the seventeenth and eighteenth centuries, in the hands of the post-office authorities, but was removed to the Board of Admiralty, under whose control it remained till 1860, when it was again restored to the post-office. Steam-vessels were first used for conveying the mail in 1821; and in 1833 mail contracts were introduced, the first being with the Mona Steam Company to run steamers from Liverpool to Douglas in the Isle of Man. Of the home mail-packet contracts, the most important are those with the City of Dublin Steam-Packet Company for conveying the Irish mails between Holyhead and Kingstown. The principal foreign contracts are for the Indian and Chinese mails, entered into with the Peninsular and Oriental Steam Navigation Company, the mails to North and South America, the West Indies, the Australian colonies, and the Cape.

In 1901 there were 22,189 post-offices in the United Kingdom besides 33,590 road and pillar letter-boxes. The total number of letters delivered during the year was 2,323,600,000, as against 1,097,000,000 in 1879. The total number of post cards, books, newspapers, and parcels

delivered through the mails amounted to 1,400,200,000. The number of money orders issued was 13,263,567, with an aggregate value of £39,374,665. The number of 'postal orders' issued amounted to 85,390,029, with an aggregate value of £29,881,726. The total receipts of the post-office exclusive of the income from the telegraphic service was £13,995,470, while the expenditures were £9,064,903, leaving a balance of £3,930,567.

The postal service of the United Kingdom is now under the immediate control of the Postmaster-General assisted by the chief secretary of the post-office in London, a financial secretary, and four other secretaries. There are also chief officers in Edinburgh and Dublin, with secretarial and other departmental staffs. The Postmaster-General is a member of the Privy Council, and sometimes a Cabinet Minister. He is the only officer connected with the department who leaves office on a change of Ministry. The secretary is his responsible adviser. The receiver and accountant-general keeps account of the money received by each department, receiving remittances from branch and provincial offices, and taking charge of the payment of all salaries, pensions, and items of current expenditure. The surveyors are the connecting link between the metropolitan and provincial officers, each postmaster, with some exceptions, being under the superintendence of the surveyor of his district. In 1900 the staff of officers employed in the post-office, including those engaged in telegraph work, was over 167,000.

POSTAL SAVINGS BANKS. See under that heading.

POST-OFFICE INSURANCE. The system of post-office insurance, first established by the English Government through the Government Annuities Act of 1864, like the system of postal savings banks, was primarily intended for the promotion of habits of thrift among the working people. For many years the Government had sold terminable annuities for one life, two lives, or a term of years, through the Commissioners for the Reduction of the National Debt. The act of 1864, which went into effect April 17, 1865, provided for the sale of such annuities of any amount between £4 and £50 through the Post-Office Department. It further authorized the Postmaster-General to insure the lives of persons between the ages of 16 and 60 inclusive for any amount between £20 and £100. But little advantage was taken of the provisions of the act, only 6524 contracts for life insurance having been entered into up to 1882. In that year the act now in force was passed. By its terms annuities, either immediate or deferred, are issued to persons not less than 5 years of age for any amount between £1 and £100. Insurance, either life or endowment, may be taken out by any person between the ages of 14 and 65 inclusive. The amount of the insurance may vary from £5 to £100. Insurance for £5 may be taken out on the lives of children from 8 to 13 years of age. Insurance for £25 or less may be issued without a medical examination, provided the insured presents other satisfactory evidence of good health. Such policies provide, however, that, if the insured dies within two years of the issuance of the policy, the beneficiary shall not receive the full amount of his policy. Premiums may be paid in a lump sum in advance, or in installments. In 1896 new premium rates were

established, somewhat lower than those before in force. The present rates are a little higher than those of the regular life insurance companies, but on the whole somewhat lower than those of industrial companies.

The connection between the insurance department and the savings banks is the most characteristic feature of the institution. Every policyholder must be a depositor in the postal savings bank. He must deposit the full amount of his first premium, opening an account if he has not one already. Later premiums the Postmaster-General transfers from the deposits of the insured so long as they hold out, without notice from the insured. The insured may make his deposits in the bank at any time, and in any amounts, subject only to the general regulations of the bank. In the same way payments to the insured, whether arising from annuities or from endowment insurance policies, are first credited to his account on the books of the bank. Furthermore, the deposits in the bank, and the withdrawals from it, may be made at any one of the 13,000 postal savings banks in the country.

In spite of the more liberal conditions established by the law of 1882, the amount of life insurance business transacted by the Government is very small. Since the new law went into effect the number of policies issued has averaged less than 800 a year. The failure of the scheme is probably to be attributed partly to the great popularity of the Friendly Societies, partly to the rigidity of the Government system and its limited number of policy forms, partly to the lack of active effort to push the business through paid canvassers or otherwise, and partly to the antipathy of the English working people to Governmental institutions of this character. The experiment has had one beneficial result, however, if, as seems to be the case, fear of the competition of the Government office has been partly responsible for the efforts the Friendly Societies have been making in recent years to establish their business on a sound financial basis.

TELEGRAPHS. An act of 1870 empowered the post-office to acquire the existing electric telegraphs; and the telegraphic communication of the country is now in the hands of the post-office. As a result of governmental control the rates charged have been greatly reduced and the number of messages sent greatly increased. Since 1885 the charges have been half a penny per word, with a minimum charge of sixpence for each telegram. Above 89 millions of telegraphic messages were sent in the year ending March 31, 1901, about ten times the number sent in 1870. The gross revenue was £3,459,353; working expenses, £3,812,569. By an act of 1898 the Post-Office Department was further authorized to assume control of the telephone service of the United Kingdom.

A fee of 2d.—in addition to the ordinary postage—prepaid in stamps, secures careful handling of any letter, newspaper, or book-packet, and renders its transmission more secure, by enabling it to be traced from its receipt to its delivery. Letters may be registered for a fee of twopenny to any place in the British colonies, and for various rates of charge to different foreign countries. Letters containing coin, if not registered, are treated as if they were, and charged on delivery with a registration fee of eightpence; the same fee is

charged on letters marked 'Registered' and posted in the usual way instead of being given to a post-office servant. For the fiscal year 1899-1900, 16,256,852 letters were registered in the United Kingdom. Recently a system of insurance against loss or damage to letters has been established. The registration fee of 2d. entitles the sender to compensation up to £5, a fee of 3d. £10, and so on up to £120. Still more recently a railway and express letter service has been established by which letters may be intrusted to the railroad companies for dispatch upon payment of an additional fee.

NEWSPAPER, BOOK, AND PARCELS POST. Newspapers and books may be sent through the mails at the rate of one halfpenny for every 2 ounces or fraction of 2 ounces. Newspapers to come under the definition must be published at intervals not exceeding seven days and appear in unstitched sheets. Under book post are included manuscripts, maps, prints, and circulars. In 1900 the number of newspapers carried aggregated 167,800,000, and the number of book packets, circulars, etc., was 732,400,000. The parcels post was established in 1883. In 1897 the rates were made 3d. for parcels not exceeding 1 pound, and 1d. for each succeeding pound up to 10 pounds. During the fiscal year ending March 31, 1900, 75,448,000 parcels were carried for £1,580,508.

FREE DELIVERY. Prior to the American Revolution no provision had been made for free delivery except in a few of the larger cities and towns. Since then the free delivery system has become universal throughout the Kingdom. Corresponding to the American special delivery is the express delivery service of the British post-office, by which letters are sent out by express messengers in advance of the postman. The total number of deliveries of this kind in 1899 was 720,381. Rural free delivery service has been extended to all parts of England and is almost completed in Scotland and Ireland.

MONEY ORDERS. As far back as 1792 a money-order office as a private venture had been established for the transmission of small sums of money to different parts of the Kingdom. By an act passed in 1838 this business was incorporated in the Post-Office Department, but the commission charged was so high that it was only employed to a very limited extent. Inland money orders may be obtained at any of the post-offices of the United Kingdom, on payment of the following commission: For orders not exceeding £3, 3d.; over £3 and not exceeding £10, 4d. Money orders may now be issued to the colonies, to most European countries, the United States, Egypt, etc., the commission being about three to four times the above rate. A money order in the United Kingdom becomes void if not presented for payment before the end of the twelfth calendar month after that in which it was issued. Orders drawn on France or Italy must be paid within three months. The lower rates for inland money orders entail a loss on each transaction. Provision was further made for the issue of ten classes of 'postal notes' for small fixed sums, under the Post-Office Bill of 1880.

THE UNIVERSAL POSTAL UNION. In October, 1874, a conference of representatives from all the States of Europe, the United States, and Egypt was held at Berne, and resulted in the establishment of an international postal union with a

central office at Berne, which meets every three years to consider questions affecting the postal relations of the States concerned. This was followed in June, 1878, by the Treaty of Paris, signed or subsequently adhered to by all the parties to the former treaty, with the addition of British India, the colonies of France, Spain, Holland, and Portugal, various British colonies, Persia, Japan, Liberia, Brazil, Peru, Mexico, in fact every country in the world except China, the new convention receiving the name of the 'Universal Postal Union.' Under this important treaty all the consenting nations were declared to be "a single postal territory for the reciprocal exchange of correspondence." Instead of the varying rates theretofore prevailing, equal rates, weights, and rules were established, and considerable reduction of postage followed its adoption. Except in the case of lengthy sea transit, a uniform rate of 25 centimes (5 cents) was adopted for a letter of 15 grams ($\frac{1}{2}$ ounce); of 10 centimes (2 cents) for post-cards; of 5 centimes (1 cent) for packets of print, etc., of 50 grams (2 ounces); and of 25 centimes (5 cents) for registration in Europe, and 50 centimes (10 cents) for registration beyond Europe. Prepayment of postage is required except on letters.

UNITED STATES. In the English colonies of America before 1639 such postal facilities as existed were supplied by private enterprise. Letters from abroad were delivered at the wharf to those who called for them or sent to a near-by coffee-house for distribution. In 1639 the General Court of Massachusetts took the first step toward the establishment of a Government postal system by enacting the following decree: "It is ordered, that notice be given that Richard Fairbanks, his house in Boston, is the place appointed for all letters which are brought from beyond the seas, or are to be sent thither, to be left with him; and he is to take care that they are to be delivered or sent according to directions; and he shall be allowed for every letter a penny, and he must answer all miscarriages through his own neglect in this kind, provided that no man shall be compelled to bring his letters thither except he please." In Virginia each planter was required to convey the dispatches, as they arrived, to the next plantation, and so on. In 1672 the Government of New York established a monthly mail to Boston. In 1683 and in 1693 post-offices were established in Pennsylvania and New Hampshire respectively. In 1692 the Legislature of Virginia passed an act reciting that one Thomas Neale had been empowered by letters patent from William and Mary to take charge of the postal business of the colonies. Neale's patent authorized him "to erect, settle, and establish offices in America for the receiving and dispatching away of letters and packettes" and to appoint the necessary persons to assist him. This patent created for the first time an American inter-colonial postal service. In general its charges for carrying a letter ranged from 4d. to 15d., according to distance. The post roads were generally in bad condition; the riders were frequently untrustworthy, and the postmasters are represented as being little better.

No man in America was so identified with the interests of the colonial post-office as Benjamin Franklin. In 1737 he was appointed postmaster of Philadelphia. In 1753 he received with Wil-

liam Hunter a royal commission as Deputy Postmaster-General for the colonies. Franklin immediately proceeded to systematize the department and personally made a tour of inspection, in which he visited every post-office in the country except that of Charleston, S. C. After four years of his administration the post-office yielded the salary of the postmasters, and a small revenue besides, and in 1774 a clear annual revenue of £3000 to Great Britain. In 1753 the delivery of letters by the penny post was begun, and also the practice of advertising letters remaining in the office in Philadelphia. In 1774 Franklin became obnoxious to the British Government, on account of his connection with the petition for the removal of Governor Hutchinson from Massachusetts, and on January 31st of that year he was dismissed from the Deputy Postmaster-Generalship. By this time the patriotic movement which concluded in the Revolution was in full tide, and so great was the feeling caused by Franklin's dismissal that private arrangements were made for carrying letters, and after 1774 the American post-office never again contributed a farthing to the British treasury. In fact, in 1775 the colonies combined to establish their own post-offices and to pay the necessary officials, the Continental Congress appointing a committee to devise a postal system, which went into effect July 26, 1775, when Benjamin Franklin was unanimously appointed Postmaster-General, with authority to establish a line of posts from Falmouth, Me., to Savannah, Ga., and as many cross posts as might seem to him necessary. During the period of the Revolution the postage was paid in currency; but this depreciated so much in value that it was ordered that only specie should be received. In 1792 rates of postage were fixed which remained unaltered for nearly half a century. They were: for 30 miles and under, 6 cents; over 30 miles and not exceeding 60 miles, 8 cents; over 60 and not exceeding 100 miles, 10 cents; and so on up to 450 miles and over, for which the charge was 25 cents. On account of these expensive rates, comparatively few letters were sent through the mails, it being found cheaper to send them by private express. In 1845 the rates were lowered and a scale based on weight as well as distance was adopted. The postage on letters not exceeding $\frac{1}{2}$ ounce in weight was fixed at 5 cents for any distance not exceeding 300 miles; over 300 miles it was 10 cents, with an increase of rate for every additional half ounce in weight. The rate on newspapers was nothing for distances under 30 miles; for over 30 miles and under 100, one cent was charged; over 100 miles, if beyond the borders of the State, the charge was $1\frac{1}{2}$ cents. In 1851 the rate on letters not exceeding $\frac{1}{2}$ ounce in weight was reduced to 3 cents for distances under 3000 miles and 6 cents for distances above 3000 miles. If not prepaid the rates were 5 and 12 cents respectively. Prior to 1851 no reduction was made for prepayment of postage. In 1855 a law was passed requiring prepayment, and this has continued to be the rule. In 1863 the element of distance as a factor in fixing the scale of rates was abolished and a uniform rate of 3 cents was established for letters not exceeding $\frac{1}{2}$ ounce in weight. In 1883 this rate was reduced to 2 cents.

STAMPS. In 1847 adhesive postage stamps were first introduced into the United States, but, on account of the high rate of postage and the pro-

vision allowing optional prepayment, they did not come into general use until 1855, when the rates were reduced and prepayment required. In 1852 stamped envelopes were introduced and in 1872 postal cards were authorized. In 1879 double or reply postal cards were authorized, and in 1898 private mailing cards were allowed to be sent through the mails at the rate of one cent postage, subject to certain restrictions prescribed by the Postmaster-General.

CLASSIFICATION OF MAIL MATTER. Domestic mail matter is arranged into four classes. The first class includes letters, postal cards, and all matter wholly or partly in writing, whether sealed or unsealed (except manuscript and corrected proof). The rate on all matter of this class is two cents an ounce or fraction thereof. On postal cards it is one cent each, the price for which they are sold. On 'drop letters' the rate is two cents an ounce at free delivery offices and one cent elsewhere. The rule is prepayment except where the amount of the postage exceeds two cents, in which case if the weight does not exceed four pounds the excess of two cents may be called for from the addressee. Second-class matter includes newspapers and other periodical publications issued as often as four times a year, which bear a date of issue and are numbered consecutively and issue from a known office of publication, and which are in the form of printed sheets without substantial binding. The rate of postage on second-class matter when sent by the publisher from the office of publication, or by a news agency to actual subscribers or to other news agents, is one cent a pound or fraction thereof. To actual subscribers within the county in which the paper is published postage is free except at free delivery offices. To all other persons than publishers and newsdealers the rate of postage on second-class matter is one cent for four ounces or fraction thereof to any place in the United States, Porto Rico, Guam, Philippine Islands, Canada, and Mexico. Third-class matter includes books, circulars, pamphlets, and other matter wholly in print (not included in second class), proof-sheets, corrected proof-sheets, and manuscript copy accompanying the same. By act of July 24, 1888, seeds, bulbs, roots, scions, and plants are also mailable at third-class rates. The rate of postage on third-class matter is one cent for each two ounces or fractional part thereof, to be fully prepaid by postage stamps affixed thereto. Fourth-class matter includes all not embraced in the first three classes which is not in its form or nature liable to destroy, deface, or otherwise damage the contents of the mail-bag or harm the person of any one engaged in the postal service and not above the weight prescribed by law. The rate of postage is one cent an ounce or fraction thereof, to be prepaid by ordinary stamps. No package of third or fourth class matter weighing more than four pounds will be received for conveyance by mail except single books. Destructive articles, obscene and scurrilous matter, lottery circulars and tickets are excluded from the mails, and the Postmaster-General is empowered by Congress to direct any postmaster to withhold mail addressed to any person or firm conducting a business which he is satisfied is a fraudulent one.

REGISTERED LETTERS. By an act of 1855 provision was made for a system of registration by

which extra precaution is taken in the transmission of valuable letters and parcels upon payment of a fee of eight cents in addition to the regular postage. The postal officials take special care of such letters, but the Government, until recently, refused to assume responsibility for such letters when lost. By an act of 1897, however, provision was made for indemnifying persons who lose registered letters and parcels of value, but the limit of indemnity is \$25 or the actual value of the article where that is less than \$25. In 1898, in more than 15,000,000 pieces of registered mail, there were but 504 cases of actual loss.

MONEY ORDERS. In 1864 the postal money order system was adopted, by which one is enabled to transmit money through the mails by making a deposit of the amount with the postmaster and receiving an order on the postmaster of the place to which the money is to be sent. No single money order for more than \$100 may be issued. The fees charged range from five to thirty cents, according to the amount sent. For international money orders the fees range from 10 cents to \$1.

FREE DELIVERY. The system of delivering mail by carriers at the houses and offices of persons to whom it is addressed was first introduced on a small scale in 1863. In 1865 free delivery was extended to all places having a population of 50,000, and such other places as in the opinion of the Postmaster-General might seem expedient. In 1873 the system was extended to all places of 20,000 inhabitants and over, and in 1887 to cities of 10,000 inhabitants or whose postal receipts amounted to \$10,000. Provision was also made in 1885 for special or immediate delivery of letters within certain limits upon the payment of a fee of 10 cents in the form of a special stamp. In 1896 an experiment of delivering mail to inhabitants of rural districts was tried. The results were so satisfactory that the system has been largely extended. In 1902 there were 11,650 established free delivery routes in the United States and preparations were being made to add many more.

PARCELS POST. In the United States there is no distinct parcels post as in England, parcels being conveyed through the regular mails as fourth-class matter. Arrangements, however, exist with Mexico, certain of the West Indies, and certain Central and South American countries providing for a parcels post between the countries concerned.

THE FRANKING PRIVILEGE. The privilege of sending and receiving mail free of postage was once enjoyed by the President of the United States, Vice-President, heads of departments, Senators and Representatives, and other officials of the Government during their official terms. An act of 1873 this privilege was conferred on all ex-Presidents and widows of ex-Presidents. By an act of 1873 this privilege was abolished, but by later acts it was conferred on all officers of the Government in the case of official correspondence. In 1895 the privilege was voted to members of Congress for their official correspondence.

GROWTH OF THE POSTAL SYSTEM. The growth of the postal business in its various branches has been almost phenomenal. The following table shows by decades the increase in the number of offices, receipts, and expenditures from 1792 to the present:

YEAR	Number of offices	Receipts	Expenditures
1792.....	195	\$67,443	\$54,530
1802.....	1,114	327,044	269,866
1812.....	2,610	649,208	540,165
1822.....	4,709	1,117,490	1,167,572
1832.....	9,205	2,258,570	2,266,171
1842.....	13,733	4,546,849	5,674,752
1852.....	20,901	6,925,971	7,108,459
1862.....	28,875	8,299,821	11,125,364
1872.....	31,863	21,915,426	26,658,192
1882.....	46,231	41,883,005	40,482,021
1892.....	67,119	70,930,475	76,980,846
1902.....	75,924	121,848,047	124,809,217

The largest items of expenditure were for transportation of the mails on railroads, compensation of postmasters, free delivery service, compensation of clerks, and transportation of the mails on the star routes. From 1880 to 1898 the population of the country increased 50 per cent., while the volume of postal business increased 150 per cent. In 1845 the total number of pieces of mail handled in the United States did not exceed 29,000,000. During the year 1902 the number of pieces of mail handled amounted to over 8,000,000,000 of ordinary mail, besides 22,831,400 pieces of registered matter. During the same year 41,785,438 domestic and international money orders were issued, having a face value of \$336,525,752. The total number of postage stamps, stamped envelopes, postal cards, etc., was 6,061,456,127, having a total value of over \$112,000,000. Consult: Lewins, *Her Majesty's Mails* (London 1864); Joyce, *History of the Post-Office* (London, 1893); *British Postal Guide and Post-Office Handbook*; Cushing, *Our Post-Office* (Boston, 1893); *American Postal Guide, Annual Reports of the Postmaster-General*. See POSTAGE STAMPS.

POST-OFFICE CLERKS OF THE UNITED STATES, UNITED NATIONAL ASSOCIATION OF. An association of post-office clerks in the classified service, whose principal object is to eliminate favoritism and political influence in the promotion of clerks by bringing the promotion as well as appointment of first and second class post-office clerks under the provisions of the Civil-Service Law. It seeks also to improve the working rules and discipline of post-offices in such matters as irregular hours of labor, imposition of fines for mistakes, etc. The association is not affiliated with any labor organization. Its principal work is carried on by a legislative committee, which is endowed by the Constitution with full power to act in all matters pertaining to legislation. The association was organized in New York November 14, 1899, and was incorporated under the laws of Maryland January 25, 1900. It is composed of 11 State associations and about 225 branches, with an aggregate membership, excluding duplicates, of nearly 10,000 persons. Its official organ is the *Postal Clerk*, published monthly at Chicago, Ill.

POST-TERTIARY PERIOD. The same as Pleistocene period (q.v.).

POSTULATE. See AXIOM.

POTASH. See POTASSIUM; SODA.

POTASH SALTS. See POTASSIUM.

POTASSIUM (Neo-Lat., from *potassa*, potash, from Eng. *potash*, from *pot* + *ash*). A metallic chemical element first isolated by Sir

Humphry Davy in 1807. The carbonates of potassium and of sodium, undistinguished from each other, were called *alkali* by the alchemist Geber, and they were known as *fixed alkali* in order to distinguish them from ammonium carbonate, known as the *volatile alkali*. Duhamel, in 1736, discovered that the alkali contained in common salt is different from that contained in the ashes of land plants, and thenceforth the first-named was called 'mineral alkali' and the second 'vegetable alkali.' In 1758 Marggraf showed that the salts of the common alkali gave a violet tinge to the flame of a spirit lamp, while those derived from common salt showed a yellow color. Klaproth next pointed out that the 'vegetable alkali' was contained also in several minerals, such as leucite, subsequent to which the special name of *potash* was applied to this alkali, and that of *natron* or *soda* to the mineral alkali. Both of these alkalies remained undecomposed up to the time of Davy's experiments. (See CHEMISTRY.) Davy decomposed potash by passing the electric current from a voltaic pile of 200 plates through a piece of potash placed in a platinum dish, the result being the formation of "small globules having a high metallic lustre, some of which burned with explosion and bright flame as soon as they were formed, and others remained and were merely tarnished and finally covered by a white film which formed on their surfaces," and these, he concluded, were the peculiar "inflammable principle, the basis of potash."

Potassium is not found native, but is widely distributed, in combination, especially as the chloride and sulphate, in sea water and other natural waters; also as a constituent of many silicates, as the feldspars and micas, forming from 1.7 to 3.1 per cent. of the granite composing the earth's solid crust. As *sylvite* (potassium chloride) and as *carrollite* (potassium and magnesium chloride) it occurs in the beds overlying the salt deposits of Stassfurt, Germany; and as nitre or the nitrate it is found as an efflorescence on the soil, usually with the sodium salt, in Chile, Peru, etc.; also as *alunite* (hydrous sulphate of potassium and aluminum), occurring in the older rocks, where its formation is attributed to the action of sulphurous gases. It is found as bitartrate in wines, and as sulphate, carbonate, and chloride in molasses from beets. As chloride and carbonate, or as an organic salt, it occurs in soils and in vegetable and animal substances; wood ashes and the ash of marine plants contain much potassium carbonate. The suint from the wool of sheep contains a large proportion, sometimes as much as one-third, of an organic potassium salt which is separated as carbonate, together with the wool fat.

The original electrolytic method used by Davy for the preparation of metallic potassium has already been referred to. It was soon superseded by methods which had for their purpose the reduction of the carbonate by means of carbon; thus an intimate mixture of potassium carbonate with charcoal, obtained by igniting crude acid potassium tartrate in an iron crucible, yielded a porous mass which was heated to a white heat in an iron bottle connected with a receiver, into which the potassium distilled over and was condensed. The process now generally used is practically the one invented by Castner, and consists

in reducing a potassium salt, such as the hydrate, by a mixture of carbon and a metallic carbide, or a mixture of very finely divided metal and carbon, which is heated in an iron crucible with an exit tube passing through the lid. The potassium distills over into the receiver and at the end of the operation is placed under petroleum so as to prevent oxidation.

Potassium (symbol, K; atomic weight, 39.11) has, when freshly cut, a bright silvery metallic lustre and a specific gravity of 0.875 at 13° C., being lighter than any other metal except lithium. It is brittle at 0° C., and possesses a crystalline fracture; at 15° C. it becomes soft like wax, and it melts at 62.5° C. (144.5° F.), forming a liquid that closely resembles mercury in appearance. With the exception of cesium and rubidium, it is the most electro-positive element known, and it acts as a powerful reducing agent. On exposure to the air it rapidly becomes converted into the hydrate, and finally into the carbonate. It decomposes water with sufficient energy to ignite the liberated hydrogen. When brought into contact with the halogens and with sulphur, selenium, tellurium, and phosphorus, it unites with them. It also alloys with most metals, usually by being heated with them, and with sodium it forms an alloy of a low melting-point. For commercial purposes its use, especially as a reducing agent, has been almost entirely superseded by sodium, owing to the cheapness of the latter. With oxygen potassium combines to form two oxides, a *monoxide* (K_2O) and a *peroxide* (K_2O_2). The former is formed when potassium hydrate is heated with metallic potassium; it is a gray, brittle mass that has strong basic properties. When dissolved in water this oxide forms potassium hydroxide (KOH), or caustic potash, which, however, is generally prepared commercially by decomposing a dilute solution of potassium carbonate with slaked lime. Potassium hydroxide is a hard, white, brittle, powerfully caustic substance, quickly destroying many animal and vegetable substances, and finds extensive use in the manufacture of soap. It is the *liquor potassæ* of the pharmacopœia, and is used as a caustic in surgical operations, and finds some application in analytical chemistry. Potassium peroxide is formed when metallic potassium is burned in the air. *Potassium arsenate*, called also 'Macquer's salt,' is prepared by fusing together equal parts of potassium nitrate and arsenious anhydride, then dissolving the resulting mass in water and evaporating. On cooling, the arsenate crystallizes out. It is used in calico printing for the purpose of fixing the mordant on the fibre of the material. *Potassium bromide* may be made by dissolving bromine in a solution of potassium hydroxide, evaporating the solution, and igniting the mixture, with the addition of a little charcoal, which reduces potassium bromate to bromide, and the mass is dissolved in water, filtered, and allowed to evaporate and crystallize. A more satisfactory method, however, consists in decomposing iron bromide with potassium carbonate, and allowing the resulting liquid to crystallize. Potassium bromide crystallizes in the form of white cubes that have a strong saline taste, and find extensive application in photography and medicine. *Potassium carbonate*, which was known to the ancients and is described by Aristotle as being prepared by the burning of rushes, was long obtained by burning plants in

dry pits and dissolving the ashes in water, then evaporating till the sulphates, chlorides, etc., separated out by crystallization, and then boiling the mother liquor to dryness in iron pots, which was probably the origin of the name 'potashes.' The process subsequently introduced was similar to that used by Le Blanc for the manufacture of soda ash, and consisted in fusing potassium sulphate with calcium carbonate and coal. Another source is from the suint of sheep's wool. The raw wool on washing yields a mixture which is evaporated to dryness, and the solid residue is calcined in retorts. The resulting mass is dissolved in water and allowed to cool, when the potassium carbonate is deposited as a mass of crystals. This salt, which is a white solid with an alkaline and caustic taste, is used largely in the manufacture of soft soap, glass, potassium chromate, and potassium ferrocyanide. *Potassium chloride*, known commercially as *muriate of potash*, is now largely obtained from the Stassfurt deposits, where it occurs native as sylvite, and in combination with magnesium chloride as carnallite. The last-named is the principal source. The mineral is dissolved in warm water, heated by steam to about 120° C. (248° F.), and then allowed to cool. Between 60° and 70° C. (140° to 158° F.) the magnesium sulphate, calcium sulphate, and sodium chloride separate, and on further cooling about 70 per cent. of the potassium chloride is obtained, the crystals of which are washed with a little cold water to remove any sodium or magnesium chloride, and a product is obtained containing about 95 per cent. of potassium chloride. Small quantities are also manufactured from the ashes of seaweed, which, previous to the working of the Stassfurt deposits, formed one of the principal sources of potassium salts. Potassium chloride is a white crystalline compound with a strong saline taste. It is used chiefly in the preparation of other potassium salts, such as the carbonate and the chlorate, and in an impure state it is employed as a fertilizer. *Potassium bichromate* is prepared by heating together finely ground chromic iron ore with potassium carbonate and lime. The resulting mass is extracted with hot water and the calcium chromate precipitated out by means of potassium sulphate, leaving in solution potassium chromate, which is then converted into the bichromate by treatment with sulphuric acid. The resulting solution is evaporated to crystallization, yielding splendid garnet-red crystals. Potassium bichromate finds extensive use in the preparation of chromium compounds, in the manufacture of various colors, as an oxidizing agent, and in certain photo-engraving processes, owing to the fact that when mixed with gelatin it becomes insoluble when exposed to the light. This particular property has also led to its employment in the manufacture of insoluble glue. *Potassium cyanide* may be prepared by melting potassium ferrocyanide with potassium carbonate in an iron crucible. It is a white crystalline compound, exceedingly poisonous. It finds some use in photography, and as a reducing agent in chemical operations, especially in metallurgy. (See HYDROCYANIC ACID.) *Potassium iodide* may be prepared by dissolving iodine in potassium hydroxide, in the same way as the bromide is made by the action of the hydroxide on bromine. It is also manufactured by decomposing ferrous iodide with potassium carbonate, evaporating, dissolv-

ing the resulting mass, and crystallizing. This salt crystallizes in white cubes that have a sharp taste, and is used chiefly in photography and in medicine. *Potassium nitrate*, which is found native as nitre, or saltpetre, is described under SALTPETRE. *Potassium silicate* is prepared by heating potassium carbonate with white sand in a reverberatory furnace, usually with a small amount of charcoal, by means of which a compound is obtained that is put on the market as a thick solution, and is used as a substitute for sodium silicate in the manufacture of soaps and in fresco painting. (See WATER-GLASS.) *Potassium sulphate* is found in large quantities at Stassfurt, principally as kainite, which is a potassium and magnesium sulphate with magnesium chloride. This mineral, when allowed to remain for some time exposed to the air, deliquesces, and as soon as the soluble magnesium chloride has run off the remaining salt is decomposed by boiling water, so that on cooling the sulphate crystallizes out. It is also obtained by the action of sulphuric acid on a potassium chloride. It is a crystalline salt with a bitter saline taste, and finds use in medicine as a purgative, while large quantities are used for the manufacture of potash-alum and potassium carbonate. It was formerly called *sal polychrest*. The acid sulphate, or bisulphate, the *sal enium* of the older chemists, may be formed by heating potassium sulphate with sulphuric acid, or by heating potassium nitrate with sulphuric acid. It is a white crystalline compound, occasionally used as a flux. Other potassium salts may be found described under the names of the acids contained in them. Consult: Pfeiffer, "Die Stassfurter Kali-Industrie," in vol. ii. of Bolley's *Handbuch der chemischen Technologie* (Brunswick, 1887); Lunge, *A Theoretical and Practical Treatise on the Manufacture of Sulphuric Acid and Alkali* (London, 1891); id., *The Alkali-Maker's Handbook* (ib., 1891). Consult also the dictionaries and industrial works recommended in the article CHEMISTRY.

POTASSIUM CYANIDE. See HYDROCYANIC ACID.

POTATO (from Sp. *patata*, white potato, *batata*, sweet potato, from Haytian *batata*, sweet potato). An important cultivated plant, raised in temperate climates for its esculent tubers. It is often called Irish potato because of its general cultivation and use in Ireland. It belongs to the order Solanaceæ, or nightshade family, which also includes tobacco, belladonna, tomato, egg-plant, and pepper. The potato (*Solanum tuberosum*) is a native of the mountainous districts of tropical and subtropical America, from Chile to Mexico, a form of it even occurring as far north as southern Colorado. It is difficult, however, to determine where it is really indigenous and where it has been introduced by man. Like maize, it was cultivated and its tubers used for food before the discovery of America. It seems to have been first brought to Europe from Peru by the Spaniards early in the sixteenth century, and to have spread from Spain into Holland, Burgundy, and Italy, but only to be cultivated in a few gardens as a curiosity. In nearly all European countries it was called *batata*, by which name sweet potato is designated by English writers down to the middle of the seventeenth century. The data concerning its intro-

duction into Europe are not very definite. It appears to have been brought to Ireland from Virginia by Hawkins, a slave trader, in 1565, and to England by Sir Francis Drake in 1585. Sir Walter Raleigh is said to have taken some tubers to England in 1586 and brought them to the attention of Queen Elizabeth. It was not until a long time after its introduction that the culture of the potato became general. Gerard in his *Herball*, published in 1597, described it under the name of *Batata Virginiana*, but so little were its merits appreciated that it was not even mentioned in *The Complete Gardener*, a work published in 1719. At first it was regarded chiefly as a food for swine and cattle, but later on it was thought that on account of its great yield it might be useful as food for poor people and for the prevention of famine due to failures of the grain crops. The Royal Society of London in 1663 adopted measures for the extension of its culture in accordance with this idea. Its cultivation first became most general in Ireland, but it was not until about the middle of the eighteenth century that it acquired any real importance on the Continent of Europe, and not until the end of that century did it become important as a field crop in Germany and France, which are to-day two of the greatest potato-producing countries of the world. In France the extension of potato culture was mainly due to the efforts of Parmentier, a prominent agriculturist and economist. Historical data concerning the development of the potato as a crop in North America are even more meagre. In 1771 only a white and a red variety were mentioned in the most important English work on gardening, while to-day at some of the experiment stations in Europe and America tests are made of 150 to 200 varieties at one time. Apart from the abnormal development of the tubers and the very much reduced production of seed, it is believed that there have not been great changes in the potato plant since its cultivation became general.

The potato is a perennial plant with smooth herbaceous stems from one to three feet high, pinnate leaves, and white or purple flowers about one inch wide, and producing a globular, purplish fruit or seed-ball of the size of a gooseberry. See PLATE OF VEGETABLES. The tubers are distinct from the roots, being underground stems of considerable size even when the plant is in its native state, and which under the influence of cultivation have become enlarged through the accumulation of starch for the use of the plants grown from the eyes, or buds. Owing to its wide distribution, from the cooler tropics to the cooler temperate zones, it is grown on a great variety of soils, but the soil best suited to the crop is a rich, sandy loam, well supplied with organic matter and well drained. It responds to liberal manuring, but since a direct application often injures the quality of the tubers, barnyard manure is preferably applied the previous year; otherwise complete commercial fertilizers, containing nitrogen, phosphoric acid, and potash, are applied.

The land should be plowed as deeply as possible without turning up the subsoil. The tubers are generally planted in drills wide enough apart to admit of cultivation with the horse hoe, or cultivator, and from 12 to 16 inches apart in the row. The pieces of the tuber used for planting, called sets, cuttings, or seed pieces, are covered about 4 inches deep. Planting is generally done

by hand, but where the crop is grown on a large scale potato planters are used. The crop is planted in the spring when danger of injury by frost has passed. After planting, the soil is harrowed frequently until the plants are all up, when the cultivator is used until the vines shade the ground. The results of experiments at different experiment stations in the United States indicate that the use of half the tuber as a seed piece is preferable to using smaller cuttings or the whole tuber. In the Southern United States two crops of potatoes are sometimes produced on the same land in one year.

POTATO DISEASES. Until comparatively recently the potato blight or rot was believed to be all caused by a single fungus. Two distinct forms are now held accountable, the leaf or early blight, and the late blight or rot. The early blight (*Alternaria solani*) appears upon the leaves as grayish brown spots, which, about the time the tubers are beginning to form, enlarge, and in ten days or two weeks involve half the leaf. In about a month all the foliage may have succumbed. The late blight or rot (*Phytophthora infestans*) appears in August or September, attacking leaves, stems, and tubers. The leaves are first to appear to be injured. They show brown or black areas, which soon become soft and foul-smelling. Moisture and a fairly warm, but not hot, temperature is most favorable to its rapid development, and a few dry, hot days will check its spread. The tubers also become blotched or discolored on the surface and streaked within with brown or black. Since they are likely to rot, the crop is practically worthless. Both of these diseases can be prevented by spraying with Bordeaux mixture, beginning when the plants are 4 to 6 inches high and continuing through the season at intervals of 10 days to 2 weeks. Brown rot, believed to be caused by *Bacillus solanacearum*, is sometimes troublesome in the Southern States. The foliage usually wilts, shrivels, and turns brown or black. Since leaf-eating insects are held accountable for the spread of this trouble, they are combated with insecticides. Rotation of crops is recommended as a means of prevention and care in the selection of seed tubers that they do not come from infested regions. Scab appears as rough, dark patches of varying depth upon the tubers and upon beet roots, rendering them unsightly and destroying the outer portions. Scabby potatoes and infested soil should be avoided. Many growers soak the 'seed' in a solution of 2½ ounces of corrosive sublimate in 15 gallons of water; or 8 fluid ounces of formalin, or formaldehyde, in 15 gallons of water, after which the tubers are spread to dry. These are considered preventive measures.

FOOD AND FEEDING VALUE. When a section of the potato is carefully examined, it will be seen to consist of three more or less well-defined portions, namely, the skin, cortical or fibro-vascular layer, and the flesh, which is made up of the outer and inner medullary layers. The cortical layer, immediately beneath the true skin, and sometimes designated the inner skin, is slightly colored, containing practically all the coloring matter normally present in the potato. As shown by recent analyses, the skin of the potato constitutes on an average 2.5 per cent. of the whole and the cortical layer 8.5 per cent. It is difficult to peel potatoes so that the skin only is removed.

The amount of refuse and edible portion lost by peeling is estimated at 20 per cent. Doubtless, in many cases the rejected portion is very much larger.

The edible portion is made up of 78.3 per cent. water, 2.2 per cent. protein (total nitrogenous matter), 0.1 per cent. fat, 18.4 per cent. carbohydrates (principally starch), and 1 per cent. ash or mineral matter. Of the carbohydrates, 0.4 per cent. is made up of crude fibre and materials which in some of their modifications constitute the cell walls of plants and give them a rigid structure. The fuel value is 385 calories per pound. The above figures, like others for composition of food materials, represent general averages, from which there are wide variations in individual specimens. Though the skin, cortical layer, and flesh differ somewhat in composition, they all resemble more or less closely that of the whole tuber. When potatoes are stored they shrink about 12 per cent. in 7 months.

Although the potato contains some protein, it is chiefly valuable as a carbohydrate food, and, like all such food, is useful for supplying the body with energy. The principal ways of cooking potatoes are baking, boiling, and frying, or some modifications of these processes. Just why cooking changes the flavor as it does has apparently never been made the subject of investigation. In potatoes, as in other foods, the cooked starch is more agreeable to the taste than the raw. Possibly also there are volatile bodies of more or less pronounced flavor which are removed or produced by the heat of cooking. The physical condition of the potato is much affected by heat. In the raw potato the separate starch grains are inclosed in cells with walls composed of crude fibre, a material resistant to digestive juices. If potatoes were eaten raw, the digestive juices would not reach the starch as easily, unless the cell walls happened to be ruptured mechanically, as in mastication. Heat, however, expands the water present, ruptures the cells, and breaks up the starch, expanding the granules, which when raw consist of tightly packed concentric layers. Over 90 per cent. of the total nutritive material of potatoes is digestible. According to statistics obtained in the large number of dietary studies made in this country, potatoes constitute about 13.7 per cent. of the total food consumed by the average American family, and furnish not far from 3.9 per cent. of the total protein and 10 per cent. of the total carbohydrates. The potato is a staple article of diet in almost every household. The universality and extent of its consumption would seem sufficient to prove it to be a wholesome and nutritious food. Scientific investigation shows that the practice, which has become so general, of serving potatoes with meat and other similar foods which contain liberal amounts of protein is based upon correct principles, one food supplying the deficiencies of the other.

Evaporated potatoes are on the market, being especially recommended for provisioning camps and expeditions. As compared with fresh, the evaporated potatoes have a high nutritive value in proportion to their bulk. Large quantities of potatoes are used for the manufacture of starch. Potatoes either raw or cooked are sometimes fed to pigs, milch cows, and other farm animals. When fed to pigs it has been found that 4½

bushels of cooked potatoes (fed with corn meal) is equivalent to one bushel of corn.

POTATO INSECTS. The principal enemy of the common field potato (*Solanum tuberosum*) of the United States is the famous 'potato bug,' or more exactly, the Colorado potato beetle (*Dorophora decemlineata*). This insect, originally confined to the Rocky Mountain region, where it fed upon the sand-bur (*Solanum rostratum*), readily attacked cultivated potatoes as soon as civilization advanced to its native region. In 1859 it had

COLORADO POTATO BUG AND ITS FEEDING LARVA.

spread eastward and reached a point 100 miles west of Omaha; in 1861 it invaded Iowa; in 1864 and 1865 it crossed the Mississippi, reaching Illinois both from northern Missouri and Iowa; in 1867 it had crossed Illinois into western Indiana, and in 1869 had spread across the State and had made its way into Ohio, appearing almost simultaneously in the northern and south-western portions; in July, 1870, it invaded the Province of Ontario; in 1872 it reached western New York, and spread into Pennsylvania, and in 1873 had reached eastern New York and the District of Columbia; in 1874 the Atlantic Seaboard was gained at several points in Connecticut, New Jersey, New York, Pennsylvania, Delaware, Maryland, and Virginia. Its southern spread was much more slow than in the North, and in 1871 it had not touched the extreme southern counties of Missouri. In fact, it was not until 1897 that it succeeded in establishing itself in portions of Mississippi and Georgia. Although accidentally introduced into Europe on several occasions, the species has not established itself outside of North America. The female beetles, which have overwintered beneath the surface of the ground or under any shelter, lay their eggs upon young potato plants as soon as they appear above ground, and will even work into the ground to feed upon the young leaves before these have fairly shown themselves. The dark-reddish larvæ hatch in less than a week, and reach full growth in from two to three weeks, after which they enter the earth to pupate, becoming beetles about a month after the time of hatching. There are three or four generations each year. This insect is readily controlled by the application of Paris green or some other arsenical poison, either as a spray or dusted dry upon the plants. The potato bug is also destroyed by the potato-bug enemy (*Lebia grandis*). See Colored Plate of INSECTS.

The potato crop is sometimes damaged by the so-called stalk-borer (*Gortyna nitela*), an owl moth which lays its eggs on the stalks not only of potato, but also of tomato and of certain ornamental plants. The larva bores into the stalk and causes the plant to wilt. The potato-stalk weevil (*Trichobaris trinotatus*) is very common in the Mississippi Valley. The bluish or ash-gray beetle deposits a single egg in a slit which she has made with her beak in the stalk of the potato. The larva bores into the heart of the stalk and proceeds downward toward the root, pupating within the stalk, issuing as an adult about the last of August. In both cases all wilting vines should be pulled and burned.

The tomato worm (*Sphinx 5-maculata*) also feeds occasionally upon potato, but is not an important enemy of this crop. Potatoes suffer, however, sometimes severely, from the attacks of blister beetles, and a leaf-beetle called the three-lined potato beetle (*Lema trilineata*) occasionally damages the leaves. The cucumber flea-beetle (*Haltica cucumeris*) also preys upon the leaves, as does one of the tortoise beetles.

Consult: Riley, *Potato Pests* (New York, 1876); Smith, *Manual of Economic Entomology* (Philadelphia, 1896).

POTATO ROT, SCAB, etc. See POTATO, paragraph *Potato Discases*.

POTATO STONE. See GEODES.

POT'AWAT'AMI (properly *Potawatmik*, fire-makers, in allusion to their traditional making of a separate council fire for themselves). A prominent Algonquian tribe formerly holding the lower end of Lake Michigan, extending southward to the Wabash River and westward into central Illinois. They were closely related to the Ojibwa and Ottawa (qq.v.). When first known the Potawatami were settled about the mouth of Green Bay, Wis., and were early brought under the influence of the Jesuit mission established at that point. They were then moving southward, and 30 years later had fixed themselves at Chicago and on the Saint Joseph River, on former Miami territory. After the conquest of the Illinois (q.v.) about 1765 they took possession of a great part of Illinois as well as of Lower Michigan. At the Greenville treaty of 1795 they notified the Miami that they intended to move down the Wabash, which they soon afterwards did, in spite of the protests of the Miami, who claimed the whole region. By the year 1800 they were in possession of the whole territory around Lake Michigan from Milwaukee River, Wis., to Grand River, Mich., with much of northern Indiana and Illinois.

They took part with the French in all the colonial wars and were also active in the rising under Pontiac. They sided with England in the Revolution and, with the other tribes, continued the struggle until the Treaty of Greenville in 1795. In the War of 1812 they again took up arms, under Tecumseh, on the English side, and later joined in the final treaty of peace in 1815. Under the systematic plan of removal soon after inaugurated by the Government they sold their lands by successive treaties, so that by 1841 practically the whole tribe had been transported beyond the Mississippi. A large part of those residing in Indiana refused to leave their homes until driven out by military force. Some escaped to Canada and are now settled on Walpole Island, in Lake Saint Clair. Those who went west were settled, partly in Iowa and partly in Kansas, but in 1846 both bodies were united on a reservation in southern Kansas. In 1868 a part of these, known as Citizen Potawatami, were again removed to Indian Territory. A considerable part of the tribe is still in Wisconsin and another small band known as Potawatami of Huron is in Lower Michigan, in addition to the small band on Walpole Island, Ontario. According to Morgan the Potawatami had 15 clans. The most reliable early estimates give them from 2500 to 3000 souls at their greatest strength. They now number about 2500 in all, viz. Citizen Potawatami, Oklahoma, 1690; Prairie band, Kansas, 570;

Potawatami of Huron, Michigan, 80; scattering in Oklahoma, Wisconsin, Indiana, etc., perhaps 200; Walpole Island and Aux Sables, Ontario, mixed Potawatami and Ojibwa, 200.

POT-BOUILLE, pó'bóu'éy'. One of Zola's Rougon-Macquart series of novels (1883), a satire on the corrupt commercial bourgeoisie of Paris.

POTCHEFSTROOM, pöch'éf-ström. A town in the southern part of the Transvaal Colony, South Africa, 105 miles southwest of Pretoria. (Map: Transvaal Colony, D 5). Population, about 5000.

POTEKHIN, pót-yèk'in, ALEXEI ANTIPOVITCH (1829—). A Russian dramatist and novelist. He was born at Kineshma, in Kostroma, studied at Jaroslav, and settled in Saint Petersburg. As a novelist he is a realist of much the same school as Pisemsky and especially able in his portrayal of dismal village life. His earlier works on the drama were slow in getting to the stage, as they were blocked by the censors for their attacks on present conditions. They include: *The Voice of the People Not the Voice of God* (1853); *Ill-Gotten Gains Do Not Prosper* (1854); *Tinsel* (1858); *The Severed Limb* (1865); and *A Vacant Place* (1870). His novels and tales of peasant life include: *The Poor Nobles* (1859); *For Money*, a story of factories; *The Sick Woman* (1876); *Under the Spell of Money* (1876); *Before the Community* (1877); *Young Inclinations* (1879); and *Village Vampires* (1880).

POTEMKIN, *Russ. pron.* pot-yám'kín, GREGOR ALEXANDROVITCH, Prince of Taurida (1736-91). A Russian politician, born in the Government of Smolensk. He was educated at Warsaw and became an ensign in the Imperial Horse Guards. He won the favor of the Empress Catharine II. (q.v.), and in 1762 he was made an officer of her household, succeeding in time Orloff as the recognized favorite of the Empress. When, in his turn, he was superseded as a lover, he retained his ascendancy in affairs of State, being made general-in-chief of the army, field-marshal, and governor of important provinces. As the principal representative of the Russian foreign policy, his influence was courted by the foreign rulers, and, in spite of a lack of the real gifts of statesmanship, he displayed a certain amount of skill in the conduct of affairs. He zealously furthered the process of southern expansion at the expense of the Turks, was instrumental in annexing the Crimea to Russia (1783), and for this service received the title of Prince of Taurida together with the governorship of the newly acquired territory. He devoted himself to the economic development of the southern provinces of Russia, founded the towns of Kherson, Kerteh, Nikolaev, and Sebastopol, and strengthened Russia's power in the Black Sea. It is told, as an illustration of the methods by which he preserved the Imperial favor, that in 1787, when Catharine visited his government, he caused a large number of villages to be constructed along her route, with hirelings to play the part of contented peasants and well-fed citizens, all of which pleased her Majesty and brought Potemkin increased honors. He died near Nikolaev, in Bessarabia, during the course of Catharine's second war against the Turks, October 16, 1791.

Consult: De Crenville, *Vie du Prince Potem-*

kin (Paris, 1808); Saint Jean (Potemkin's secretary), *Lebensbeschreibung des Gregor Alexandrovitch Potemkin des Tauriers*, edited by Rothermel (Karlsruhe, 1888); and lives in Russian by Levshin (2 vols., Saint Petersburg, 1808) and Brückner (1892).

POTENT. The name of a fur used in heraldry (q.v.).

POTENTIAL (OF. *potential*, *potentiel*, Fr. *potentiel*, from Lat. *potentia*, power, from *posse*, to be able). A mathematical term used to express that property of a field of force (see FORCE) which determines in which direction motion will take place if there are no restraints. In an electrical field of force the potential at a point is defined as the work required to carry a particle with a unit positive charge up to that point from an infinite distance away. If left to itself a positive charge will, therefore, always move from points of high to those of low potentials. In a magnetic field of force, the potential at a point is defined as the work required to bring up from an infinite distance to that point a unit north pole. If free to move, a north pole of a magnet will move from points of high to those of low potential.

In a gravitational field of force, the potential at a point is defined as the work required to bring up to that point from an infinite distance a unit mass of matter. Portions of matter, if free to move, do so from points of high to those of low potential.

In the application of thermodynamics to chemical phenomena a potential is such a function of the variable qualities that for all allowable changes it has the lowest possible value—it is a minimum.

POTENTIAL ENERGY. See MECHANICS.

POTENTILLA (Neo-Lat., from Lat. *potens*, powerful; so called on account of properties ascribed to it in mediæval medicine), CINQUEFOIL.

A genus of numerous species of mostly perennial herbs of the natural order Rosaceæ, widely distributed in the Northern Hemisphere. The genus differs from *Fragaria* (strawberry), which it otherwise resembles, in having dry instead of succulent receptacles of the fruit. The flowers are yellow, white, red, or purple, the leaves pinnate, digitate, or ternate. One species (*Potentilla fruticosa*) often planted in shrubberies is abundant in North America from Pennsylvania to Iowa and northward, and forms a profusion of yellow flowers. *Potentilla Anserina*, silverweed, a European species also common in America, has creeping stems, yellow flowers, beautifully silky and silvery leaves, and edible parsnip-flavored roots, which are much relished by swine and were formerly used as human food. There are a score or

SHRUBBY CINQUEFOIL.
(*Potentilla fruticosa*).

more species in the northern and central portions of the United States.

POTENZA, pò-tèn'sà. The capital of the Province of Potenza, Italy, situated on a hill near the Basento, 55 miles east of Salerno (Map: Italy, K 7). It is surrounded by a wall; it has a Doric cathedral, a gymnasium, a lyceum, a seminary, and an industrial school. The industries are the cultivation of the vine and the manufacture of bricks. Potenza has been largely rebuilt since the earthquake in 1857. Remains of several ancient cities, including *Potentia*, are in the vicinity. Population (commune), in 1881, 20,281; in 1901, 16,186.

POTGIETER, pòt'gè-tër, EVERHARDUS JOHANNES (1808-75). A Dutch critic and poet, born at Zwolle. He was engaged in business in Antwerp for a time, then settled in Amsterdam, where he became one of the circle of younger authors, and in 1837 founded *De Gids*, in which he made himself a name by clever criticism and excellent fiction and verse. These papers were collected partly by himself (1864-69; and in many editions) and partly by Zimmermann (1875 et seq.). Potgieter's further works are: *Het Noorden in omtrekken en tafereelen* (1836-40); *Liedekens van Bontekoe* (1840); a poem *Florence* (1868), typical of his worse style because of its obscurity; and a biography of Bakhuizen van den Brink (1870; 2d ed. 1890). Consult: Groenewegen, *E. J. Potgieter* (Haarlem, 1893); and Beets, *Persoonlijke herinneringen* (ib., 1892).

POTHIER, pò'tyá', ROBERT JOSEPH (1699-1772). A celebrated French law writer. He was born at Orleans; received a thorough education in a denominational school; studied law at the University of Orleans, attaining distinction in his classes; and after his admission to practice was made a judge of an inferior local court. He retained his studious habits, and in 1749 he was made a professor of law in the University of Orleans. He devoted himself to legal literature with great success. Perhaps his most important work was *Pandectæ Justinianæ in Novum Ordinem Digestæ* (Pandects of Justinian) (Paris, 1818-20). His works entitled *Maritime Contracts* (Boston, 1821), *Treatise on Obligations* (3d Amer. ed., Philadelphia, 1853) and *Contract of Sale* (Boston, 1839) were translated into English and published in the United States. Much of the Civil Code of France was compiled from his works.

POTI, pò'tyè. A seaport on the western coast of the Caucasus, Russia, situated in a marshy and unhealthy region at the mouth of the Rion and 60 miles west of Kutais (Map: Russia, F 6). Although it has only a small harbor, Poti is one of the chief seaports of the Caucasus and the terminus of one of the principal railway lines. Its chief exports are corn, manganese, palm wood, and grain. The imports are insignificant. Population, in 1897, 7700.

POTIDÆA (Lat., from Gk. Ποτιδαία, *Potidaia*). An important town of Macedonian Chalcidice. Originally a colony of Corinth, it became tributary to Athens. Its revolt from the latter city in B.C. 432 was one of the causes of the outbreak of the Peloponnesian War. In B.C. 429 the town was forced to surrender to the Athe-

nians. A century later it was rebuilt by Cassander and renamed Cassandria.

POTIER, pò'tyá', ALFRED (1840—). A French physicist and engineer, born at Paris. He studied at the Polytechnique and the Ecole des Mines, was appointed engineer in 1863, engineer-in-chief in 1881, in the latter year became professor of physics in the Polytechnique, and in 1891 was elected a member of the Academy of Sciences. His researches include interesting studies in geology and investigations, with Joubert, Allard, and others, to determine a means of measuring the energy dispensed by magneto and dynamo-electric machines and instruments. His published writings consist of papers contributed to the *Comptes Rendus* of the Academy of Sciences, the *Journal de physique*, the *Annales de physique et de chimie*, and other periodicals.

POTIPHAR PAPERS, THE. A series of satires by George W. Curtis on the vulgar, vain, shallow society of his day, contributed to *Putnam's Magazine* (1853).

POTLATCH (Nootka Indian *potlatsh*, *pahtlatsh*, gift). A custom of ceremonial gift distribution on a large scale, prevalent among the Kwakiutl, Chimshyan, and other tribes of the northwest coast. The custom is the greatest of all public ceremonies among these tribes, and the principal actor spends a lifetime of preparation in accumulating and storing up valuable property, all of which is finally to be given away in one magnificent display of generosity in the presence of the assembled tribesmen from the villages for miles around. Although to a stranger this wholesale giving appears a mere display of wasteful extravagance, it is in fact a wise investment at compound interest to be repaid in double value when need shall demand and in whatever form of help may be required. Boas says: "The principle underlying a potlatch is that each man who has received a present becomes to double the amount he has received the debtor of the giver."

The potlatch is in fact the recognized investment system of the northwest coast, the security being guaranteed by tribal honor. Potlatch ceremonies are celebrated on all important occasions, as the taking of a name or a wife, the initiation into a new dance, the installation of a chief, as well as at the will of the individual giver. When a great distribution is to be made, the announcement is first sent out by the chief to all the neighboring tribes, after which the date is fixed by council in the tribe of the giver. Messengers are then again sent out to invite the guests, who come in canoes, halting at some distance from the village to put on their best dress and paint. They then advance to the village in grand canoe procession, the bows of the canoes all abreast, each tribe singing its own song for the ceremony. As they draw near, the whole village goes down to the beach to welcome them, the chief's son or daughter, dressed in the mask of his clan, leading the way with a dance in their honor. A few blankets are given them, when they are escorted to the chief's house, where blankets are again distributed. They are then feasted, first by the chief, and then by all the others of the tribe who can afford it. After the feasting is done the grand distribution takes place, with songs and ceremonial accompaniment, each guest receiving blankets and other property

according to his rank. There is a farewell feast and the visitors return to their canoes and their homes.

POTOCKI, pò-tòts'ké. The name of a Polish family of high rank, possessing large estates in Galicia and the Ukraine. After the sixteenth century several members of the family held important places in State and Church. Among the most noteworthy may be mentioned: (1) **COUNT STANISLAS FELIX POTOCKI** (1745-1805), chief of the Polish artillery. In 1792 he joined Branicki and Rzewuski in issuing the manifesto of the confederation of Targovitz (q.v.). The next year he attempted, with the aid of Catharine II. of Russia, to carry out the objects of the confederation. The insurrection of 1794 forced him to leave Poland, and he fled to Russia. In his absence he was sentenced to death for treason, but the success of Suvaroff enabled him to return to Poland. He was appointed Russian field-marshal by Catharine in 1795.

(2) **COUNT IGNAZY POTOCKI** (1751-1809), grand marshal of Lithuania, a cousin of Stanislas Felix. He helped to form the Constitution of 1791; fled to Prussia upon the invasion of Poland by the Russians, but returned after the success of Kosciuszko, and became a member of the new Government. He was made prisoner by Suvaroff, and confined in Schlüsselburg. Released in 1796, he lived in Galicia till the approach of Napoleon's army in 1806, when he was again imprisoned for a short time.

(3) **COUNT STANISLAS KOSTKA POTOCKI** (1752-1821), brother of Ignazy, was prominent in drawing up the Constitution of 1791, and after the second partition of Poland was for a short time under arrest. After his release he became a devoted patron of science and literature. In 1807 he became head of the educational system in the Duchy of Warsaw; and after the Kingdom of Poland was reorganized (1815), became Minister of Public Instruction. He wrote a treatise on the *Art of the Ancients* and *On Eloquence and Style* (1815).

(4) **COUNT JAN POTOCKI** (1761-1816) was eminent as a student of Slavic antiquities and wrote several historical works, among them *Fragments historiques et géographiques sur la Scythie, la Sarmatie et les Slaves* (4 vols., Brunswick, 1795); *Histoire primitive des peuples de Russie* (Saint Petersburg, 1802). He also wrote memoirs upon Egyptian antiquities and *Voyage dans l'Empire de Maroc* (Warsaw, 1792). These works were printed in editions of but one hundred copies, and are therefore very rare. They have some value as collections of material.

(5) **COUNT ALFRED POTOCKI** (1817-89) rose to prominence as a member of the Galician Diet and the Austrian House of Peers. From 1867 to 1870 he was Austrian Minister of Agriculture, and from April, 1870, to February, 1871, head of the Cabinet.

POTOCKI, WACLAW (c.1622-97). The most prolific Polish poet. He served in the army, fighting in the war against the Cossacks (1653); in 1683 was appointed commissioner to map the boundary of Silesia; and lived his last years on his hereditary estate of Luzna. Potocki is known in our time for an epic, *Wojna Chocimska*, on the victory over the Turks at Chocim in 1621, a poem

which received no recognition from his contemporaries and was lost until 1850. It is an epic of much merit, with many satiric contrasts between the heroic simplicity of old times and the luxury of the new. Potocki's contemporary fame rested on *Poczet herbów* (1696), a heraldry in verse; some devotional poems (1690); *Jocialitates* (1747), consisting of witty epigrams; *Syloret* (1764), a tale; and a version of Barclay's *Argenis* (1697).

POTOMAC. One of the most important rivers of the Eastern United States, forming throughout its course the boundary between Maryland on the north and east, and West Virginia and Virginia on the south and west (Map: Maryland, K 8). It rises in two branches, the North Branch in the western Alleghanies on the boundary of Maryland, and the South Branch in the central Alleghanies in western Virginia, the junction of the headstream being 14 miles southeast of Cumberland, Md. Thence the main stream flows in a much winding southeast course till it empties into Chesapeake Bay, 75 miles from the Atlantic Ocean. Its total length is about 400 miles, and its chief tributaries, besides the South Branch, are the Shenandoah from the south and the Monocacy from the north. The scenery along its upper course is remarkably picturesque, especially where it breaks through the Blue Ridge at Harper's Ferry. There are several falls in its passage through the mountains and through the Piedmont Plain below, the Great Falls being about 10 miles above Washington. At that city, 125 miles from its mouth, the river becomes a tidal stream, navigable for large ships, and for the last 100 miles it is a magnificent estuary from two to seven miles wide. The Chesapeake and Ohio Canal follows its course from Georgetown to Cumberland. The whole region through which the river flows is full of historic landmarks. Opposite Washington is Arlington (q.v.), and a short distance below are Alexandria and Mount Vernon.

POTOMAC FORMATION. A name applied to a series of deposits which are chiefly of Lower Cretaceous age, but may be also partly Jurassic. The formation is found along the Atlantic border of the United States from Martha's Vineyard to Georgia, and also up the Mississippi Valley to Tennessee. It consists of a series of sands, gravels, and clays. The latter are worked at many points, notably in New Jersey, and certain members of the series supply iron ore and glass sand. Consult: White, "Correlation Papers, Cretaceous," *Bulletin United States Geological Survey* No. 82 (Washington, 1893). See CRETACEOUS SYSTEM.

POTOMETER (from Gk. ποτόν, *poton*, drink + μέτρον, *metron*, measure). An instrument for observing the rate at which plants evaporate water. The simple form used in physiological laboratories consists essentially of a graduated capillary glass tube (*c* in the figure), to which is connected a transpiring shoot. The tube is filled with water and the lower end dipped into water. As evaporation from the leaf surface proceeds water is drawn up the tube, whose narrow bore accelerates the rate of flow. This may be made evident by lifting the end of the tube for an instant and allowing air to enter. On replacing the tube water again enters, and as the short bubble travels along the tube its rate may be observed and

recorded. By exposing the leaves to varying conditions of light, heat, wind, and moisture in the air the effect of external conditions upon evapora-

tion may be easily shown. Somewhat complex self-registering instruments have been made. See **TRANSPIRATION.**

POTOO, or **GRAND POTOO**. A name given by the Creoles in the West Indies to one of the large nightjars (*Nyctibius Jamaicensis*), especially common in Jamaica. It represents a small group confined to South America and the Antilles, remarkable for the tooth of the upper mandible.

POTOSÍ, pò'tò-sé'. A southwestern department of Bolivia, bounded by Chile on the west, Chile and Argentina on the south, the Bolivian departments of Tarija and Chuquisaca on the east, and Oruro and Cochabamba on the north (Map: Bolivia, D 8). Its area is estimated at 52,100 square miles. The surface is very mountainous, and at the northwestern end is situated an extensive saline marsh known as the *Grandes Salinas*. The region is drained chiefly by the head-streams of the Pileomayo. Agriculture is only of secondary importance; the chief industry is the exploitation of the silver mines, which are supposed to be the richest in Bolivia. Besides silver there are also found gold, tin, and copper. The population was officially estimated in 1900 at 365,500, the bulk of whom are Indians. Capital, Potosí (q.v.).

POTOSÍ. The capital of the Department of Potosí, in Southwestern Bolivia. It is situated on the Cerro de Potosí at an altitude of 13,325 feet, being probably the highest town in the world (Map: Bolivia, D 7). It lies several hundred feet above what has been considered the highest inhabitable altitude, and, owing to the rarity of the atmosphere, infant mortality is so great that the population can be kept up only by immigration. The city is now only a shadow of its former self. A large part of it lies in ruins, through which passes the now deserted Prado, lined with statues and other evidences of former grandeur. There are several fine and solid buildings, such as the great granite cathedral, and the mint, the latter built in 1562 at a cost of over a million dollars, but no longer used. Potosí owes its origin to the silver lodes which were discovered in the Cerro in 1546, and which for a long time remained the richest silver mines in the world. The total output for the next 300 years

up to 1850 is estimated at \$1,600,000,000, or an average of over \$5,000,000 per year. The city itself grew rapidly, and in the seventeenth and eighteenth centuries was the largest city in the New World, its population being then estimated as high as 170,000. The mines are now almost abandoned, only a few of the 2000 shafts being still worked. The present population is about 16,000. Consult Contzen, *Potosí* (Hamburg, 1893).

POTOTAN, pò-tò'tán. A town of Panay, Philippines, in the Province of Iloilo, situated on the Jalaur River, 16 miles north of Iloilo (Map: Philippine Islands, G 9). It is well laid out, has a large church, and a population of 14,500.

POT-POURRI, pò'pò'r-ré' (Fr., rotten pot). In music, a selection of favorite pieces strung together without much connection, so as to form a sort of medley. Such arrangements generally have very little artistic value.

POTSDAM, pòts'dám. The capital of a district of the same name, a royal residence and the seat of the administration of the Prussian Province of Brandenburg, situated on the Potsdamer Werder, an island in the Havel, 16 miles southwest of Berlin, with which it is connected by three railway lines (Map: Prussia, E 2). The town is celebrated for its beautiful situation amid the numerous lakes of the Havel, as well as for its picturesque environs embellished by luxurious gardens, royal palaces, fountains, statues, etc. The city proper consists of the old town and four suburbs. Of the suburbs the Teltower, on the south, is connected with the old town by a fine stone bridge crossing the intervening *Freundschaftsinsel*. Potsdam is laid out in regular, broad and shaded streets, which form a number of fine squares. The *Wilhelmsplatz* has a statue of Frederick William III., and the *Lustgarten*, opposite the palace, is adorned with a number of statues and busts, including a statue of Frederick William I. The principal churches are the Garrison Church, built in 1731-35, with a high tower, and containing the remains of Frederick the Great and his father in a vault under the chancel; the Church of Saint Nicholas (1830-37), built from designs by Schinkel, with a fine dome; and the *Friedenskirche*, in the style of an early Christian basilica, at the entrance to the Park of Sans Souci.

Of the many secular edifices of note may be mentioned the palace, originally erected in 1670, and rebuilt in 1750, and containing the apartments of Frederick the Great; the town hall (1754), with a gilded figure of Atlas on its gable; the military orphan asylum; the theatre; the barracks, etc. Potsdam has a number of fine gates, of which the Brandenburg Gate, in the west, built in 1770 in the style of a Roman triumphal arch, leads from the city to the Park of Sans Souci (q.v.). The park contains, besides the famous residence of Frederick the Great, the palace of Charlottenhof, with reliefs by Thorwaldsen, and the new palace, at the western end of the park, founded by Frederick the Great and used as a summer residence by Emperor William II.

Potsdam has only few industries. Its chief manufactures are sugar, beer, and optical instruments. The Geodetic Institute is located here. Of the noted places in the vicinity may be mentioned the Russian settlement of Alexandrovka,

north of the city, founded by Frederick William III., in 1826; the Neu-Garten, stretching along the Heilige See, with the Marble Palace on the lake; the Pfingstberg in the north, with a fine Belvedere; the Klein-Glienicke on the left bank of the Havel, with the palace of Prince Frederick Leopold, surrounded by a splendid park; the palace of Babelsberg, with its fine art collections and beautiful fountains; the Brauhausberg, commanding a fine view of the surrounding country; and the Telegraphenberg, with an astro-physical observatory. The population of the city was 59,814 in 1900, chiefly Protestants.

The importance of Potsdam dates from the second half of the seventeenth century, when the Great Elector Frederick William built there a palace and laid out the Lustgarten. It was, however, during the reign of Frederick the Great that Potsdam attained its full development and fame. Consult: *Geschichte der königlichen Residenzstadt Potsdam*, ed. by A. R. (Potsdam, 1883); Sello, *Potsdam und Sans Souci* (Breslau, 1888).

POTS'DAM. A village in Saint Lawrence County, N. Y., 25 miles east of Ogdensburg; on the Raquette River, and on the Rome, Watertown and Ogdensburg branch of the New York Central Railroad (Map: New York, F 1). It is the seat of a State normal school, with a library of 5000 volumes, and of the Thomas S. Clarkson Memorial School of Technology, founded in 1895. Potsdam sandstone (q.v.) is quarried extensively in the vicinity. Other industries are agriculture and lumbering. The principal manufactures include paper, flour, lumber products, farm implements, and machinery, the industrial interests of the village being favored by the excellent water power of the Raquette River. The water works are owned by the municipality. Potsdam was settled in 1803 and incorporated as a town in 1806. The village of Potsdam was incorporated in 1831. Population, in 1890, 3396; in 1900, 3843.

POTSDAM SANDSTONE. The uppermost division of the Cambrian system, so called from the type locality at Potsdam, New York. The rock is a red or yellow sandstone, sometimes altered to quartzite, and of great hardness. It is extensively employed as a building stone. The formation is developed on the borders of the Adirondack Mountains, and in Virginia, Michigan, and Wisconsin. See CAMBRIAN SYSTEM.

POTSTONE (translation of its Latin name, *lapis ollaris*). An impure variety of talc containing chlorite. It is generally greenish-gray to dark green in color, and occurs massive or in granular concretions. Being easily cut when newly mined, it was made into pots and other household utensils by the ancients, the method of making vessels from it being described by Pliny. It was formerly procured in abundance in the island of Siphanto and in Upper Egypt; also on the Lake of Como, Italy, and in Norway, Sweden, and Greenland.

POTT, AUGUST FRIEDRICH (1802-87). A distinguished German philologist, the founder of modern scientific etymology. He was born at Nettelrede, Hanover, November 14, 1802, and was educated in the lyceum at Hanover, studied theology, philology, and natural sciences at Göttingen (1821-25), then was assistant at the gymnasium in Celle until 1827, when he went

to Berlin to become a pupil of Bopp. In 1830 he became privat-docent there, and in 1833 was appointed professor of comparative philology at the University of Halle, which position he occupied until his death, July 5, 1887. The work which established his reputation was the *Etymologische Forschungen auf dem Gebiete der indogermanischen Sprachen* (1833-36), published afterwards in a revised and much enlarged edition under the title *Wurzelwörterbuch der indogermanischen Sprachen* (1859-76). The most important among his other writings include: *De Litvano-Borussiae in Slavicis Letticisque Linguis Principatu* (1837-41); *Die Zigeuner in Europa und Asien* (1844-45); *Die quinäre und vigesimal Zählmethode bei Völkern aller Welttheile* (1847); *Die Personennamen, insbesondere die Familiennamen und ihre Entstehungsarten* (2d ed. 1859); *Die Ungleichheit menschlicher Rassen, hauptsächlich vom sprachwissenschaftlichen Standpunkt* (1856); *Anti-Kaulen, oder mythische Vorstellungen vom Ursprung der Völker und Sprachen* (1863); *Allgemeine Sprachwissenschaft und Carl Abels ägyptische Sprachstudien* (1886). Besides many essays and critical reviews in various periodicals, he contributed important treatises to Ersch and Gruber's *Allgemeine Encyclopädie* and edited Wilhelm von Humboldt's *Ueber die Verschiedenheit des menschlichen Sprachbaues*, with an introductory essay, *Wilhelm von Humboldt und die Sprachwissenschaft* (Berlin, 1876; 2d ed. 1880). Consult: Von der Gabelentz, in *Allgemeine deutsche Biographie*, vol. xxvi. (Leipzig, 1888); and Horn, in *Bezenberger's Beiträge zur Kunde der indogermanischen Sprachen*, vol. xiii. (Göttingen, 1888).

POTT, PERCIVAL (1713-88). An English surgeon. He was born in London, served as assistant surgeon in Saint Bartholomew's Hospital, 1745-49, and as surgeon, 1749-87. He was distinguished for his investigation of angular curvature of the spine, the consequence of disease of the bones of the spinal column, on which account the affection is known as Pott's disease (q.v.). His principal works are: *A Treatise on Ruptures* (1756; 3d ed. 1775); *Fistula Lacrymalis* (1758; 5th ed. 1775); *Observations on Wounds and Contusions of the Head, etc.* (1760); *Practical Remarks on Hydrocele* (1762; 2d ed. 1767); *Remarks on Fistula in Ano* (1765; 4th ed. 1775); *Some Few General Remarks on Fractures and Dislocations* (1769; French ed., Paris, 1788; Ital. ed., Venezia, 1784); *Remarks on That Kind of Palsy of the Lower Limbs Found to Accompany a Curvature of the Spine* (1779).

POTTER, ALONZO (1800-65). A bishop of the Protestant Episcopal Church. He was born at Beekman (now La Grange), Dutchess County, New York, of Quaker parentage, July 6, 1800. In 1818 he graduated at Union College with the highest rank in his class. He served as tutor in his college and in 1821 was appointed professor of mathematics and natural philosophy. At the same time he studied theology, and was ordained in 1824. The same year he married a daughter of President Eliphalet Nott, of Union College. From 1826 to 1831 he was rector of Saint Paul's Church, Boston. In 1832 he returned to Union as professor of philosophy; in 1838 he was made vice-president, and was virtually president until 1845, when he was chosen Bishop of

Pennsylvania. As bishop he showed great administrative ability; many new churches were built in his diocese, and an Episcopal hospital, academy, and theological school were founded and endowed in Philadelphia. He was a friend of the negro and active in work for young men. In consequence of impaired health, he undertook a voyage to California, and died at San Francisco, three days after arriving there, July 14, 1865. During his connection with Union College Bishop Potter wrote several text books and other scientific works of a popular and practical character; he published a volume of *Discourses, Charges, Addresses, and Pastoral Letters* (1858), *Religious Philosophy* (1870), and edited *Lectures on the Evidences of Christianity* (1855). Consult the memoir by Bishop Howe (Philadelphia, 1870).

POTTER, BESSIE. See VONNOIL, ROBERT WILLIAM.

POTTER, CLARKSON NOTT (1825-82). An American politician, son of Bishop Alonzo Potter (q.v.). He was born at Schenectady, N. Y., graduated at Union College in 1842, then spent a year at the Rensselaer Polytechnic Institute, at Troy, and in 1843 removed to Wisconsin, where he became a surveyor. He soon abandoned this work, however, to study law, and in 1848 settled in New York, where he became one of the most prominent members of the bar. In 1869 he was elected to Congress on the Democratic ticket, and both in 1871 and in 1873 was reelected. From 1877 to 1881 he was again a member of Congress. On May 13, 1878, after the Electoral Commission had finished its work, he offered a resolution for the appointment of a select committee "to inquire into the alleged false and fraudulent canvass . . . in . . . Louisiana and Florida." This committee was appointed with him as its chairman, but failed to reach a unanimous decision.

POTTER, ELIPHALET NOTT (1836-1901). An American educator, son of Bishop Alonzo Potter (q.v.). He was born at Schenectady, N. Y., and graduated at Union College in 1861, and at the Berkeley Divinity School a year later. In 1862 he entered the Episcopal ministry and became rector of the Church of the Nativity in South Bethlehem, Pa., an office which he held until 1869. In 1866 he was chosen professor of ethics in Lehigh University, but in 1871 resigned to become president of Union College, and two years later, when the college became a university, he was elected its chancellor. In 1884 he resigned this position to become president of Hobart College, and in 1897 he accepted the presidency of the Cosmopolitan University, by which instruction was given through correspondence. He published *Parochial Sermons; Christian Evidences at the Close of the Nineteenth Century; and Washington a Model in His Library and Life* (1895).

POTTER, HENRY CODMAN (1835-). A bishop of the Protestant Episcopal Church. He was born at Schenectady, New York, May 25, 1835, a son of Bishop Alonzo Potter (q.v.). He was educated at the Episcopal Academy in Philadelphia and the Theological Seminary of Virginia. He was ordained deacon in 1857, priest in 1858, and was successively rector of Christ Church, Greensburg, Pennsylvania (1857), Saint John's Church, Troy, New York (1859), assistant at Trinity Church, Boston (1866), and rector of

Grace Church, New York (1868). In 1883 he was chosen Assistant Bishop of New York and on the death of his uncle, Bishop Horatio Potter (q.v.), in 1887, he became Bishop. He has taken an active part in efforts to promote cordial relations between employers and employed and his ability and public spirit have given him a wide influence which is not bounded by denominational lines. Besides numerous sermons and addresses he has published: *Sisterhoods and Deaconesses at Home and Abroad* (1871); *The Gates of the East: A Winter in Egypt and Syria* (1876); *The East of To-day and To-morrow* (1902); *The Citizen in Relation to the Industrial Situation* (the Dodge lectures before the Yale Law School, 1902).

POTTER, HORATIO (1802-87). A bishop of the Protestant Episcopal Church. He was born at Beekman (now La Grange), Dutchess County, N. Y., February 9, 1802, and was a brother of Alonzo Potter (q.v.). He graduated at Union College in 1826, and was ordained priest in 1828. The same year he was chosen professor of mathematics and natural philosophy in the college which is now known as Trinity at Hartford, Conn. He was rector of Saint Peter's Church, Albany, N. Y. (1833-54). In the latter year he was elected Provisional Bishop of the diocese of New York and in 1861 became Bishop. The diocese prospered greatly under his able administration. He was especially interested in city mission work, and was very successful in promoting the peace and quiet of the Church and abating controversy. Bishop Potter died in New York, January 2, 1887. He published nothing except pastoral letters, addresses, and occasional sermons.

POTTER, PAULUS (1625-54). The principal animal painter and etcher of the old Dutch school. He was born at Enkhuizen, where he was baptized on November 20, 1625. In 1631 his father, Pieter Simonz Potter, a mediocre painter, became a citizen of Amsterdam, and from him Paulus derived his artistic training. He may also have been influenced by his precursor, Aelbert Klomp; but he worked chiefly after nature, as is very evident from his studies, of which four volumes are preserved in the Berlin Museum—the only surviving example of such studies by a Dutch painter of the first rank. In 1646 he became a member of the Painters' Guild of Delft, and in 1649 he settled at The Hague, where he married the daughter of an influential architect. He was already a famous painter, rejoicing in the patronage of Maurice of Nassau, of Princess Amalie, wife of the Stadtholder, and others of the nobility. In 1653, at the solicitation of Burgomaster Tulp, he removed to Amsterdam, where he died January 17, 1654.

Notwithstanding his short life, he produced a large number of pictures—106 according to Westreheene. He rendered the character of animals with great power and truth; his drawing was correct, imparting an almost plastic effect, and his color was delicate. Although he painted with great care and attention to detail, he did not lose the ensemble. His backgrounds—the flat Dutch landscape, sometimes with a few trees—are true in color and perspective. His best known picture is the life-size "Bull" (Hague Museum), of which the chief figure is a wonderful piece of realistic animal characterization; but neither this nor his "Bear Hunt" (Amsterdam, Ryksmuseum)

PAUL POTTER
"THE BULL" FROM THE PAINTING IN THE GALLERY AT THE HAGUE

equals his smaller pieces. The Hermitage at Saint Petersburg possesses 11, including the famous "Cow," refused by the Stadtholder's wife, and the "Judgment of the Animals Over the Hunter;" others are in the museums of The Hague, Amsterdam, Paris, Berlin, Dresden, and especially in English private collections, where the largest number are to be found. Potter was also an etcher of note, simple and direct in his treatment. He left no school, and of his supposed pupils Aelbert Klomp was a precursor, and the two Camphuysens were independent contemporaries. Consult: Van Westreene, *Paulus Potter, sa vie et ses œuvres* (Hague, 1867); Grattel Duplessis, *Eaux-fortes de Paul Potter* (Paris, 1876).

POTTER, ROBERT B. (1829-87). An American soldier, born in Boston. He was a son of Bishop Alonzo Potter and a brother of Bishop Henry C. Potter. He graduated at Union College, and studied law, but in 1861 withdrew from practice in order to enter the Federal Army. He was commissioned lieutenant-colonel of the Fifty-first New York Volunteers, led three companies at Roanoke Island, was wounded at New Berne, fought in the second Bull Run campaign and at South Mountain, and distinguished himself by making a spirited charge at the head of his regiment at Antietam, where he was again wounded. He was made a brigadier-general in 1863, commanded a division in the Knoxville campaign, served with Grant in the Wilderness, and was a third time wounded in the assault made on Petersburg after the explosion of the mine. He was commissioned major-general of volunteers in 1865, and resigned in 1866.

POTTER-BEE. A mason bee of the genus *Osmia* and its allies, which constructs small globular cells of earth and attaches them to the stem of a plant in much the same manner as do the potter-wasps (q.v.) of the family Eumenidæ.

POTTER'S CLAY. A term commonly applied to any fine-grained, plastic clay which can be used in the manufacture of pottery. Clays employed for the making of pottery must have sufficient plasticity, and also burn to the proper body without warping or cracking in the firing process. In order to produce these results it is sometimes necessary to mix two or more kinds of clay together. Potter's clays are found in many localities, and also in many different geological formations; those found in the recent surface deposits are commonly too impure to permit their use for anything except the cheaper grades of ware. The higher grades of pottery are always molded from a mixture of at least three kinds of clay, and in this case the raw material is sometimes freed from gritty particles by a preliminary washing. After mixing it is sometimes stored in damp cellars for a year or more, with the idea that its plasticity will thereby be improved. The value of potter's clay ranges from a few cents per ton for common earthenware clays up to \$10 or \$12 per ton for china clays. In the United States the lower and medium grades of potter's clays are abundant, but the demand for the higher grades is greater than the supply, and therefore large quantities are annually imported from England. The following are analyses of some well-known American potter's clays:

ANALYSES OF POTTER'S CLAYS

1. Washed kaolin, Webster, N. C.; used in porcelain manufacture. 2. Stoneware clay, Greentown, Ohio. 3. Yellowware clay, East Palestine, Ohio. 4. Florida "ball clay," used in whiteware manufacture.

The following varieties of potter's clay are commonly recognized:

KAOLIN OR CHINA CLAY. A white burning residual clay used in the manufacture of china.

BALL CLAY. A plastic white burning clay used as an ingredient of white earthenware and porcelain bodies, and added on account of its plasticity and bonding power.

EARTHENWARE CLAY. Any plastic clay suitable for common earthenware.

STONEWARE CLAY. A plastic potter's clay which burns to a dense impervious body. The clays employed for this purpose are commonly semi-refractory.

YELLOWWARE CLAY. A semi-refractory clay employed for making yellowware. It is not burned to a vitrified body.

RETORT CLAY. A dense burning fire clay much used in some districts for the manufacture of stoneware.

The production of potter's clay in the United States in 1901 was as follows: Kaolin, \$584,523; ball clay, \$68,907; stoneware clay, \$114,613. The imports in the same year were valued at \$969,777.

See CLAY; KAOLIN; PIPE CLAY; POTTERY.

POTTER'S FIELD. A place for the burial of such as have neither friends nor means to provide burial for them. The name comes from Matthew xxvii. 7. See ACELDAMA.

POTTER-WASP. Any wasp of the family Eumenidæ, the species of which form globular cells of clay or sand which are attached by a

▲ POTTER-WASP AND ITS NEST.

small pedestal to some twig. The shape is frequently very beautiful, and is precisely that of certain greatly admired Indian vessels and

baskets. These cells are filled with caterpillars, sawfly larvae, and the larvae of beetles, by the mother wasp, an egg being laid in each cell and the resulting grub feeding upon the stored insects.

POTTERY (from *pot*, AS. *pott*, *pot*, from Ir. *potá*, *puite*, Welsh *pot*, Bret. *pōd*, *pot*; connected with OIr. *ól*, drink, OPruss. *poūt*, Lat. *potare*, Æolic Gk. *πίνειν*, *pōnein*, Skt. *pā*, to drink). Pottery, in the common use of the term, is any kind of ceramic ware which is not especially designated by a name indicating its peculiar properties. (See BRICK; FAÏENCE; MAJOLICA; PORCELAIN; TERRA-COTTA.) A more proper use of the term would be a general one, covering all kinds of wares which are made of clay or clay-like substances and fixed by firing at a high temperature.

MANUFACTURE. The dough-like condition into which clay can be worked with water and the hardness it may be made to acquire by burning are qualities which have been turned to account by man from the earliest times, and it is upon these that the potter's art essentially depends. If a piece of clay be examined, it will be found that it consists of exceedingly minute particles, held together by aggregation when moist; but if dried it can be easily reduced to an impalpable powder by mere pressure; and if, instead of drying, we add an excess of water, it may be so mixed and held in suspension in the water that it appears almost to be dissolved. In time, however, it is deposited as a sediment, and when the excess of water is removed, it is a soft tenacious paste, which is so non-elastic that it will retain the smallest impression made in it without change. This minute division of its particles and the absence of elasticity are its most valuable qualities. Clay also contains water in chemical combination, and this, once expelled by the process of baking, cannot be replaced. Hence it is that while sun-dried bricks, or adobe, perish in a moist climate, burnt bricks are imperishable. Burnt clay, however finely ground and thoroughly mixed with water, never regains its plasticity. Clays are not of the same purity and quality; the commonest is that of brick fields, which is one of the most abundant substances in nature; but it is so mixed up with iron and other foreign ingredients that, except for bricks, tiles, and the coarsest kinds of pottery, it is not used by advanced peoples.

The purest kinds of potter's clay are called kaolin (q.v.). Pipe clay and potter's clay are more abundant than kaolin. They contain more silica and iron oxide, which gives them their yellow or brown appearance when fired. The general process of preparing clay for the potter's use is described under CLAY. In preparing the finer materials for porcelain, many other operations are required, all having the same object—the extremely minute division of the substances used.

Pottery is grouped into three general classes, according to its color and texture, which in turn depend upon the quality of the clay from which they are made. These are earthenware, stoneware, and porcelain. *Earthenware* includes the coarsest kinds of porous ware, such as flower pots. It is opaque, adheres to the tongue, and can be scratched with a knife. It demands a low temperature in firing, as great heat reduces it to a shapeless mass. If glazed, an opaque or colored glaze is used, or a layer of finer clay is

spread over the surface before the glaze is applied. When an opaque coating formed with tin is applied, the ware is called faience (q.v.) and Delf or Delft ware (q.v.), and when Italian in origin, *mezza-majolica*, and in its finest productions, *majolica* (q.v.). There are other fine forms, having the soft, porous texture of earthenware, but white and covered with a transparent glaze of which the most conspicuous example is Wedgwood's 'Queen's ware.' When the ware is baked much harder and is vitrified throughout, it is called stoneware.

For making vessels of circular form, the potter's wheel was used in all times until the introduction of castings, and is still used very largely. This implement is a revolving horizontal disk on which the lump of clay is 'thrown,' and this lump is shaped by revolution. The disk is revolved by a treadle which the workman operates with his foot, and which is turned through a few degrees of the circle or more rapidly through the whole circle, as conditions require. Into the lump of clay the potter thrusts his thumbs, and by drawing them upward and outward he rapidly reduces the whirling mass to the form of a vessel, the walls of which are drawn up between the fingers and thumbs. The inside is smoothed by pressing a wet sponge against the surface and the outside by a strip of leather, while the vessel is revolving. It is now released from the disk by means of a piece of wire which cuts the clay from the wood, and is then put on a board to dry; when dry, the form may be perfected by turning in a lathe, not unlike the implement used for wood-turning.

The use of 'jiggers' and 'jollies' has greatly increased the rapidity and regularity with which vessels may be shaped. A jigger is a machine carrying a revolving mold in which the clay is shaped by a former which is brought down and held firmly within the mold, the clay having been carefully spread by hand upon the inside surface of the mold. The jigger is used for deep dishes, vases, and the like. The jolly is a similar contrivance used in forming plates and other flat pieces. Jugs and bottles are commonly made in two parts and cemented together before the clay is dry. The clay is usually allowed to dry in the mold, and as the water is drawn off the clay shrinks so that it does not cling to the mold. Such additions as spouts and handles are molded separately and cemented with moist clay before the pieces dry.

Casting is employed in making very fine ware. The plaster-of-Paris mold is filled with liquid clay which is allowed to stand until a thin film is formed around the surface of the mold, after which the rest of the clay is poured out: this process is used for 'egg-shell' porcelain, but also, in rare cases, for fine, hard pottery. The making of these plaster-of-Paris molds is a matter of great delicacy. The model having been designed, a mold is made from it which is divided so that it may be easily removed from the clay. This is called the block mold. From this there is made a cast which is, of course, a replica in plaster of the original model, and from this the working molds are made. After the pieces of pottery have been formed, they are taken to the drying-stove, where they are exposed to a heat of about 85° Fahr. When considered dry, they are placed in great earthen-

ware vessels, called seggars, or saggars, which are so shaped that they can be piled one upon another to a great height. The seggars are often made large enough to hold each a number of pieces of the unbaked pottery, and as these would adhere if they touched one another, a number of curiously shaped pieces of baked clay are used, upon which they rest: these are called watches, cock-spurs, triangles, stilts, etc. Thus, each seggar forms a small oven by itself, and by this means the unequal heating of the pieces is prevented, and they are also protected from smoke. A pile of seggars is called a bung, and there may be forty-eight or fifty bungs in the charge of a kiln. When all this is arranged, the furnaces, of which there are several to each kiln, are lighted. The firing requires from twenty-four to fifty hours, after which the ware is allowed to cool very slowly. See KILN.

The articles are now in the state called biscuit, and still require glazing, and perhaps decorative painting and gilding. (For the process of glazing with salt, see STONEWARE; for the glazing of ordinary pottery, see FAÏENCE.) Many mixtures are used, the essential thing being that the glaze and the body shall be of the same general nature in order that they may contract evenly during the firing. The result of uneven shrinking is seen in the cracking of the surface, called 'crazing;' and the crackle of Oriental porcelain and pottery is deliberately produced in the same way. The different glazes are composed of litharge, flint, feldspar, Paris white, and white clay, applied in the form of 'slip.' The glazing materials are triturated with water, with the same care and by similar means to those employed in forming paste, and are reduced with water to the same milk-like liquidity. Each workman has a tub of the glaze before him; and as the articles of biscuit-ware, either with or without decorations, are brought to him, he dips them in the glaze, so as to insure a uniform coating over them; and, by nice management, he prevents any large drops or accumulations on one part more than another. The porous biscuit-ware rapidly absorbs the moisture, and dries up the thin film of glaze on the surface of the articles, which are again placed in seggars, and carried to the glaze-kiln, where they undergo another firing, which melts the glaze, and converts it into a perfectly transparent glass, all over the surface, and renders any pattern previously printed upon it very plain. The temperature in the glaze or enamel kiln is increased very gradually, and is kept up for about fourteen hours, after which it is allowed to cool slowly, and the articles are taken out completed. So far, this description has applied to the manufacture of pottery and porcelain on a large scale, for general purposes; but when it is applied to more costly and artistic works, very special arrangements are required.

Decoration by means of painting may be applied to pottery on the biscuit, or on the unfired enamel, or on the already fired enamel, or glaze, of whatever nature. The method is limited in its scope, but very permanent. The difficulty is to find colors that will stand the great heat required for firing the glaze. Practically the only color used for a hard glazed ware is cobalt blue; but for the softer glazes the oxides of many metals, as copper, iron, and nickel, may be used.

The above applies especially to porcelain. Painting on the unfired enamel is used in some

of the brilliant modern varieties of faïence. Painting upon the glaze, allowing of almost any combination of colors, is the more common practice in ceramic art generally. Painting under glaze requires great skill and experience, for the appearance of the pigments as they are laid by the painter is altogether different from the resulting effect after the firing. The decoration may be applied with a brush or by a transfer of printing. In the latter process the designs are engraved on copper plates; the colors are specially prepared with a printing oil, and the designs printed on a wet tissue paper, which in turn is laid upon the ware and transfers its pattern to the surface of the clay. After the paper has been washed off, the decoration may be touched up with a brush, if necessary.

When it is desired to avoid sharpness of outline in painted or transferred designs, the process called 'flowing' is sometimes used. Sups of more volatile liquid are placed in the seggars, and the vapor of this, partially combining with the metallic colors, softens their outlines. Sometimes the glaze itself is colored, and brilliant and very much admired effects are produced in this way.

In general the term earthenware is used for common pottery, and this carries with it the general idea of a coarser, a softer, and a less carefully made ware than those specified under different names.

PRIMITIVE WARE. In general, primitive pottery is made from surface soil, sometimes of most unpromising appearance, rather than from the finer and purer grades of clay. Naturally the ware produced from such material is coarse and thick-walled. Some of the crudest types of ware are molded in baskets—indeed, archaeologists find good reason for supposing that the earliest pottery was nothing more than an earthen lining for a basket in which corn or other grains were parched by shaking them with live coals until the material was more or less completely baked. Sometimes the frames of wicker or basketry were burnt off in the firing, in such manner as to leave permanent impressions of the framework. This type abounds in mounds and on other prehistoric sites in the Central and Southeastern United States. In the arid regions, not only in the United States and Mexico, but in South America and on other continents, the early ware was improved far beyond this primitive type, in form and finish as well as in material and manufacture. Some of the aboriginal American ware is graceful in form, elaborate in decoration, and perhaps finished with a more or less siliceous slip; though neither the true clays nor the potter's wheel were known to the pre-Columbian natives. Frequently the forms were fantastic, the utensils grading into elaborate symbolic moldings and votive effigies; while the decorations in color were also largely emblematic. (See MAX, SCIENCE OF, paragraph *Esthetology*.) In beauty of form and color effects, as well as in elaborateness and delicacy of the symbolic designs, aboriginal American pottery may be said to have culminated in the Pueblo region in the Southwestern United States and Northern Mexico; some of the pieces from this region (as shown in the accompanying plate) attest a fairly advanced stage in artistic development. The primitive methods of firing are extremely simple. Ordinarily either a single piece or a small lot is fired outdoors in a shallow

pit with the commonest fuel; sometimes smaller draw pieces are used, ostensibly in a ceremonial way (for to the primitive potter the entire process of manufacture is ceremonial rather than merely industrial), yet in such manner as to test the progress of the burning.

HISTORY. The rough red dishes and pots made by peoples of prehistoric time and by tribes of low civilization all over the world are usually of a substance similar to common flower pots even when they are prettily modeled as to form and painted with circles and lines. Similar wares, but much more delicately designed, have been found in great abundance on the eastern shores of the Mediterranean, in Greece, Crete, and Cyprus, as well as on the mainland of Asia. Every explorer in these regions is likely to discover such pieces by the thousand, the sizes of them varying from lamps and toys weighing an ounce or two up to huge vases intended evidently for the storage of grain, oil, wine, etc., which may sometimes contain a hundred gallons. The form is nearly always simple and appropriate and the curves are graceful and prettily combined. The decoration most commonly applied is in black, in bands drawn around the piece, evidently by the process of revolving it while the brush is held steady; but also by means of circles and other curves, parallel lines, checkers, and the like, and the repetition of the fylfot, swastika, and trisul characters. The red wares of the Kaffirs of South Africa or of the Indians on the Amazon do not differ essentially from the Levantine pieces above described, which we generally call Greek or Greco-Phœnician; but they are never as fine either in shape or applied decoration. The black pottery of the ancient Etrurians is also inferior in beauty to the pieces of the Eastern Mediterranean; and the very similar black vessels found in the tombs of ancient Peru are still more grotesque in form, having but seldom any refined beauty.

A step in the development of decorative pottery is taken when for circles and lines are substituted figures of some significance. This step was taken at an unknown early period in Egypt and at least as early as B.C. 2000 in the Asiatic islands bordering upon the Mediterranean. Greek pieces which may be thought to be of the seventh and eighth centuries B.C. are painted with deer, bulls, and beasts of prey, the rude drawings showing accurate observation. A still further advance is in the painting of the surface with black, while the pattern is left in the original red clay, this process involving a very careful working of the black pigment up to a previously drawn outline. In the ruined temples of Cyprus, statues of life size, and even of heroic or colossal size, made of a hard baked pottery, were found, much shattered, but of a certain Asiatic dignity of design. Rough and triling studies of the human figure or of beasts and birds are found in great abundance; and the probability is that this making of figures in representation of living creatures was only checked by the uneven shrinking in the furnace of the not skillfully prepared clay. The utmost refinement of manipulation is necessary in the making of statues and the like.

The most important later development of the pottery of the Mediterranean nations was in the Greek painted vases which attracted so much attention in the eighteenth century under the name of 'Etruscan' vases, this name being given chiefly

because of the finding of these pieces in Tuscany at an early date. It is quite possible to distinguish the real Etruscan-made pieces from those made by the Greeks of the mother country or by those settled in Sicily and South Italy. These Greek vases are generally classified nearly as the earlier and less artistic pieces have been described above, namely, those decorated with black figures on yellow and unglazed pottery, or with black figures on red, or with red figures on black, these two last named divisions being marked also by a certain lustre or glossiness of surface; then a much more elaborate development of these two processes, the vases being adorned by both these decorative processes and also by one or two other colors, such as a kind of purple or lilac, and, not uncommonly, gilding; and finally, vases whose bodies are covered with a white pigment or gesso-like mass upon which the painting has been done in red, black, and other colors, but which are very perishable as to their decoration, the white and the colors upon it flaking off very easily. It is generally accepted as the finest of all epochs, that in which the figures are in red on a lustrous black background made by painting everything except the actual figures and their accompaniments and attributes. These wares are found signed and their date can be ascertained with some accuracy, being fixed as of the fourth or third century B.C.

It is evident that such wares are not decorative in the sense in which a Chinese porcelain vase is decorative. The presence of two or three such in a room does not affect its general aspect very much. The colors are not glowing nor vivid and the piece does not seize the attention; but the beauty of these vases, drinking-cups, and phials is in their subtlety of form and in the suggestion given by their painted figures of extreme skill possessed by the draughtsman, as if he were of a race of artists doing such work as this on cheap clay bowls with only a small part of his strength. As, however, these paintings are the only ones that have come down to us from Grecian antiquity, they are important in an historical sense apart from their individual charm.

Under the Romans a nearly red ware was made, called Samian, from its resemblance to an earlier pottery made, or found, in the island of Samos. This Roman ware is of a fine smooth clay and its decorations are usually in relief: vine leaves and bunches of grapes, medallions, scrolls, ivy-leaf patterns of Greek form, and architectural ornaments like the egg-and-dart moldings. This ware is found all over the Empire and was evidently in very general use; but there is a doubt about the places of its manufacture; nor has the clay been found anywhere in modern times in great abundance. Dr. Birch says, however, that traces of potteries have been found in many parts of Gaul, that is to say, in modern France, and along the Rhine, and that the sites of such potteries are numerous in Auvergne, as also in Spain. It is possible, of course, that the beds of clay were nearly exhausted before the complete disappearance of Roman civilization.

In modern times, even if these are counted as beginning with the fall of classical civilization, there has been very little pottery of artistic interest which is not accurately to be classed under one of the terms referred to above. The most marked exception is that coarse ware adorned by slip (see SLIP), which is especially identified

with English traditions. These pieces are not often good in form and are manufactured very cheaply; the slip, either poured on from a spouted can or applied in some way equally inaccurate, is allowed to form irregular curving and curling lines on the surface, producing an effect extremely informal and even careless, but associated in our minds with an early and simple art which is always attractive as a form of archaism. Much the most artistic pottery of modern times is that mentioned above as coming from Japan; some of this, thought to be brought from the Province of Bangko, is thin and light and of many shades from a very light gray to a brown, but always without any glaze or lustre and without applied ornament other than small detached patches of enamel-color. Other wares are exceedingly like bronze in their color, their surface, their resonance; and the figures of fabulous animals, the incense-burners and the fire-pots (hibatchi) made of this ware are familiarly known as 'earthenware' bronze. In Europe there is a constantly renewed effort to produce attractive pieces for out-of-door use or for other rough service; garden vases are made of heavy brown ware with or without a slight application of plain color to the surface; garden seats and architectural ornaments for the few modern buildings which allow of that kind of decoration are also produced, sometimes under the name of 'terra-cotta,' but more often, especially when glazed, under the name of majolica, which is obviously a misnomer. It is but seldom that delicate forms appear in these pieces.

On the other hand, there are a number of enterprises on foot, in the United States, for the making of especially designed individual pieces. The greater number of these are devoted to the making of glazed, painted, and otherwise more elaborate wares; some even make a real porcelain; but there are a few which produce hard, unvarnished pottery of excellent form and attractive appearance. There are others in which a highly decorative effect is got by the partial glazing of the piece, and still more by the application of different colored glazes which are allowed to trickle down the sides of the vase as if producing a remarkable combination of soft or brilliant colors, the effect of which is comparable to that of a natural mineral. In the production of these effects much is left to chance; but also much is done by the practiced eye and hand and the trained observation which tells to a minute the safest length of time for the exposure to the heat of the kiln. The proportion of successful pieces is large and those which are the most effective in coloring command high prices.

In France the repeated exhibitions of the lovely pieces of the Japanese potters excite a still more marked interest and a more decided attempt at competing in artistic results with the Oriental workmen. At the Exhibition of 1900 there were at least 20 exhibits of unglazed hard pottery whose only applied ornament lay in certain lines or small surfaces of glaze allowed to run down the surface and then checked by the viscosity of the glaze or by the heat of the furnace in the manner of what are called splashed or flambé. These potteries are found to be so highly vitrified by the great heat of the kiln that they approach stoneware in their composition. This points to an insuperable difficulty in the classification of modern wares; it is impossible to draw the line

between one ware and another, because the exact composition of the paste differs so widely between one and another place of production and is so often kept secret.

BIBLIOGRAPHY. A very great number of books have been devoted to the general subject of ceramic art. But none of these can be said to treat merely of the rough wares that are not to be classified as faïence, majolica, porcelain, and the like. The bibliographies given under all the special terms, for which see the first paragraph of the above article, should be examined. In this place there will be named some general treatises and those works especially devoted to ancient potteries, Egyptian, Greek, and the like.

Of general treatises, Jacquemart, *Histoire de la céramique* (Paris, 1873), is an often cited treatise, and the illustrations, which are very numerous, are well drawn and the subjects well selected. The book by Friedrich Jaenicke, *Grundriss der Keramik* (Stuttgart, 1879), is a very thick octavo, crowded with illustrations and fully indexed, with a great number of reproductions of makers' marks. Marryatt, *Pottery and Porcelain* (3d ed., London, 1868), is a general treatise on modern ware, but does not cover all the ground. For ancient pottery, an admirable standard work is *History of Ancient Pottery, Egyptian, Assyrian, Greek, Etruscan, and Roman* (London, 1873), by Samuel Birch. Among the costly books especially devoted to the Greek painted vases are: Bendorf, *Griechische und sizilische Vasenbilder* (Berlin, preface dated 1868); Lau, *Die griechischen Vasen* (Leipzig, 1877); Dumont and Chaplain, *Les céramiques de la Grèce propre* (Paris, 1888 et seq.); and for slighter or more general treatises the hand-books of Collignon, *Histoire de la céramique grecque* (Paris, 1888); and of A. S. Murray, *Hand-book of Greek Archaeology* (London, 1892) for Greece. There are several books containing the bibliography of pottery in connection with the historical texts and there is a *List of the Works on Pottery and Porcelain in the South Kensington Art Library*, by Soden Smith. The *Bibliographie céramique* of Champfleury (Paris, 1881) is very complete for books published before its own date.

POTTIER, πότ'υά', EDMOND (1855—). A French archæologist, born at Saarbrücken, and educated at the Normal College, and (1877-80) at the French school in Athens. Then he assisted Veyries and Reinach in the excavations at Myrina in Asia Minor, and began to specialize in Greek terra-cottas. He taught at Rennes and at Toulouse, for two years (1884-86), had a course in archæology at the Beaux-Arts and in 1886 entered the employ of the Louvre Museum, where he became adjunct curator and assistant instructor of Oriental archæology and antique ceramics. He was elected to the Académie des Inscriptions et Belles-Lettres in 1899. Besides contributions to archæological journals and to the Daremberg and Saglio *Dictionnaire des antiquités*, Pottier wrote various catalogues of the ceramic collections in the Louvre, *La nécropole de Myrina* (1886, with Reinach), *Les statues de terre cuite dans l'antiquité* (1890), and *La peinture industrielle chez les Grecs* (1898).

POTTINGER, Sir HENRY (1789-1856). A British diplomat, administrator, and soldier, born at Mount Pottinger, County Down, Ireland. In 1804 he secured a cadetship in the East India

Company's military service, and five years later was commissioned by its Indian Government to explore the region between their frontier and Persia. The results of this expedition he published in 1816 under the title *Travels in Beloochistan and Sinde*. In 1841, during the Opium War between Great Britain and China, he was sent as ambassador to the latter country; and after the capture of Amoy and several other important towns, concluded a peace in 1842, which opened five of the principal Chinese ports to British merchants. For these services he was appointed the first British Governor of Hong Kong. On his return to England the next year he received the office of Privy Councilor and a pension of £1500. In 1846 he was appointed Governor of the Cape of Good Hope, but less than six months later he was transferred to the Governorship of Madras, which he held until 1854, when he returned to England.

POTTO (African name). A small brownish-gray West African lemur (*Proedicticus potto*) of the lorises group, remarkable for having a distinct though rudimentary tail and distinct index-fingers. Its body is six inches long, and it has the sluggish habits of its relatives. The name has been transported to South America by the negroes and there applied to the *kuikajou*, a small relative of the raccoons.

POTT'S DISEASE, or **SPINAL CARIES**. A tuberculous inflammation of the bodies of the spinal vertebrae, named after Dr. Percival Pott (q.v.), the surgeon who first accurately described the condition and its nature. In this affection as the tubercular tissue replaces the normal bone-tissue of the vertebrae, softening results together with marked deformity of the spine. This deformity is usually seen as an angular projection or hump in the upper part of the back. It is caused from compression or erosion of the softened bodies of the vertebrae, allowing them to be pressed more closely together, which in turn causes their sharp spinous processes to project posteriorly beyond the line of the spines above and below the affected area. The most common period of development of Pott's disease is in childhood and youth, while the body is undergoing rapid growth. The formation of pus is a not infrequent accompaniment of tuberculosis in the spinal region, as in other localities, and this pus often collects itself together into an abscess, spoken of very often as a *cold abscess* (see **ABSCCESS**), from the fact that the inflammatory reaction present is not severe. These abscesses sometimes point in the back adjacent to the vertebrae, and often occupy the posterior mediastinal space (see **CHEST** and **PLEURA**), where they are known as *mediastinal abscesses*. Occasionally the pus in spinal caries burrows downward beneath the muscles of the back and may appear in the lumbar region, constituting a *lumbar abscess*, or following the *psaos* muscle it may pass forward through the pelvis and appear near the attachment of that muscle in the groin; in this case it is known as a *psaos abscess*. When the disease is located in the cervical vertebrae and an abscess forms, it appears frequently in the pharynx. After recovery takes place in tuberculosis of the vertebrae, ankylosis is present in the joints, involved from adhesions between contiguous bony surfaces. In the treatment of

Pott's disease constitutional measures must receive the most thorough consideration. General hygienic measures must be combined with abundance of fresh air, nutritious food, tonics, massage, and as great amount of exercise as the conditions permit. The surgical treatment consists of immobilization of the spinal column by means of frames, the plaster of Paris jacket, the jury-mast, etc. Such measures attain their results by giving rest to the diseased parts, allaying irritation, preventing attrition and crushing of softened bones, and in limiting the amount of deformity after the disease process has become quiescent.

POTTS TOWN. A borough in Montgomery County, Pa., 40 miles northwest of Philadelphia; on the Schuylkill River, and on the Pennsylvania and the Philadelphia and Reading railroads (Map: Pennsylvania, F 3). It has the well-known Hill School, a public high school library, and a public hospital. The centre of a productive farming and dairying country with considerable mineral wealth, Pottstown is an important manufacturing borough, its iron and steel interests being very extensive. There are several large rolling mills, furnaces, nail works, steel mills, bridge works, agricultural implement works, boiler and machine shops, foundries, and manufacturing of bricks, cigars, etc. The various industries, according to the census of 1900, represented an aggregate invested capital of \$4,923,000, and had a production valued at \$8,111,000. Pottstown was laid out in 1752-53 and named Pottsgrove in honor of its founder, a name that was retained until the incorporation of the borough in 1815, when its present name was adopted. In 1888 the limits of the borough were considerably extended. Population, in 1890, 13,285; in 1900, 13,696.

POTTSVILLE. A borough and the county-seat of Schuylkill County, Pa., 35 miles north by west of Reading; on the Schuylkill River, and on the Philadelphia and Reading, the Pennsylvania, the New Jersey Central, and the Lehigh Valley railroads (Map: Pennsylvania, E 3). It is situated in a remarkably picturesque region, which is much frequented by tourists. The county court-house is the most prominent building in the borough, and there are also the county jail and a public hospital. Pottsville is surrounded by the productive anthracite fields of the Schuylkill coal basin, and is an important coal mining and shipping centre. Its mechanical industries, too, have been developed to a considerable extent, having, according to the census of 1900, invested capital to the amount of \$3,383,000, with products valued at \$5,355,000. The more important establishments include the large plant of the Eastern Steel Company; shops of the Pennsylvania and the Philadelphia and Reading railroads; manufactories of plush, velvet, and wood-working machinery; textile and silk mills; etc. The government is vested in a chief burgess, elected triennially, and a borough council which controls elections of a number of the important administrative officers. The treasurer, auditor, and school directors, however, are chosen by popular vote. Pottsville was settled about 1800, was laid out as a town by John Pott in 1816, and in 1828 was incorporated as a borough. It became the county-seat in 1851. Population, in 1890, 14,117; in 1900, 15,710.

POTTSVILLE CONGLOMERATE. The name given to a hard, siliceous conglomerate composed of quartz pebbles and sand and occurring at the base of the lower coal measures. In the central portion of the Pennsylvania anthracite region it has a thickness of 800 to 1700 feet, but is less than 300 to the northward and westward. In New York it is known as the Olean conglomerate. See CARBONIFEROUS SYSTEM; COAL.

POTVIN, pô'vân', CHARLES (1818-1902). A Belgian author, born in Mons. He studied at Liège, entered political journalism as an editor of *La Nation*, and founded *La Belgique Démocratique* (1849) and *Revue de Belgique* (1862). In these influential positions he was a power in Belgian politics and literature, a leader of democrats and free-thinkers. Potvin lectured on the history of literature in the Royal Industrial Museum for some time; was elected to the Belgian Academy in 1881; and in 1883 became curator of the Wiertz Museum in Brussels. He wrote such poems as: *Poésies et amours* (1838); *Le chansonnier belge* (1850); *La Belgique* (1859); on politics: *L'Eglise et la morale* (1858, under the pseudonym *Dom Jacobus*); *La nationalité belge* (1859); on history, *Albert et Isabelle* (1861); *Le Jubilé d'un faux miracle* (1874, under the pseudonym *Dom Liber*); and *De la civilisation en Belgique* (1885); in literary criticism: *Nos premiers siècles littéraires* (1870); *De la corruption littéraire en France* (1873); and *Histoire des lettres en Belgique* (1882); some biographies; and in Old French, *Baudouin de Condé* (1863); *Perceval le Gallois* (1866-72); and *Le Roman de Renard* (in modern French verse, 1860).

POUCHED MOUSE, or POUCHED RAT. Any small rodent with well-developed cheek pouches, especially in America a 'pouched' or 'pocket' gopher (q.v.), or one of the smaller mouse-like animals of the family Saccomyidae. In other parts of the world the term may refer to some true rat, or a hamster, or, in Australia, to a marsupial, especially one of the little mouse-like phalangers of the genus *Dromicia*.

POUDRETTE, pô'drèt' (Fr., small, fine powder). A name apparently first applied to a dry pulverulent manure prepared from the sediment from sewage-settling basins at Montfaucon, near Paris. The term is now applied to any dry mixture of night soil or sewage sludge with absorbent substances, such as charcoal, peat, gypsum, etc. It contains comparatively small amounts of the actual fertilizing constituents, unless, as is sometimes done, it is mixed with more concentrated fertilizing materials, such as dried blood, phosphates, potash salts, etc. Poudrette is prepared and used to a larger extent on the Continent of Europe than in England or the United States. The demand for it has declined since the general introduction of the more concentrated, convenient, and effective commercial fertilizers.

POUGHKEEPSIE, po-kîp'sî. A city and the county-seat of Dutchess County, N. Y., 74 miles north of New York City; on the east bank of the Hudson River, on the New York Central and Hudson River and other railroads, and connected by ferry with the West Shore Railroad, on the opposite side of the river (Map: New York, G 4). A noteworthy cantilever bridge, completed in 1889, spans the

Hudson at this point. (See BRIDGE.) Poughkeepsie is situated partly on a plateau at an elevation of about 200 feet above the river, and partly on the slope to the river. It is well known as the seat of Vassar College (q.v.), whose fine buildings and grounds are some distance east of the city. It has also a number of schools for secondary education, and the Eastman Business College. The Adriance Memorial Library contains more than 24,000 volumes. Besides the Hudson River State Hospital for the Insane, two miles north of Poughkeepsie, there are the Vassar Brothers Institute, Pringle Memorial Home, Saint Barnabas Hospital, and several other institutions. College Hill Park contains 100 acres, and from its highest point commands a fine view of the picturesque surroundings.

The manufacturing interests of Poughkeepsie, according to the census of 1900, represented a capital of \$5,688,000, with products valued at \$6,827,000. Among the important establishments are mowing machine works, foundries and machine shops, a shoe factory, patent medicine factories, slaughtering houses, tobacco, cigar, and cigarette factories, cooperage shops, and lumber mills. The government is administered under a revised charter of 1900, which provides for a mayor elected every two years, and a unicameral council. The majority of administrative officials are appointed by the mayor, whose nomination of members of the board of health, however, are made with the consent of the council. The water-works are owned and operated by the municipality. The Dutch made a settlement about 1698 on the site of Poughkeepsie, which was called by the Indians *Apokeepsing* (safe harbor). During the Revolutionary War (after 1778) it was the State capital, and here in 1788 met the State convention which, under the influence of Alexander Hamilton, ratified the Federal Constitution. The village was incorporated in 1799 and a city charter was granted in 1854. Population, in 1890, 22,206; in 1900, 24,029.

POUGIN, pô'zhân'. ARTHUR (1834-). A French musical and dramatic critic and writer. He was born at Châteauroux (Indre), and studied music at the Paris Conservatory under Alard (violin) and Reber (harmony). In 1855 he became conductor at the Théâtre Beaumarchais, and afterwards leader at Musard's concerts. He was also sub-conductor at the Folies-Nouvelles. From 1860 to 1863 he was first violin at the Opéra Comique. He was in turn *feuilletoniste* to the *Soir*, *Tribune*, *L'Événement*, and *Journal Officiel*, besides being a frequent contributor to *Le Ménestrel*, *La France Musicale*, *L'Art Musical*, *Le Théâtre*, and *Chronique Musicale*. He is a prolific writer, and a sound critic, his biographical sketches being especially sympathetic. His work in connection with Fétis's *Biographie universelle*, for which he prepared a supplement (two volumes 1878-80), has, however, been found to be lacking in thoroughness.

POUILLET, pô'ya', CLAUDE SERVAIS MATTHIAS (1790-1868). A celebrated French physicist, born at Cusance, in the Department of Doubs. He was educated at the Ecole Normale and later was an instructor in this same school. He became professor of physics at the Collège Bourbon, then at the Ecole Polytechnique, and later of the Faculté des Sciences. In 1829 he was

elected sub-director and in 1831 director of the Conservatoire des Arts et Métiers. In 1849 he resigned his various positions and devoted himself to the study of physics. Pouillet is best known as the author of a text-book of physics which was translated into German by J. H. J. Müller, and has passed through many editions; as the inventor of the tangent and sine galvanometers; and for his work on solar radiation, in the course of which he invented a form of pyrheliometer which is still in use. His other work in physics was wide and included such subjects as the measurement of high and low temperatures, measurements of extremely short intervals of time, the latent heat of vapors, etc.

POUILLET, EUGÈNE (1835—). A French lawyer, born in Paris. He was admitted to the bar in 1858, in 1861 was made secretary of the Conférence des Avocats, and subsequently to the lawyer Etienne Blanc, and became known as an authority in patent and copyright law. He appeared in numerous important cases, and published a valuable series of works, including such titles as: *Traité théorique et pratique de la propriété littéraire et artistique* (2d ed. 1894); *Traité théorique et pratique des dessins et marques des fabriques* (3d ed. 1899); and *Traité théorique et pratique des brevets d'invention* (4th ed. 1899). A collection of his verse appeared in 1872, *Poésies nouvelles*, under the pseudonym E. Pevénil.

POUJOULAT, ΠΩΨΖΗΘΩΨΛΑΨ, JEAN JOSEPH FRANÇOIS (1800-80). A French historian, born at La Fare (Bouches du Rhône). He went to Paris in 1826, assisted Michaud in his *Bibliothèque des croisades*, and traveled with him in the East. In the Constituent Assembly of 1848 and the Legislative Assembly of 1849 he was a member of the Right. His extreme royalism made him hostile alike to Louis Philippe and to Napoleon III., after whose coup d'état in 1851 Poujoulat retired from public life. He wrote: *Correspondance d'Orient* (1833-35, with Michaud); *Histoire de Jérusalem* (1840-42; 5th ed. 1865); *Histoire de la révolution française* (1848; 6th ed. 1877); *Souvenirs d'histoire et de littérature* (1868 and 1886); and *La Bédouine* (1835), a novel crowned by the Academy.

POULPE. A French name for an octopus, specifically the common species of the Mediterranean (*Octopus vulgaris*). The term has passed into literature with a rather indefinite application to any cuttlefish, and sometimes even to polyps—a totally different sort of animal. The most conspicuous case of its use and misuse was by Victor Hugo in *The Toilers of the Sea*, where an animal is described under this name which combines characteristics and habits so totally diverse as to make the whole story zoölogical nonsense.

POULTICE (from Lat. *puls*, Gk. *πόλος*, *polos*, porridge), or CATAPLASM. A soft mass composed of substances such as slippery elm bark, meal, flaxseed, bread, herbs, or mustard, for application to the surface of the body. The mass is mixed with hot water and spread to the thickness of about half an inch upon linen, cheesecloth, or even paper. Poultrices may be employed for their heat alone or as vehicles for some therapeutic agent. In the early stages of an inflammation a poultice will assist nature in softening and absorbing inflammatory products, and when

the inflammatory process has advanced they will hasten pus formation. Poultrices of green soap are often employed before surgical operations to soften and sterilize the skin. Cold poultrices, as those of cotton, steeped in water, are sometimes applied to prevent inflammation and mitigate pain.

POULTON, EDWARD BAGNALL (1856—). An English scientist, born at Reading. He was educated at Jesus College, Oxford, in 1877-79 was demonstrator under Professor Rolleston in the anatomical department of the University Museum, and from 1880 to 1889 was lecturer in natural science and tutor in Keble College. He was also lecturer in natural science in Jesus College from 1880 to 1888. In 1893 he became Hope professor of zoölogy at Oxford. He was elected fellow of the Royal Society in 1889, was a member of its council in 1897-99, and in 1898 became a fellow of Jesus College. In 1894 he delivered at Boston, Mass., a course of Lowell lectures on "The Meaning and Use of the Colors of Animals." He contributed valuable papers to the *Proceedings* of the Royal Society and of the Zoölogical Society, to the *Quarterly Journal* of the Geological Society and of the Microscopical Society, and the *Transactions* of the Entomological Society and the Linnæan Society. Among his published volumes are *The Colors of Animals* (1890; in the "International Scientific Series") and *Charles Darwin and the Theory of Natural Selection* (1896).

POULTRY (OF. *pouleterie*, from *poulet*, *poulette*, *polette*, Fr. *poulette*, pullet, fowl, diminutive of *poule*, from ML. *pulla*, hen, fem. of Lat. *pullus*, young animal, chicken; connected with Gk. *πῶλος*, *pōlos*, Goth. *fula*, OHG. *folo*, Ger. *Fohlen*, AS. *folu*, Eng. *foal*). A collective name for useful domestic birds. It is sometimes limited to the domesticated gallinaceous birds—chickens, peafowl, guinea-fowl, turkey, guan, and pigeon—but its ordinary use includes ducks, geese, swans, and all other birds reared for economical purposes. Under the influence of domestication the group has exhibited a great capacity for variation in externals, as color, combs, etc., and especially in size, as appears when the diminutive bantams are compared with great shanghais, and to this capacity for adaptation the usefulness of fowls is largely due. See GALLINÆ; FOWL; and the names of the various birds, as DUCK, TURKEY, etc.

POUND. See WEIGHTS AND MEASURES.

POUND (variant of *pond*, from AS. *ge-pyn-dan*, to shut up, impound). An inclosure for the temporary confinement of stray animals. Where domestic animals stray upon the public highways, or upon the land of individuals, any person injured thereby may take possession of and 'impound' them, that is detain them in a pound until the owner pays him for any damage they may have caused. A pound may be one established by law, known as a public or common pound; or where there is no public pound, a person on whose land cattle or other domestic beasts stray may confine them in an inclosure on his own land, with the intention of thereby impounding them. In the latter case, the person so confining the animals is responsible for them. To obtain a release of the beasts the owner must pay him for their keep, as well as for the damage they have done.

DOMESTIC FOWLS

- 1 DORKING HEN
- 2 SILVER SPANGLED HAMBURG COCK AND HEN
- 3 BLACK MITHORCA COCK
- 4 WHITE WYANDOTTE HEN
- 5 BARRED PLYMOUTH HEN
- 6 WHITE CRESTED BLACK POLISH HEN
- 7 PARTRIDGE COCHIN COCK
- 8 RED GAME COCK

Where cattle are taken to a public pound the person taking them should leave with the poundkeeper a certificate, containing a brief statement of the cause of impounding, and the amount of damages he claims. The poundkeeper then becomes responsible for the keep of the animals. The compensation of the poundkeeper is usually derived from fees, which must be paid by the owner before the poundkeeper is obliged to release them. In most States, either the poundkeeper or the person impounding the animals must give notice to their owner if he can be ascertained and found. If the owner does not redeem his animals within a time fixed by statute, or, in absence of such provision, within a reasonable time, after notice, the poundkeeper may advertise and sell the beasts, satisfy all charges against them, and hold the balance to the credit of the owner. Consult Ingham, *Law of Animals* (1898).

POURBUS, pōōr'bus. A family of Flemish painters.—**PIETER THE ELDER** (c.1463-?) was born at Gouda. Three portraits, supposed to be by him, are in the Vienna Gallery.—**PIETER THE YOUNGER** (c.1510-84) was born at Gouda, settled at Bruges, and became a member of the Guild of Saint Luke in 1543. He painted religious subjects and portraits. In the Academy and churches of Bruges there are a number of good works by him.—**FRANS THE ELDER** (c.1540-c.1581) was born in Bruges. He was the son and pupil of Pieter the Younger, and of Frans Floris. He lived principally in Antwerp. His portraits are notable for their fine, mellow color. There are also religious pictures by him in the Ghent Cathedral, the Ghent Museum, the Antwerp Academy and elsewhere.—**FRANS THE YOUNGER** (c.1570-1622) was born in Antwerp. He was the pupil of his father, Frans the Elder. He became Court painter to the Duke of Mantua in about 1600, and afterwards worked at the Court of France, and died in Paris. There are portraits of Henry IV. of France and of Maria de' Medici in the Louvre, Paris, by him; a portrait of Catharine de' Medici (in the Madrid Museum), "Henry IV. Lying in State" (Berlin Museum), portrait groups (Hermitage Museum, Saint Petersburg), and a portrait of himself (in the Uffizi, Florence). He also painted historical pictures. By some critics he is considered a better colorist than his father.

POURCEAUGNAC, pōōr'sō'nyāk', MONSIEUR DE. A bright prose comedy ballet by Molière, in three acts (1669), containing the author's attacks on the medical profession. The hero is a young man of Limoges who goes to Paris in search of a wife and is involved in many trying situations through the plots of the suitor of his lady love. The play is said to have been written in retaliation for Molière's treatment at the hands of the inhabitants of Limoges.

POUR LE MÉRITE, pōōr le mā'rēt' (Fr., for merit). A Prussian order conferred for military and civil distinction. It originated in the Order of Generosity, founded in 1667, and in 1740 was reorganized by Frederick II. into an order of merit. In 1810 it was expressly made a reward for distinction in battle. The decoration is a blue cross of eight points, the arms separated by golden eagles, and bearing the inscription, "Pour le mérite." A civil class was established in 1842 for distinction in battle. The decoration is a

blue band with the name of the order, inclosing a central gold medallion with the Prussian eagle. See Plate of ORDERS.

POURPOINT, pōōr'point, *Fr. pron.* pōōr'-pwān' (OF., *Fr. pourpoint*, from ML. *perpunctum*, quilted garment, from Lat. *perpungere*, to pierce through, from *per*, through + *pungere*, to pierce). A doublet made of quilted cloth, worn for defense both by soldiers and civilians in the fourteenth, fifteenth, and sixteenth centuries. See GAMBESON.

POURTALES, pōōr'tā'lēs', LOUIS FRANÇOIS DE (1824-80). An American naturalist, born at Neuchâtel, Switzerland. He was a pupil of Agassiz, whom he accompanied in 1840 on glacial expeditions in the Alps and in 1847 to America, where in 1848 he entered the United States Coast Survey. In 1851 he assisted in the triangulation of the Florida reef, and from 1854 until his resignation in 1873 was in special charge of the office and field work of the tidal department of the survey. In 1873 he became custodian of the Harvard Museum of Comparative Zoölogy, in which he had previously been assistant in zoölogy. He was the first in the United States to undertake deep-sea dredging, and was an authority on marine zoölogy. The name Pourtalesia was given to a variety of sea-urchin. Pourtales presented his extensive collections to the museum. He was a member of the National Academy of Sciences, and wrote various contributions to the Coast Survey reports, to Silliman's *Journal*, and to the *Proceedings* of the American Association for the Advancement of Science. He published, under the auspices of the museum, several works, including: *Contributions to the Fauna of the Gulf Stream at Great Depths* (1867-68); *Deep-Sea Corals* (1871); *Corals and Crinoids* (1878); and *Report on the Corals and Antipatharia* (1880).

POUSSIN, pōōs'sān', GASPARD (1613-75). An Italian landscape painter, the son of a Frenchman, settled in Rome. He was the pupil of Nicolas Poussin, who had married his sister, and from respect to that great artist adopted his name in place of his own, which was Dughet. He was called by the Italians Gasparo Duché, and he inscribed his etchings, eight in number, in that way. He never left Italy, and lived chiefly in Rome, where he died May 27, 1675. His landscapes are composed in general from studies in the Campagna of Rome and the surrounding country, worked out with the feeling of a mind deeply imbued with classical associations, and tending toward melancholy reflection, by contrasting the glory of the past with the decadence of the present. He excelled in the portrayal of the wind and the storm, the sombre effects of his paintings being increased by the influence of time in darkening the colors. His first period was marked by a certain constraint, but under the influence of Claude Lorraine his style became warmer, and he acquired mastery over light and air. He was a very facile painter; nearly all European galleries possess examples of his works, which are especially numerous in the public and private collections of Rome, Vienna, and London. His most ambitious undertakings were in Rome: the series of frescoes of the Life of Elias, in the Church of San Martina; the cycle of 12 tempera landscapes in the Colonna Palace; and

another of 25 large landscapes in oil in the Doria Pamfili Palace.

POUSSIN, NICOLAS (c.1594-1665). A French painter, the originator of the classic and academic element in French painting. He was born at Villers, near Les Andelys (Normandy), probably the son of a gentleman of Picardy, who had fought under Henry IV. Placed with a Latin master, he preferred design, and having studied, against the wishes of his parents, at Les Andelys under Quentin Varin, he went to Paris. There, under great privations, he worked with Ferdinand Elle and Georges Lallemand. His association with the mathematician Courtois, whose collection of engravings he studied, filled his mind with the fixed determination to reach Rome. After two vain attempts he succeeded, through the aid of an Italian friend, Marini, arriving in Rome in the spring of 1624. Together with the Flemish sculptor Duquesnay, who had been his friend in Paris, and with Allgardi, afterwards one of the greatest Baroque sculptors, Poussin studied antique statues. He also dissected with the surgeon Larchi, sketched after Raphael and Giulio Romano, and made a thorough study of landscape in wanderings about the Campagna. A great admirer of Domenichino, he was admitted to that master's studio and was much influenced by him in composition.

He was at first unsuccessful in Rome, and during a serious illness was taken care of by a countryman, Dughet, whose daughter he married. But through the pictures executed under the patronage of Cardinal Barberini, he became famous, winning in especial the favor of Richelieu, who was the means, after two years of persuasion, of inducing him in 1640 to return to Paris. He was received with high honor, made first painter to the King, and allotted an income of 3000 livres a year. Besides a number of other paintings he produced eight cartoons for the Gobelins and the designs for a scheme of decoration, representing the "Labors of Heracles," for the Louvre. But, ever homesick for Rome, and disgusted with the intrigues of Vouet and others, he returned in September, 1642, passed the remainder of his life there in quiet, unremitting activity, and died November 19, 1665.

Although Poussin learned his art and passed the best part of his life in Italy, he may properly be classed with the French school, into which he introduced the classical element, which even now forms one of its chief characteristics. He exercised the greatest influence upon the French painters who studied at Rome—Claude Lorrain, Lebrun, Mignard, Bourdon, etc. His art may be divided into two periods, the dividing point of which is his sojourn in France in 1640-42. His early manner is more brilliant and facile, and better in color; afterwards his art is more dominated by ideas and rigid in execution. His composition is symmetrical, though not always free; his drawing correct; his coloring has suffered much from the dissipation of surface pigments. In his figure compositions he renders the feeling of the antique as had no man before him, besides which he was, more than any one else, the creator of the classic or heroic landscape, afterwards developed by Claude Lorrain.

Nearly all of the galleries of Europe possess examples of Poussin's works. The Louvre is

richest with 39, among the best known of which are the "Triumph of Flora" (1630); "Philistines Stricken by the Pestilence;" "Eleazar and Rebecca;" two "Bacchanals;" the "Last Supper;" "Orpheus and Eurydice;" "The Shepherds of Arcady," celebrated for its curious inscription *Et in Arcadia ego*, and his own portrait. In the Vatican is his "Martyrdom of Saint Erasmus;" in the Barberini Palace (Rome) the "Death of Germanicus." Other examples are in the galleries of Hampton Court, Berlin, Munich, Dresden, Vienna, the Uffizi (Florence), Madrid (21), and in the private collections of England. His works were engraved by the most celebrated engravers of the day, including Audran, Pesne, and Stella. Consult: Poussin's *Letters* (Paris, 1824); his *Œuvres complètes* (ib., 1845); and his *Life* by Gault de Saint Germain (Paris, 1806); Graham (London, 1820); Genée (Paris, 1823); Bouchitté (ib., 1858); Gandon (ib., 1860); and Poillon (Lille, 1875).

POUT, or HORNED POUT. See **BULLHEAD.**

POUTER PIGEON. A breed of domestic pigeons capable of pulling out the throat and chest enormously by inflating the crop, which it does frequently. See **PIGEON**; and **Colored Plate of PIGEONS.**

POUTRINCOURT, pō'utrān'kōōr', **JEAN DE BIENCOURT** (1557-1615). A French colonizer. He went to Canada in 1603, under the leadership of De Monts, and in 1604 was given a grant of Port Royal. He busied himself principally, however, in trading with the Indians, and his colony suffered in consequence. In 1606 he fortified Port Royal and joined Champlain on an exploring expedition as far as Point Fortune, now the town of Chatham, in the Province of Ontario. His opposition to the Jesuits prevented him from carrying out the French King's wishes in regard to missionary work among the Indians. He returned to France in 1612, sailed again for Acadia after its desertion by the English in 1614, but did nothing for his Port Royal colony, and finally returned to France the same year.

PÓVOA DE VARZIM, pō'vwā dā vār-zēn'. A town of Portugal, in the Province of Entre-Minho-e-Douro, situated on the Atlantic Ocean, 18 miles north of Oporto (Map: Portugal, A 2). It is a bright and lively town and a favorite bathing resort for the people of Northern Portugal and Spain. Its permanent population, consisting chiefly of fishermen, numbered in 1900 12,623.

POWDER. See **EXPLOSIVES**; **GUNPOWDER.**

POWDERLY, TERENCE VINCENT (1849—). An American labor leader, born at Carbondale, Lackawanna County, Pa. He received a common-school education, in 1862 became a switchman for the Delaware and Hudson Railway, in 1864 a car-repairer, and in 1866 an apprentice to the machinist trade in the shops of the company. In 1869 he entered the employ of the Delaware, Lackawanna and Western Railway at Scranton, Pa. He became president of the Machinists' and Blacksmiths' National Union, held several offices in the local and district assemblies of the Knights of Labor (q.v.), and in 1879 was elected General Master Workman of the latter organization. He reorganized the order and greatly furthered its interests, but in 1893 resigned owing to internal differences arising from opposition to his

policy. In 1878, 1880, and 1882 he was elected Mayor of Scranton as candidate of the Labor Greenback Party, and in 1891 Republican delegate-at-large to the projected State constitutional convention. He studied law in 1893-94, was admitted to the bar of Lackawanna County, Pa., in 1894, and to that of the United States Supreme Court in 1901. From 1897 until his resignation in 1902 he was United States Commissioner-General of Immigration. During the Presidential campaigns of 1896 and 1900 he appeared as a Republican stump speaker in the West and South. He assisted in establishing the *Labor Advocate* at Scranton in 1877, regularly contributed to the *Journal of United Labor*, and wrote on economic subjects for various periodicals of the United States and Canada. He was also known as a lecturer, and published *Thirty Years of Labor: 1859-89* (1889-90); *The Labor Movement: The Problem of To-Day* (1890, with James and others); and *Trusts* (1892, with Dodd).

POWELL, pou'el, BADEN (1796-1860). An English mathematician and divine, born at Stamford Hill. He was educated at Oriel College, Oxford, and graduated in 1817 with highest honors in mathematics. He was ordained in 1820 and appointed vicar at Plumstead, in Kent, 1821, but still devoted his leisure time to mathematics. In 1824 he was elected a fellow of the Royal Society, and in 1827 Savilian professor of geometry at Oxford, which he held till his death. He was also involved in theological controversies and wrote some works on this subject. Among his works may be mentioned: *A Short Elementary Treatise on Experimental and Mathematical Optics* (1833); *Revelation and Science* (1833); *A Historical View of the Progress of the Physical and Mathematical Sciences* (1834); *The Connection of Natural and Divine Truth* (1838); *A General and Elementary View of the Undulatory Theory as Applied to the Dispersion of Light* (1841); *Essays on the Spirit of the Inductive Philosophy* (1855); *Christianity Without Judaism* (1857); *The Order of Nature Considered with Reference to the Claims of Revelation* (1859); *On the Study and Evidences of Christianity* (1860).

POWELL, FREDERICK YORK (1850—). An English historian and Icelandic scholar. He studied at Rugby and at Christ Church, where he was law lecturer, tutor, and student, later becoming fellow of Oriel and delegate of the Clarendon Press. But he is better known as an author and a contributor to the *Encyclopædia Britannica* and the *English Historical Review*. With Vigfusson he edited and translated the *Corpus Poeticum Boreale* (1883), *Islandica Antiqua*, and an Icelandic Reader. Alone, Powell wrote *Early England Up to the Norman Conquest*, *Alfred the Great and William the Conqueror*, and *Old Stories from English History* (1894), as well as syllabi for the study of Dante and Shakespeare, and an essay on the sources of *Saxo Grammaticus* in Elton's translation of that work.

POWELL, JOHN WESLEY (1834-1902). An American geologist and anthropologist, born at Mount Morris, N. Y. His parents came to the United States from England a short time before his birth, and his early childhood was passed in

Ohio, Wisconsin, and Illinois. He studied for a while in the Illinois College, at Jacksonville, later at Wheaton, Ill., and still later at Oberlin College, Ohio. When the Civil War broke out he at once enlisted as a private in the Union Army; after short service he rose to the rank of major, and was subsequently offered the commission of colonel, but declined. While serving as major at the battle of Shiloh he lost his right arm. With the close of the war he accepted a position as professor of geology in the Illinois Wesleyan University, at Bloomington, later resigning this to take a similar position in the Illinois Normal University. In 1867 Major Powell visited the Rocky Mountains of Colorado for exploration and research. The following year he organized a party of mountaineers and explored a portion of the Colorado River region, finally going into winter quarters on the White River. On May 24, 1869, the party of ten started on their voyage through the cañon, which lasted over three months and was fraught with great dangers and hardships. The result of this daring voyage brought Major Powell into prominence before the scientific world, and from that time until his death he was an active and conspicuous personage among American scientists. In 1869 he induced Congress to establish a geological and topographical survey of the Colorado River and its tributaries, an undertaking which consumed the following ten years. The establishment between 1865 and 1875 of many surveys of the Western country, which acted independently and often in competition with each other, led Major Powell to attempt a satisfactory adjustment of these surveys under some combined system of operation. As a result of this, Congress in March, 1879, discontinued the separate surveys and established the United States Geological and Geographical Survey, which had Clarence King as its first director. During Major Powell's Western work he gathered much valuable ethnological and anthropological material among the American Indians for the Smithsonian Institution, and in 1876 this appeared in a volume entitled *Contributions to North American Ethnology*. On the retirement of Mr. King from the directorship of the Geological Survey in 1881, Major Powell was appointed his successor. In 1894 he resigned this office to devote himself to the directorship of the Bureau of Anthropology, and to ethnological and philosophical studies. He died at Haven, Me., September 23, 1902.

Major Powell was a member of most of the important scientific societies of the United States, and served as president of the Anthropological Society of Washington and of the American Association for the Advancement of Science. He was the recipient of many honors from foreign societies, among which was the Cuvier prize, awarded to him and his associates on the Survey in 1891. His important contributions to scientific literature include the following: *Exploration of the Colorado River of the West and Its Tributaries* (1875); *Report on the Geology of the Uinta Mountains* (1876); *Report on the Arid Region of the United States* (1879); *Introduction to the Study of Indian Languages* (1880); *Studies in Sociology* (1887); *Canyons of the Colorado* (1893); and *Physiographic Processes, Physiographic Features, and Physiographic Regions of the United States* (1895).

POWELL, MAUD (1868—). An American violinist, born in Peru, Ill. She studied music (1881-85) in Leipzig, Paris, and Berlin, where she was a pupil of Joachim. She was soloist with the orchestras of Thomas, Seidl, Nikisch, and Damrosch, accompanied the New York Arion Club on its European tour in 1892, and played in England and on the Continent in 1898-99. Her playing was marked by intelligent interpretation, an unusual purity of tone, and adequate technique.

POWER (OF. *pouvoir*, *pouvoir*, *poer*, Fr. *pouvoir*, It. *potere*, power, from ML. *potere*, for Lat. *posse*, to be able). In the English and American law of real property, an authority vested in one or more persons enabling them to make valid conveyances of land, irrespective of their having any interest therein themselves. Such a power may be created by any instrument capable of transferring real estate, but it is most frequently conferred by will. It may be *general*, authorizing the person in whom the power is vested (known as the *donee* of the power) to convey to any person whatsoever, including himself, or *special*, where the exercise of the power is restricted to certain persons or classes of persons. The latter is its more usual form.

The will of the person creating the power (known as the *donor*) must be strictly observed, not only as to the persons in whose favor it may be exercised, but also as to the time and mode of its execution, whether during the lifetime of the donee, by deed, or at his death, by last will and testament. The power when duly executed is operative to divest the estate of the person by whom the land is then held and to vest it in one or more others according to its terms. But the deed or will by which this result is produced is regarded not as that of the donee executing the power, but as that of the donor by whom it was created, and it derives its efficacy from the instrument by which the power was created. Its operation, therefore, is to invalidate (or, more properly, to 'revoke') the previously existing title and to substitute the title of the new 'appointee' in its stead. Accordingly, where, as in the ordinary case, the real property is vested in one person and the power of appointment, as it is more fully described, in another, the legal title of the former is held in strict subordination to the power held by the latter, and the due execution of the power will invalidate any conveyance or incumbrance of the property by such owner.

Powers are described as owing their efficacy to the Statute of Uses, which had the effect of transforming into legal estates the equitable interests in land, which, under the former practice of conveying property to one person to the use of another, might have been created by parol appointment. Thus the owner of land might give to another the use thereof, reserving to himself or giving to another the right or power of revoking such use or trust and appointing another in lieu thereof. It will be seen that it needed only the touch of the statute, converting these uses into legal estates, to put into effect the elaborate system of powers above described. This system forms an important and intricate chapter in the law of real property. It has, however, been greatly modified by statute in many of the United States. See Sugden, on *Powers*;

Leake, *Law of Property in Land*; Tiffany, on *Real Property*; Williams, *Real Property*.

POWER (in physics). The work done by a machine or any agency in a unit of time. In the C. G. S. system the unit of power is one erg per second. Other units are, however, in practical use. Such are the 'watt,' or 10⁷ ergs per second, and the 'horse-power,' or 33,000 foot-pounds per minute (this equals 746 watts approximately).

POWER (in mathematics). See EXPONENT.

POWER, TRANSMISSION OF. The processes and methods of transmitting the power generated by prime motors to the machines and mechanisms operated in performing useful functions is one of the most important problems of modern engineering. In practically all cases the power generated by a prime motor (steam-engine, water-wheel, or windmill) has to be transmitted through an appreciable distance to be applied to the machine which utilizes it in performing work. The means by which this is accomplished are various and may be classed as gears or gearing, belts and ropes, compressed air, hydraulic pressure, and electricity.

GEARING is one of the oldest and most extensively used methods of power transmission for short distances. If two cylinders with parallel axes are pressed together and one of them is rotated on its axis, it will drive the other by means of the friction between the surfaces. If actual teeth are formed upon the two cylinders, we have a pair of gear wheels which drive each other by pressure upon the faces of the teeth if the teeth are properly shaped. If the driving gear and the driven gear are of equal diameter, they have the same speed of rotation; if the driven wheel is smaller than the driving gear, it rotates faster, and if it is larger it rotates slower. Intermediate gear wheels are commonly introduced between the driving gear wheel and the driven gear wheel, which may be of the same or different diameters. By the suitable arrangement of gear wheels and proper variations of their relative size and form, the motor shaft speed may be either increased or diminished and the direction of rotation may be changed to any angle with the driving shaft. See illustration of typical gear wheels, in article **GEARING**.

BELTS. Next to gear wheels the most familiar means of power transmission are *belts*. (See **BELT**.) If two cylinders mounted on parallel shafts are set so far away from each other that their surfaces do not touch, one may be driven from the other by encircling both with an endless flat belt of flexible material. The driving power from the motor shaft is transmitted to the driven shaft by means of the friction between the surface of the belt and that of the two pulleys. Change of speed is accomplished by increasing or decreasing the diameter of the driven pulley as compared with the driving pulley. Change in the direction of rotation is accomplished by twisting the belt; thus a horizontal or an oblique pulley can be driven from a vertical pulley. Belt transmission is particularly an American development and is more extensively used in this country than elsewhere. In English practice for many years gearing was preferred to belts, and at present rope drivers are used in England in preference to belts. Rope transmission is similar to belt transmission in principle and operation, but in place of flat belts, embracing smooth-faced pulleys, one or

more parallel endless ropes are used, embracing groove-faced pulleys. Rope transmission, like belt transmission and transmission by gearing, involves the use of shafting as a part of the transmission system. See **SHAFTING**.

The dynamic or wire rope transmission is a special development of rope transmission, whose most familiar example is perhaps the cable railway. The dynamic transmission is especially suited to distances up to about one mile. Water under high pressure (700 to 2000 pounds per square inch and upward) affords a very satisfactory method of transmitting power to a distance, especially for the movement of heavy loads at small velocities, as by cranes and elevators. The system usually consists of one or more pumps capable of developing the required pressure (see **PUMPS AND PUMPING MACHINERY**); one or more accumulators by which a quantity of water may be accumulated at the required pressure (see **ACCUMULATORS**); the distributing pipes, and the presses, cranes, or other machinery operated. (See **HYDRAULIC PRESS**; **CRANE**; **HYDRAULIC ENGINE**.) Systems of hydraulic transmission for general industrial purposes exist in London, Liverpool, Hull, Birmingham, and Manchester, England; in Antwerp, in Holland; in Zurich, and in Geneva, Switzerland; and in many other places.

Air under pressure is one of the most extensively employed means of power transmission at present practiced. Some of the great variety of uses to which compressed air is put at present are listed in the article on **AIR COMPRESSORS**. The system for compressed air transmission usually consists of an air compressor plant, including receivers, for compressing air and storing it under compression (see **AIR COMPRESSORS**), the pipes for conveying and distributing the compressed air, and the drills, hoists, and other motors operated. (See **DRILLS**; **PNEUMATIC TOOLS**; **HAMMERS**; **AIR BRAKES**; **COMPRESSED AIR**; **LOCOMOTIVES**; **PNEUMATIC DISPATCH**.) The longest distance to which air has ever been transmitted in America is three miles, at the Chapin mine, Iron Mountain, Michigan.

The most modern and in some respects the most important means of power transmission is electricity, which is now used for lighting, street railway, and general purposes, in constantly increasing amounts. The system for electric power transmission consists of the generating plant of engines and dynamos (see **DYNAMO-ELECTRIC MACHINERY**), the transmission line wires, cables or bars, and the motors operated. (See **ELECTRIC RAILWAYS**; **ELECTRIC LIGHTING**; **STORAGE BATTERIES**; **TRANSFORMERS**.) One of the earliest attempts at long distance electric transmission was made between Munich and Meisbach, Germany, in 1882. The distance was 32 miles. In 1886 power was transmitted between Creil and Paris, France, 36 miles, and in 1891, on the occasion of the electric exhibition at Frankfort, Germany, power was transmitted from Tauffen to Frankfort, 109 miles. The longest transmission line in America is from Redlands to Los Angeles, Cal., 80 miles. There is also a 24-mile line from Folsom to Sacramento, Cal., and a 35-mile line at Provo, Utah.

BIBLIOGRAPHY. For the best available literature on power transmission, see Kent, *Mechanical Engineers' Pocket Book* (New York, 1900); Flather, *Rope Driving* (New York, 1895); Mark, *Hydraulic Power Engineering* (New York, 1900);

Richards, *Compressed Air* (New York, 1895); Unwin, *Development and Transmission of Power* (London, 1894).

POWER, D'ARCY (1855—). An English surgeon, born in London. He was educated at New and Exeter colleges, Oxford; in 1878-79 was demonstrator of comparative anatomy at University College, London, and in 1878 was appointed a demonstrator of physiology at Saint Bartholomew's Hospital, where he subsequently became assistant surgeon, teacher of surgery, and surgeon in charge of the throat department. In 1883 he was admitted a fellow of the Royal College of Surgeons of England, in which he held the posts of examiner and Hunterian professor of surgery and pathology. He was also appointed assistant professor in the Royal Veterinary College. His published writings include studies of cancer, intestinal obstruction, and other medical subjects, *Memorials of the Craft of Surgery* (1886), a *Life of William Harvey* (1897), and biographies of eminent surgeons contributed to the *Dictionary of National Biography*.

POWER, HENRY (1829—). An English ophthalmologist, born in Nantes, France. He was educated at Cheltenham College and Saint Bartholomew's Hospital, in 1854 became fellow of the Royal College of Surgeons, and afterwards was its vice-president. He served as consulting ophthalmic surgeon to various London charities, and was appointed lecturer on physiology at Westminster Hospital and professor of physiology at the Royal Veterinary College. He wrote *Illustrations of the Principal Diseases of the Eye* (1869), and *Elements of Human Physiology* (1884).

POWER, MARGUERITE. The maiden name of the English society leader Countess Blessington (q.v.).

POWER, (WILLIAM GRATTAN) TYRONE (1797-1841). An Irish comedian, born near Kilmacthomas, County Waterford. He was taken to Wales while a child, and there about 1813 made his first appearance on the stage. He met with little success, however, and for some time filled only minor rôles. In London he made his first success in the part of Larry Hoolagan O'Halloran in 1824, and from that time confined himself almost exclusively to the portrayal of Irish characters. His acting was distinguished by keen wit combined with tender pathos. He made four successful tours in the United States, and was lost at sea on the return voyage of the last trip. In addition to dramatizing several works, he wrote two novels and *Impressions of America* (2 vols., 1835).

POWER OF APPOINTMENT. An authority or power vested in a person to create a new interest or estate in property in favor of some one whom he may select. For example, A may convey land to B for life, with power to appoint some person to whom the property shall go on B's death. A power of appointment is to be distinguished from a power of revocation, which authorizes the donee of the power to divest or destroy an existing estate. Consult Sugden on *Powers*; see also **POWER**.

POWERS, HIRAM (1805-73). An American sculptor. He was born July 29, 1805, on a small farm in Woodstock, Vt. As the farm proved insufficient for its support, his family

moved to Ohio, where the boy first worked in a clock factory. Later he was employed for seven years to model and repair wax figures in a museum in Cincinnati. This occupation led to the making of wax portrait busts of leading men of the time, General Jackson, Daniel Webster, John C. Calhoun, Chief Justice Marshall, and others, which, being modeled from life, brought him into intimate relations with his famous subjects, especially with Webster at Marshfield. In 1837 he carried the plaster casts of his busts to Italy, and to superintend their execution in marble, he established a studio in Florence, where he spent the rest of his life. Within a year he had completed a statue, "Eve Tempted," which met with the approval of Thorwaldsen, and in 1843 he finished the well-known nude female statue, the "Greek Slave," of which many duplicates were made. A bust of "Proserpine," a statue of a "Fisher Boy" (1846), an "American" (1854), and a "Californian" (1858), are in the same style as the "Greek Slave." He made also statues of Franklin (1862), in the Capitol at Washington, and "Jefferson" (1862), of Washington for Louisiana, Webster for Massachusetts, and Calhoun for South Carolina (1850). His best work, however, is in busts. Among the best, besides those mentioned above as modeled in wax, are those of John Quincy Adams, Martin Van Buren (1835), Edward Everett and John Preston (1845), Longfellow and General Sheridan (1865). He had a strong mind and was a realist by temperament, accustomed to face the facts of nature and to represent them in a truthful matter-of-fact way. Consult Tuckerman, *Book of the Artists* (New York, 1867).

POWHATAN, pou'hâ-tân' (c.1550-1618). A famous Indian sachem. His real name was Wahunsoacook, Powhatan being the name of his tribe. Captain John Smith (q.v.) described him in 1609 as a "tall, well-proportioned man, with a sower look, his head somewhat gray, his beard so thinne that it seemed none at all, his age neare sixtie, of a very able and hardy body to endure any labor." He was originally a chief or *werowance* of eight tribes, but gradually gained control over thirty out of the forty tribes in the surrounding country, and, for an Indian, lived with the greatest pomp and ceremony, generally having a guard of 200 warriors about him, and enforcing implicit obedience upon his followers. He lived part of the time at a village, Powhata, near the site of the present Richmond, and part of the time at another village, Weronomoco, in the present Gloucester County, about fifteen miles from Jamestown. In 1607 he held Captain John Smith as a prisoner for a time and was said to have condemned him to death and to have spared him on the intercession of Pocahontas (q.v.). In 1609 Smith and Captain Christopher Newport visited him to secure provisions, and formally crowned him, with much ceremony, as the 'Emperor of the Indies.' Capt. Smith having attempted to capture him, he planned, in retaliation, the destruction of the English, who were saved by the timely warning of Pocahontas. For the most part he was very suspicious of the colonists, but during his later years lived on terms of peace with them.

POWHATAN CONFEDERACY. A confederacy of Algonquian tribes of eastern Virginia, deriving its name from its organizer and ruling

chief, Powhatan (q.v.). The territory of the confederacy comprised all of tidewater Virginia from Chesapeake Bay inland to the falls of the principal rivers, or just west of a line drawn through Fredericksburg, Richmond, and Petersburg, and may possibly have included also the Virginia counties on the eastern shore, although this may be considered doubtful. The tribes included within the confederacy were some thirty in number, of which the Pamunkey, Chickahominy, Nansemond, Nantaughtacund, Potomac, and Wicocomoco were the largest. Their total population was estimated by Smith in 1607 at 2400 warriors, possibly 8000 souls, occupying some 200 villages and small settlements along the streams. The confederacy as it then existed was of recent extension, all excepting those tribes adjoining the site of Richmond and upon the Pamunkey and its branches having been conquered and annexed by Powhatan during his lifetime. It was not until the settlement of Jamestown in 1607 that continuous intercourse between the whites and the Powhatan tribes began. The first contact was generally friendly, but a hostile feeling soon sprang up between the two races, which was fast leading to open warfare when, on account of the marriage of Pocahontas to John Rolfe, Powhatan was induced to make a treaty of peace and friendship with the English. This peace lasted until after his death in 1618, when his successor, Opechancano, organized a conspiracy to drive the whites from the country. On March 22, 1622, the war began with a general massacre in which 347 persons perished and the majority of the scattered settlements were destroyed.

A war of fourteen years' duration ensued, until both sides were exhausted, when peace was made in 1636. The greatest event of this war was the battle of Pamunkey in 1625, when Governor Wyatt engaged and defeated nearly 1000 Indian warriors and destroyed the principal town of the confederacy. In 1644 Opechancano organized a second conspiracy, which began, as before, with a general attack upon the settlements, resulting in the death of about 300 settlers. It was the last effort against the invader. The Indians were already decimated and impoverished and unable to follow up their temporary advantage. Within a year the war was ended by the capture and death of the old chief, and each remaining tribe made what terms it could for itself, and the confederacy came to an end. In 1669 a census showed that the 2400 warriors of sixty years ago had been reduced to 528, a diminution from perhaps 8000 to about 1600 souls, or hardly one-fifth the original number. In the war of Bacon's Rebellion, 1675-76, they were again hunted down like wild animals until the fugitives took refuge in a palisaded fort near the site of Richmond. The fort was stormed, and men, women, and children massacred by the whites. Those who escaped were allowed to live on condition of an annual tribute from each village. In 1684 four chiefs attended as delegates at the making of a treaty at Albany by which the Iroquois agreed to cease their attacks upon the Virginia remnants. This is their last prominent appearance in history. In 1705 they had four towns, the largest being Pamunkey, with about 200 souls. There are now about 600 representatives of the old stock, living chiefly in four communities, viz.: Pamunkey, 140 persons, on a small State reserva-

tion on Pamunkey River, King William County; Mattapony, 50 persons, on another smaller reservation on Mattapony River, in the same county; Chickahominy, 220, along Chickahominy River, in New Kent and Charles City counties; Nansemond, 180, near Portsmouth, in Norfolk County.

All the typical Indian customs of scalping, tattooing, dancing, and medicine men were found among the Powhatan tribes when first known to the whites. They wore very little clothing beyond the G-string for men and a short skirt for women, with a robe for state occasions or in very cold weather. The men commonly shaved the hair on one side and left it flowing loosely on the other. Their houses were wigwams of wagon-top shape, with frame-work of poles covered by bark or mats, sometimes built closely together and surrounded by stout palisades. They cultivated corn, beans, squashes, and tobacco, which, with fish, game, and wild fruits, gave them an abundant subsistence. They were expert at shaping dugout canoes and weaving fish-nets and baskets. The dead were buried in the ground or preserved in a mummified condition in houses built for the purpose. In some cases the bones were gathered up and cleaned for preservation after the body had decayed. They had an elaborate mythology and ceremonial, of which very little is known, with sacred temples guarded by priests. Tribal government was based on the clan system, with descent in the female line. Their history proves that they were brave and expert warriors. Their modern mixed blood representatives are either fishermen or farmers. See VIRGINIA; PAMUNKEY; POWHATAN; OPECHANCANO; POCAHONTAS.

POWN'ALL, THOMAS (1722-1805). An English statesman and colonial official. He was born probably at Lincoln, graduated at Trinity College, Cambridge, in 1743, and soon afterwards obtained a place in the office of the Board of Trade and Plantations. In 1753 he came to New York as private secretary to Governor Osborn. The next year he was present at the Albany Congress, and while there became convinced of the desirability of intercolonial union. About this time he made the acquaintance of Benjamin Franklin, and the friendship then formed lasted until Franklin's death. In 1757 Pownall became Governor of Massachusetts, and shortly afterwards of New Jersey also, but soon resigned the latter office. He was very active in raising troops to fight against the French, and for a time was popular, but ultimately his vanity and love of gay attire and society gained him the ill-will of many. Having grown tired of his office and applied for his recall, he was in 1759 appointed Governor of South Carolina, but he returned to England without visiting that colony. In England he proved himself a staunch friend of the colonists. He contended that they were entitled to the same rights as Englishmen, and proposed a scheme for what would now be called 'imperial federation.' From 1768 to 1780 he was a member of Parliament, and as such denounced the oppressive acts directed at the Americans; but when war broke out he gave some support to Lord North, and opposed Burke's conciliatory bill of November, 1775. Soon afterwards, however, he declared that the colonies were lost forever, urged that to circumvent the French a commercial treaty should be negotiated with the colonists, and in 1780 brought in a bill for mak-

ing peace. By most of his contemporaries Pownall was regarded as a visionary on political matters, but he really possessed profound insight, and he foresaw, among other things, the future preponderance of the English race in America. As a scientist, antiquary, and man of letters he was better appreciated, and was a member of the Society of Antiquaries and of the Royal Society. He wrote on a great variety of subjects. His works include: *Administration of the Colonies* (1764); *Topographical Description of the Middle Colonies* (1776); *Memorial to the Sovereigns of America* (1783); *Hydraulic and Nautical Observations on the Currents of the Atlantic Ocean*, with notes by Dr. Franklin (1787); and *Memorial to the Sovereigns of Europe and the Atlantic* (1803).

POYNINGS, Sir EDWARD (1459-1521). An English statesman. In 1483 he was a leader in the Kentish uprising in behalf of Buckingham in the latter's insurrection against Richard III. His name having appeared in Richard's proclamation, he fled to the Continent, identified himself with the fortunes of Henry, Earl of Richmond (later Henry VII.), and landed in England with the Earl in 1485. In that year he became a Privy Councillor, and in 1492 was sent with a force of 1500 men to reinforce Maximilian I. in the contest with his rebellious subjects in the Netherlands. He effectually did away with rebel privateering, and with the Duke of Saxony captured Sluis. In 1494 he was sent with an army to Ireland as Lord Deputy, with the purpose of completely subjugating the country, and in the same year convoked a Parliament which, under his direction, passed various acts which crushed the Yorkist Party in Ireland and placed the administration of Irish affairs under the direct control of the English Crown and Privy Council. (See IRELAND.) He made two expeditions to Ulster, drove the Pretender, Perkin Warbeck, to Scotland, and was recalled in 1496. Subsequently he held various posts, including that of warden of the Cinque Ports, sat in Parliament, and conducted the negotiations for Henry VIII. when that monarch joined the 'Holy League' against France.

POYNINGS LAW. A statute enacted by the Irish Parliament at Drogheda in 1494. See IRELAND (*History*); POYNINGS.

POYN'TER, Sir EDWARD JOHN (1836—). An English historical and decorative painter and author. He was born in Paris, March 30, 1836, the son of an architect. From 1854 to 1856 he was a pupil of Leigh's Art School in London, and of the Royal Academy, and from 1856 to 1859 he studied in Paris under Gleyre. In 1860 he returned to London, where he has since resided. He was Slade professor of fine arts at University College, London, from 1870 to 1875, when he became director of the art schools at the South Kensington Museum, and in 1894 he was appointed director of the National Gallery. Elected Royal Academician in 1876, in 1896 he succeeded Millais as president of the Academy. Poynter executed some decorative work in mosaic in the House of Parliament, in Saint Paul's Cathedral, and in Westminster Palace, London. He also made two sets of designs for the English coinage of 1894. Among his easel paintings are: "Israel in Egypt" (1867); "Helen of Troy" (1881); "The Meeting of Solomon and the Queen of

Sheba" (1891); "Idle Fears" (1894); and the "Ionian Dance" (1899). His masterpiece, "A Visit to Æsculapius," is considered in point of technique one of the best products of English Classicism. He published *Ten Lectures on Art* (1879).

POYN'TING, JOHN HENRY (1852—). An English scientist, born at Monton, Lancashire. He was educated at Owens College, Manchester, and Trinity College, Cambridge, was demonstrator under Prof. Balfour Stewart in the physical laboratory of the former in 1876-79, in 1878 became a fellow of Trinity College, Cambridge, and in 1880 was appointed professor of physics at Mason College, Birmingham (now the University of Birmingham). His writings include contributions to the *Philosophical Transactions* and the *Proceedings of the Royal Society* on the transfer of energy in the electro-magnetic field, the mean density of the earth, the connection between the electric current and the electric and magnetic induction in the surrounding field, and other topics. His Adams prize essay (Cambridge, 1891) on *The Mean Density of the Earth* was published in 1891. He also collaborated with J. J. Thomson (q.v.) on *A Text-Book of Physics*.

POYSER, poi'zēr, Mrs. A prominent character in George Eliot's *Adam Bede*, a farmer's wife, whose shrewd and humorous sayings are inimicable.

POZHARSKI, pō-zhār'ské, DMITRI MIKHAIL-OVICH, Prince (1578-1642). A Russian patriot, liberator of Moscow from the Polish domination (1610-12). He fought against the Polish invaders, who had helped to place a pseudo-Demetrius upon the Russian throne, and for his successes was appointed Voivode, or administrative official, of Zaraisk. In 1611 he marched upon Moscow against stubborn resistance, but was severely wounded and compelled to retreat. Subsequently he assumed command of the volunteer forces assembled by Minin, a butcher of Nizhni Novgorod. With these he succeeded in expelling the Poles from Moscow, which they had held for two and a half years. He also conducted further campaigns, was appointed boyar in 1613, and was sent to Sweden on a diplomatic mission. Consult the biography by Malinovski (Moscow, 1817).

PÖZL, pōts'l, JOSEPH VON (1814-81). A Bavarian jurist, born at Pechternersreuth. He studied at the University of Munich, and became professor of law at Würzburg in 1845. Two years afterwards, on the appearance of his *Kompendium des bayrischen Staatsverfassungsrechts* (1847), which was in direct opposition to the practices of the Ministry, he was called to the chair of constitutional law at Munich. A member of the Frankfort Parliament of 1848, in 1858 he entered the Bavarian lower chamber, of which he became first president in 1865. His works on Bavarian law are many and valuable; especially important are the *Lehrbuch des bayrischen Verfassungsrechts* (1851, and often reprinted); *Sammlung der bayrischen Verfassungsgesetze* (1852 et seq.); and *Die Gesetzgebung des Königreichs Bayern seit Maximilian II.* (1852 et seq. with Dollmann).

POZZI, pō'tsé', SAMUEL JEAN (1846—). A French anthropologist and surgeon, born at Bergerac. He studied medicine under Broca

in Paris, and in 1883 became head of the Hôpital de Lourcine (afterwards called Broca). Devoting himself to gynecology and the reform of its methods, Pozzi was frequently commissioned by the Ministry of Education to study foreign medical schools in Germany, England, Austria, Italy, and the United States. He founded the French 'surgical congress,' was president of the Surgical Society of Paris, and in 1898 entirely remodeled the Hôpital Broca, making it one of the best equipped hospitals in the world. He wrote on anthropology and comparative anatomy, was chosen president of the French Anthropological Society, and published some valuable works on his medical specialty, including a *Traité de gynécologie clinique et opératoire* (1890; 3d ed. 1897; trans. into German, English, Spanish, Italian, and Russian). In 1898 Pozzi was elected Senator from Dordogne.

POZZO DI BORGO, pō'tsō dē bōr'gō, CARLO ANDREA, Count (1764-1842). A diplomat in the Russian service. He was born at Alata Corsica, March 8, 1764, and studied law at the University of Pisa. He practised as an advocate in Corsica, and won a high reputation for acuteness and eloquence. He was on terms of somewhat intimate friendship with the Bonapartes until his association with Paoli (q.v.) estranged them, and this estrangement became a positive antagonism. Pozzo represented Corsica in the French National Assembly (1791-92), and was one of the moderates. He returned to Corsica, where he again attached himself to Paoli's party; and on the failure of that chief's plans, retired to London. Here he became the agent of the French émigrés; and in 1798 he went to Vienna to promote an alliance of Austria and Russia against France, and accompanied the Russian army in the subsequent campaign of 1799. In 1803 he entered the Russian service as a councilor of State, from this time devoting his whole attention to diplomacy. He was largely concerned in the Russo-Austrian alliance, which was dissolved by the battle of Austerlitz (1805); but after the Treaty of Tilsit, fearing lest Napoleon might insist upon his surrender, he retired to Austria, from which Napoleon in 1809 demanded his extradition. The Emperor Francis refused; but Pozzo retired to England (1810), where he stayed for some time, and then returned to Russia. He was instrumental in bringing about the rupture between Alexander I. and Napoleon, and this was followed by the campaign of 1812. He also brought about the defection of Murat and Bernadotte from the Napoleonic cause; and after the victorious Allies had driven Napoleon across the Rhine, Pozzo, at the congress of Frankfort-on-the-Main, drew up the declaration "that the Allies made war not on France, but on Napoleon." From this time his whole energies were devoted to the task of keeping Alexander inflexible with regard to Napoleon's seductive offers of accommodation; but after his old antagonist's downfall he exerted himself with equal vigor at Paris (where he signed the Treaty of 1815 as Russian Ambassador) and at the Congress of Aix-la-Chapelle (1818) to ameliorate, as much as possible, the hard conditions imposed upon France. His presence in Paris as Russian Ambassador was exceedingly unpopular after 1830, and in 1834 he accepted the post of Russian Ambassador in London. He retired from public life in 1839, and

settled in Paris, where he died, February 15, 1842. His correspondence with Nesselrode (1814-18) was published with an introduction and notes by Count Charles Pozzo di Borgo in two volumes (Paris, 1890-97). Consult also: Maggiolo, *Pozzo di Borgo* (Paris, 1890); Vuhrer, *Notice biographique sur le comte Pozzo di Borgo* (Paris, 1842).

POZZUÓLI, pōt'sōō-ō'lé (Lat. *Puteoli*). A port in the Province of Naples, Italy, situated on the gulf of the same name, 6 miles west of Naples, with which it is connected by rail and by tramway (Map: Italy, J 7). It lies on a hill in a volcanic district, which is exceptionally rich in old Roman ruins of every description, including ancient piers and a few fragments of Cicero's famous villa. The Roman amphitheatre rises on three rows of arches, around which extends an exterior court. The arena is 369 feet long and 216 feet broad, and could be flooded with water for naval contests. Nero entertained guests here with gladiatorial combats, and here Saint Januarius was in vain cast before wild beasts. The curious temple (or perhaps market hall) of Serapis was a square court with numerous small apartments surrounding it. It had 48 huge columns and its portico was graced by a frieze. In the court rose a round temple, with columns. The lower sections of the ruin are below sea level. The purpose and history of the building are in doubt. The famous Solfatara in the immediate vicinity is the oblong crater of a semi-extinct volcano. Sulphurous gases rise in it constantly, and the ground is hollow. Pozzuóli has mineral baths. An excellent cement is made from a peculiar puzzolana earth found about the town. Near Pozzuóli is an important branch of the manufacturing firm of Armstrong & Co. It manufactures cannon and armor plate for the Italian navy and is fostered by the Government. The harbor has of late been improved by the Government. The population in 1901 (commune) was 22,907.

The foundation of Pozzuóli is ascribed to fugitives from Samos in B.C. 528, who called their new town Dicearchia, which Greek name later gave place to the Latin name Puteoli. At first under the sway of Cumæ, and later of Capua, it fell into the hands of the Romans, along with the latter city, in B.C. 338, and was fortified and held by them against Hannibal. After the conclusion of the Second Punic War, the Romans planted a colony there, and the great prosperity of the city began, and continued throughout the Empire. A mole was built, and Puteoli became the great emporium of trade with the Orient. It was also one of the most important cities of Italy for manufactures, and the beauty of its coast and the healing qualities of its sulphur springs enabled it to vie with its neighbors, Baia and Cumæ, as a fashionable watering place.

PRABODHA-CANDRODAYA, prā-bōd'hā chān-drō'dā-yā (Skt., rise of the moon of intellect). A Sanskrit drama of the eleventh century by Krishna Misra, who wrote it for Kirtivarman the Chandella (1056-1116). The drama is in six acts, and is an ardent defense of Vishnuite Vedantism (see *VEDANTA*) against infidelity, Jainism (q.v.), and Buddhism (q.v.). The dramatis personæ are 44 in number, all of them abstract in character, as Maya (q.v.),

Purusha (q.v.), Reason and Revelation with their children Intellect and Science, Hypocrisy and his son Falsehood, Passion, his officer Anger, and his female attendants Delusion and Allurement, while the heretical sects have each a typical representative. The action of the drama, while not rapid, does not drag, and the repeated attempts of Passion and his followers, who quickly captivate the heretics, but fail utterly with Reason and his subjects, to overthrow faith in Vishnu (q.v.), are treated vividly. The play closes with the overthrow of the hosts of Passion and the triumph of Reason. The *Prabodha-Candrodaya* has been edited by Brockhaus (Leipzig, 1845) and in the *Niraya-Sagara* Press Series (Bombay, 1898), and it has been translated into German by Goldstücker (Königsberg, 1842) and Hirzel (Zurich, 1846), and into English by Taylor (Bombay, 1811; reprinted ib., 1893). Consult Lévi, *Théâtre Indien* (Paris, 1890).

PRACTICE (from OF. *practiser*, *pratiser*, *practiquer*, *pratiquer*, Fr. *pratiquer*, to practice, from ML. *practicare*, *praticare*, to perform, from *practica*, business, fem. sg. of Lat. *practicus*, from Gk. *πρακτικός*, *praktikos*, practical, from *πράσσειν*, *prassein*, to do). In general, the acquisition of a special skill or dexterity by frequent performance of an action, or of a special experience by long familiarity with a subject. Psychologically regarded, it is a state of consciousness (see *ATTENTION*), varying in degree with the amount of time and attention devoted to a problem, and characterized in its higher stages by a maximal concentration of attention (together with all the advantages for observation that this insures) and by a maximal capacity of reproduction (extent and accuracy of memory). It is thus the converse of fatigue (q.v.). "To practice is due a steady increase in delicacy of perception and readiness of judgment; to fatigue, a steady decrease in both" (Külpe). The determination of the stage of practice at which one is working is, therefore, of extreme importance in experimental psychology, especially in work of such fineness as, e.g. the comparison of short intervals of time. (See *DURATION*.) Thorkelson, in an investigation of the 'time sense,' distinguishes no less than six degrees of practice, each of which has its characteristic difference limen. (See *DISCRIMINATION*, *SENSIBLE*.) Where an unpracticed observer can discriminate differences of 1/10, an observer in the advancing stages of general practice can cognize differences of 1/12 to 1/15; with complete general practice, differences of 1/15 to 1/18; with advancing special practice, differences of 1/18 to 1/20; with a higher degree of special practice, differences of 1/20 to 1/25; while maximal special practice still remains as the limiting term of the series.

The distinction here made between general and special practice is important. General practice implies a familiarity with problems or actions of the same class or kind as those in hand: thus, any student who has worked in a psychological laboratory may be regarded as 'generally practiced' in experimental psychology, whereas on entering the laboratory he was wholly unpracticed. So any one who has had piano lessons in childhood may be said to be 'generally practiced' in musical appreciation and rendition. General practice furthers accuracy of observation and

power of judgment at large. It does not imply, as special practice does, a peculiar facility for work of a special kind. General practice will assist a man in a general way for work upon the time sense; but special practice must be acquired in the course of that work itself. In the same way, general practice in piano-playing does not assist one, in more than a general way, toward facility in rendering new compositions at sight; this facility must be gained by special practice with such compositions. Hence "general practice increases in direct proportion to special, but the reverse is not necessarily true."

The characteristics which we have assigned to the practiced consciousness—maximal degree and constant direction of attention, delicacy of perception, extent and accuracy of memory, confidence of judgment—are evidently of a functional nature; they tell us nothing of the contents or structure of consciousness. Practice introduces no new contents. It has, however, the effect of narrowing consciousness. The practiced observer is able, by the very fact of practice, to hold himself exclusively to the practiced subject-matter, and to ignore distracting influences. In this respect the structure of the practiced consciousness differs considerably from that of the unpracticed, whose attention is discursive and whose contents are more numerous and disconnected.

BIBLIOGRAPHY. Wundt, *Physiologische Psychologie* (Leipzig, 1893); Külpe, *Outlines of Psychology*, trans. (London, 1895); Titchener, *Experimental Psychology* (New York, 1901).

PRACTICE. In its strict legal sense, the manner or order of conducting civil or criminal actions, with reference to the successive steps necessary to be taken in order to bring the proper parties before the court, and to bring the action or proceeding to a final determination. It is less comprehensive than the term 'procedure,' which includes the greater part of the *adjective* law, that is, the law relating to remedies, as opposed to substantive law, which defines rights. For a more general treatment of the subject, consult: Aldrich, *Equity Pleading and Practice* (2d ed., Boston, 1902); Daniell, *Pleading and Practice of the High Court of Chancery* (6th Am. ed., Boston, 1894); Stringer, *A. B. C. Guide to the Practice of the Supreme Court* (London, 1903); Tidd, *Practice of the Court of King's Bench* (4th American ed., Philadelphia, 1856). See PROCEDURE; PLEADING.

PRADIER, prá'dyá', JAMES (1792-1862). A French sculptor. He was born in Geneva, May 23, 1792, of a family of French Protestant refugees. His talent was discovered by Baron Denon, and the boy educated in Paris under the sculptors Gérard and Lemot. He won the Grand Prix de Rome in sculpture in 1813. Pradier became a prolific sculptor. He made his debut in the Salon of 1819 with a statue of a "Centaur and Bacchante," now in the museum at Rouen. Similar works are the "Toilette d'Atalante" (Louvre), the "Odalisque" (Museum of Lyons), the "Poetry" (1846), the "Three Graces" (Château de Versailles), and "Sappho" (Louvre). His most important works, however, are the decorative figures of the Fontaine Molière, the figures in the spandrels of the Arc de Triomphe, the twelve Victories which surround the tomb of Napoleon at the Invalides, and the statues of the cities of Lille and Strassburg in the Place de la Concorde, all in Paris. He also made the figures

of the Fontaine Louvois; statues of Saints Andrew and Augustin, in the Church of Saint Roch; the statue of Saint Peter in Saint Sulpice; a group of the "Marriage of the Virgin," in the Madeleine; and statues of Cuvier, Baron Gérard, Jean Jacques Rousseau, and Marshal Soult.

Pradier's quiet, elegant, and formal manner had many imitators, and created what may be called the style Louis-Philippe; but his influence disappeared under the Romanticism of the following period. He was made a member of the Institut and professor at the Ecole des Beaux-Arts in 1827. He died at Bougival, June 14, 1852. For his biography, consult Etex (Paris, 1859).

PRADIER-FODÉRÉ, fô'dá'rá', PAUL LOUIS ERNEST (1827—). A French jurist and educator. He was born and educated at Strassburg, and was admitted to the bar in Paris, where subsequently he occupied the chair of public law in the Armenian College. In 1874 he went to Lima on the invitation of the Peruvian Government to reorganize the legal department. Returning after the war with Chile, he became judge in the Court of Appeals at Lyons (1882). Among his works are: *Précis de droit administratif* (1853; 7th ed. 1876); *Principes généraux de droit, de politique et de législation* (1869); *La question de l'Alabama et le droit des gens* (1872); *Cours de droit diplomatique* (1881); and *Traité de droit international public européen et américain* (1885-94).

PRADILLA, prá-dé'lyá', FRANCISCO (1847—). A Spanish historical and genre painter, born at Villanueva de Gallego, Province of Saragossa. He studied art under distressing privations, first at Saragossa, then under Serri in Madrid, until a successful competition secured him a place as pensionary in the Spanish Academy in Rome, of which afterwards he was director (1881-83). The second of his more important works, "Joanna the Mad Following Her Husband's Coffin" (1878, Madrid Museum), of which he subsequently painted several replicas on a smaller scale, was awarded the medal of honor at the Paris Exposition of 1878, and with "The Surrender of Granada, 1492" (1882, Senate Chamber, Madrid), he created a sensation in Rome and won a gold medal at Munich in 1883. His genre scenes from popular life frequently of miniature dimensions and distinguished for subtle characterization, equal his large composition in point of sterling technique. The best of them include "Market Day Near Vigo" (1892); "Washerwomen at the Brook" (Breslau Museum); and "Pilgrims to the Madonna at Genazzaro" (1895). He was the foremost colorist among the Spanish painters of his day, won gold medals also in Vienna and Berlin, and was appointed director of the Madrid Museum in 1896.

PRADO, prá'dó', MARIANO IGNACIO (1826—). A Peruvian soldier and politician, born at Huánaco. In 1854 he took a prominent part in the revolution that overthrew General Echenique, and again in 1865 was a leader in the movement against President Pezet, whose temporizing attitude toward Spain he strongly opposed. He forced Pezet to resign, and was himself elected President. An offensive and defensive alliance with Chile was formed by him, and, having declared war against Spain, he repulsed the Spanish fleet from Callao (May 2, 1866). His posi-

tion was, however, unconstitutional, and he was obliged to flee in 1868. Subsequently he returned to Peru, where he was elected President in 1876, and in 1879 he declared war against Chile. In the latter part of that year he met severe reverses, and sailed for Europe, leaving the conduct of affairs to La Puerta, the Vice-President. Prado was permitted in 1886 to return to Lima, where he took no further noteworthy part in politics.

PRADON, prá'dôn', NICOLAS (1632-98). A French dramatic poet, born at Rouen. Nothing is known of his life except that he came to Paris at an early age and devoted himself to play-writing. His *Phèdre et Hippolyte* (1677) was ordered by the Duchess de Bouillon and her brother, the Duke de Nevers, who were at the head of the plot against the *Phèdre* of Racine. A *claque* was hired to applaud the worse than mediocre play of Pradon at the cost of Racine's, and such was its success that the latter poet gave up the drama entirely. Other works by Pradon are *Pryame et Thisbé* (1674), *Tamerlan* (1675), and *Regulus* (1688). Collections of his works were published in 1679, 1682, and 1700.

PRADT, prêt, DOMINIQUE DE (1759-1837). A French prelate and diplomat. He was born at Allanche, in Auvergne, studied first in a military school, but was ordained priest in 1783, and pursued his theological studies at the Sorbonne, becoming doctor of theology in 1785. Made vicar-general of the diocese of Rouen in the same year, he represented it in the States General of 1789, and, siding with the Clerical Party, was forced to number himself among the 'émigrants' in 1791. After the 18th Brumaire (November 9th), 1799, however, he returned to Paris and was introduced to Bonaparte, who, on becoming Emperor, appointed him chaplain in ordinary, and shortly thereafter Bishop of Poitiers. For his part in negotiating the Treaty of Bayonne, in 1808, by which Napoleon de-throned the House of Bourbon in Spain, he was rewarded with the Archbishopric of Mechlin. Sent to Warsaw as ambassador, in 1812, his failure on this mission turned the favor of the Emperor, and he was retired to his diocese. He now openly embraced the cause of the Bourbons and Louis XVIII. nominated him grand chancellor of the Legion of Honor, but in less than a year he was replaced by Marshal Macdonald and also relieved of his Archbishopric of Mechlin, in exchange for which, however, he received a pension of 12,000 francs from the King of Holland. He retired to his estate in Auvergne, devoted himself to literary pursuits, and, being elected Deputy from Clermont in 1827, sided with the opposition. He renewed his allegiance to the royalist party after the revolution of July. Among his numerous works may be named: *Histoire de l'ambassade dans le grand-duché de Varsovie en 1812* (1815; 9th ed. 1826); *Du congrès de Vienne* (1815); *Mémoires historiques sur la révolution d'Espagne* (1816); *Des colonies et de la révolution actuelle de l'Amérique* (1817); *L'Europe et les colonies depuis le congrès d'Air-la-Chapelle* (1821). Consult De Lastie-Rochegonde, *Dominique de Pradt* (Saint-Armand, 1897).

PRÆCOCES, prêt-kō'sēz (Lat. nom. pl., premature, precocious). Those birds which, like the domestic fowl, run about and look after

themselves, picking up their own food as soon as they are hatched; opposed to 'Altrices.' See BIRD and NIDIFICATION.

PRAED, prêt, Mrs. CAMPBELL. An Australian author. See AUSTRALIAN LITERATURE.

PRAED, WINTHROP MACKWORTH (1802-39). An English poet, born in London, July 26, 1802. He was educated at Eton and at Trinity College, Cambridge, where he was distinguished for his Greek and English verse; was elected fellow of Trinity (1827); called to the bar (1829); sat in Parliament (1830, 1834, 1837); became secretary to the board of control (1834); and afterwards deputy high steward to the University of Cambridge. He died July 15, 1839. Praed was one of the prime movers in establishing a national system of education. His light essays and poems were contributed to various periodicals. As a writer of society verse, Praed stands in the first rank. His typical moods—gay, pensive, and tender—are well represented by "Araminta," "The Vicar," and "My Little Cousins." Consult: *Poems*, ed. with memoir, by Derwent Coleridge (2 vols., London, 1864); selections from the poems, ed. by Cooper for the Canterbury Poets (ib., 1886); and select essays in Morley's *Universal Library* (ib., 1887).

PRÆMUNIRE (Lat., to forewarn). In English law, an offense of the nature of a contempt against the sovereign and his government, and punishable with forfeiture and imprisonment. The name is derived from the first words (*præmunire*, or *præmonere*, *facias*) of a writ originally introduced for the purpose of repressing Papal encroachments on the power of the Crown. The first statute of *præmunire* was passed in the reign of Edward I. The suspension, for the time, of the right of the patron, and the nomination of his own authority to vacant benefices by the Pope, was the immediate cause of various subsequent statutes of *præmunire*, which made it penal to endeavor to enforce the authority of Papal bulls and provisions in England. By later statutes, a number of offenses of a miscellaneous description have been rendered liable to the penalties of a *præmunire*, as (by 6 Anne, c. 7) the asserting, by preaching, teaching, or advisedly speaking, that any persons other than such as are entitled under the acts of settlement and union have any right to the throne of Great Britain and Ireland, or impugning the validity of any acts of Parliament limiting and defining the succession to the throne.

PRÆNESTE, prêt-nēs'tè. The modern Palestina. A very ancient city of Latium, situated on the slope of the hills about twenty miles southeast of Rome. Tradition ascribed its foundation to Telegonus, the son of Ulysses, or to a certain Caenulus, son of Vulcan. It was one of the important cities in the early Latin League, and is first mentioned by Livy (ii., 19, 2) as taking the side of Rome against the other cities of the league in B.C. 499. We hear no more of Præneste until B.C. 383, when the town began to lord it over the allies of Rome, and two years later even dared to declare war on Rome itself. It was soon vanquished and forced to surrender to the Roman dictator, Cincinnatus (B.C. 380). In the Hannibalic war the Prænestines were faithful to Rome and were rewarded with an offer of Roman citizenship, which, with lofty local pride, they refused to accept. They spoke a

dialect of Latin which seemed amusing to the Romans, and their habits were regarded as provincial in the metropolis. During the civil wars Marius made Præneste his headquarters, but the city was taken and destroyed by Sulla (B.C. 82), who rebuilt it with great splendor and settled a Roman colony there. Under the Empire Præneste was a favorite summer resort, on account of its lofty position. Horace (*Odyssey*, iii.; 4, 22) finds equal charm in *frigidum Præneste*, *Tibur supinum*, and *liquida Baiæ*. Præneste was renowned for its large and magnificent Temple of Fortune with an oracle much frequented by worshippers. (Cf. *Sortes Prænestinae*, Cicero, *De Div.*, ii., 41.) During the Middle Ages Palestrina was long a bone of contention between the popes and the powerful Colonna family, and was destroyed in 1436, but afterwards rebuilt. In 1630 Pope Urban VIII. ceded it to the Barberini. Palestrina is now a squalid town occupying approximately the site of the ancient Temple of Fortune; its population is 6100. Besides the Barberini Palace, it contains fine remains of the ancient polygonal walls. The great composer Giovanni Pierluigi da Palestrina was born here.

PRAET, præit, JULES VAN (1806-87). A Belgian statesman and historian, born at Bruges. He studied law at Ghent, was appointed archivist of Bruges, later became secretary to Prince Leopold of Saxe-Coburg, and after the latter assumed the title of Leopold I., confidential adviser in the royal suite. In the various difficulties attending the beginnings of the monarchy he was of great assistance. He wrote a *Histoire de la Flandre* (1828), defective owing to the non-critical use of sources; and *L'origine des communes Flamandes* (1829), of much value. But his most important work is his *Etudes sur l'histoire politique des derniers siècles* (3 vols., 1867, 1874, 1884), an admirable series of essays on European politics, in which the analysis of noteworthy historical personages occupies important place. Consult Wanters, *Notice sur Jules van Praet* (Brussels, 1889).

PRÆTOR (Lat., leader, governor, commander). The title of an important magistrate among the ancient Romans. The name meant originally simply 'leader,' and as such was first applied to the two consuls, after the expulsion of the kings. As a separate office the prætorship was first created in B.C. 366, open only to patricians as a compensation for the consulship, to which plebeians were now made eligible. Thus the patrician prætor was a sort of third consul, and in fact was called 'colleague of the consuls,' and was accompanied by six lictors, as the consuls were accompanied by twelve. In B.C. 337 the prætorship too was thrown open to the plebeians, and became the highest judicial office within the city, and the immediate stepping-stone to the consulship. With the growth of Rome's foreign relations and the increase in the city's foreign population, the judicial business became too vast for one magistrate, and in B.C. 246 a second prætorship was founded. From now on, the original prætor, known as *prætor urbanus*, or 'city prætor,' presided over litigation between Roman citizens, while the 'foreign prætor,' or *prætor peregrinus*, presided over cases where one or both of the litigants were foreigners. In B.C. 227 two more prætors were appointed, for the special administration of af-

fairs in Sicily and Sardinia, while Spain received two more in B.C. 197, and in course of time the number was still further increased, until it reached the maximum of eighteen, among which we hear of *prætores ærarii*, or *ad ærarium*, connected with the national treasury, and *prætores tutelarii*, a sort of judges of probate. The prætorship was ordinarily of annual tenure, and the age required was thirty years. After his year of service in Rome the prætor went as governor to some province.

PRÆTORIAN GUARD (Lat. *prætoria cohortes*, *prætoriani*). The body-guard of the Roman emperors. A *prætoria cohort*, or select guard of the most valiant soldiers, was attached to the person of Scipio Africanus; but it was to Augustus that its institution as a separate force was due. He formed nine cohorts, each consisting of 1000 men (horse and foot), under the command of a præfect; but kept only three of them in Rome, the rest being dispersed in cities not far off. Tiberius, however, assembled the nine cohorts at the capital in a permanent camp, and Vitellius increased their number to sixteen. The prætorians served at first for twelve and afterwards for sixteen years; they received double pay; the privates were held equal in rank to the centurions in the regular army, and on their retirement each received 20,000 sesterces. They soon acquired a dangerous power, which they exercised in the most unscrupulous manner, deposing and elevating emperors at their pleasure. Aspirants for the Imperial dignity found it advisable, and even necessary, to bribe them largely; while those who acquired that dignity without their assistance were accustomed on their accession to purchase their favor by liberal donations. The prætorians, however, had no political or ambitious views; they were simply an insolent and rapacious soldiery, fond of substantial gratifications, and unmindful how they got them. After the death of Pertinax (A.D. 193) they actually sold 'the purple' for a sum of money to Didius Julianus; but in the same year their peculiar organization was entirely broken up by Severus, who formed new cohorts altogether out of the best legions serving on the frontiers, which he increased to four times the number of the old. After several other changes, they were entirely abolished by Constantine (A.D. 312).

PRÆTORIUM. A Latin word, adopted into later Greek, signifying originally the tent of the prætor or general; then the military council gathering there. It also designated the official residence of a provincial governor; after the time of Augustus, any princely house; finally, the Imperial bodyguard. In the New Testament the Greek word is variously rendered, owing to the effort of the translators to convey in each case the local or specific significance of the term. Hence in the Authorized Version it is called 'the common hall' (Matt. xxvii. 27); 'judgment hall' or 'Pilate's house' (John xviii., 28, 33; xix. 9); 'Herod's judgment hall' (Acts xxiii. 35); and 'the palace' or 'Cæsar's court' (Phil. i. 13). The Revised Version renders the term either by its transliterated form 'prætorium' or 'palace.' Whatever building the governor occupied at any time was, by virtue of the fact, the Prætorium. In Jerusalem this was probably the well-known palace of Herod, described by Josephus (*Ant.*, xv., ix., 3). Consult for further details the various commentaries on the passages enu-

merated above, and Ramsay, *Saint Paul the Traveller and the Roman Citizen* (New York, 1896).

PRAGA, prä'gá. A suburb of Warsaw (q.v.).

PRAGMATIC SANCTION (Fr. *pragmatique*, from Lat. *pragmaticus*, from Gk. *πραγματικός*, *pragmatikos*, relating to civil affairs, from *πᾶγμα*, *pragma*, deed, from *πράσσειν*, *prassein*, to do). A solemn ordinance or decree of a sovereign dealing with matters of primal importance and regarded as constituting a part of the fundamental law of the land. The term originated in the Byzantine Empire, and signified a public and solemn decree by a prince, as distinguished from the simple rescript, which was a declaration of law in answer to a question propounded by an individual. The name is given in later European history to several important decrees, of which the principal are: (1) Those issued by the Emperor Frederick II. in 1220 and 1232 confirming certain customary rights of local authority wielded by bishops and nobles in the German Empire. (2) The Pragmatic Sanction of Louis IX. of France asserting the rights of the Gallican Church (1269), a document the authenticity of which has been doubted for a long time and now generally abandoned. (3) An ordinance of Charles VII. of France for the reformation of the Gallican Church issued in 1438 after the Council of Basel. (4) The decree of the Emperor Charles V., issued in 1547, declaring his Burgundian inheritance indivisible and the perpetual appanage of the House of Hapsburg. (5) The ordinance by which the Emperor Charles VI. (q.v.), Emperor of Germany, having no male issue, settled his dominions on his daughter, the Archduchess Maria Theresa. The decree was issued in April, 1713, as a family law of the Hapsburgs, and between 1620 and 1624 was ratified by various national diets under the Austrian Crown, becoming thereupon a part of the organic law. The act provided that in default of male issue to Charles VI., the Austrian territories, which were declared inseparable, should descend in the female line according to the law of primogeniture. To lend greater security to the act, Charles VI. sought to gain first the ratification of the great powers, and to this end Austrian policy was directed during the greater part of his reign. Among the guarantors of the sanction were Great Britain, France, Prussia, Russia, and Holland. Nevertheless, the death of the Emperor was followed by a speedy repudiation of their pledge on the part of a number of the powers, and an attack on the Austrian dominions by Prussia, Bavaria, Saxony, and France, Spain entering into alliance with the last-named power. England supported Austria. The conflict is known as the War of the Austrian Succession. Consult Varenbergh, "La pragmatique sanction de Charles VI., sa garantie et son infraction," in *Académie d'archéologie de Belgique*, vol. xxviii. (Antwerp, 1872). (See CHARLES VI.; MARIA THERESA; SUCCESSION WARS; AUSTRIA-HUNGARY.) (6) The settlement of the succession of the Kingdom of Naples, which was ceded by Charles II. of Spain in 1759 to his third son and his descendants.

PRAGUE, präg (Bohemian *Praha*, Ger. *Prag*). The capital of the Austrian Crownland of Bohemia, situated on both banks of the Moldau, 150 miles northwest of Vienna (Map: Austria, D 1). Excluding the suburbs, Prague con-

sists of seven parts; the Altstadt, on the right bank of the river; the old Ghetto, known as the Josephstadt, and surrounded by the Altstadt; the Neustadt, which incloses the Altstadt; the Kleinseite, on the slopes of the Laurenzberg along the left bank of the river; the Hradschin, the kremlin of old Prague, lying on an elevation northwest of the Kleinseite; the new quarter of Wiscchrad, on the right bank of the river south of the Neustadt; and the industrial quarter of Holeschowitz-Bubna in the northeast.

The Moldau is spanned in Prague by nine bridges, of which the best known is the Karlsbrücke (1357-1507), 546 yards long, with two mediæval towers and many buttresses embellished with statues of saints. They include that of Saint John Nepomuk, who is supposed to have been thrown into the river here by order of King Wenceslas, and is regarded by the Bohemians as a patron saint of bridges. The most interesting portion of Prague is the Altstadt, which has still preserved its mediæval appearance. Its centre is the Grosser Ring, a fine square, with a monument (Mariensäule) erected in 1650 in commemoration of the liberation of the city from the Swedes. On the eastern side of the square stands the old Hussite Teyn Church (begun in the fourteenth century), adorned with two striking towers, and containing the tomb of the Danish astronomer Tycho Brahe, marble statues of the apostles to the Slavs, Cyril and Methodius, and a fine winged altar.

Opposite the Teyn Church is the town hall. It is a handsome building with a tower, and contains the council chamber of the old structure which has been so closely associated with the eventful history of the city. Its balcony is embellished with statues, and the council chamber contains a large painting by Brožík, "Huss Before the Council of Constance." Besides the buildings of the famous university (see PRAGUE, UNIVERSITY OF), the Altstadt contains also the Rudolphinum, a fine Renaissance edifice on the Rudolfs Quai, with a conservatory of music, an art industrial museum, and an extensive picture gallery containing many very good paintings by Bohemian as well as by Dutch, Italian, French, and German masters; the Kreuzherren-Kirche, modeled after Saint Peter's; the palace of Count Clam Gallas (1701-12) in the baroque style; the Kinsky Palace, with a valuable library; the Pulverthurn, a relic of the old wall which once separated the Altstadt from the Neustadt; and the Königshof, formerly the palace of the Bohemian kings, now used as barracks.

The Josephstadt formed the Ghetto of Prague until 1848, but is now inhabited mostly by Gentiles. It is the most densely populated portion of the city and contains the old Jewish synagogue dating from the twelfth century, and the curious Jewish burial ground crowded with ancient tombstones having Hebrew inscriptions and various symbols denoting the tribe of the deceased. The Hradschin contains a vast Burg begun, it is fabled, by Princess Libussa and completed by Maria Theresa. In the council chamber of the Burg is shown the window from which the two Imperial counselors were hurled in 1618—the initial act in the Thirty Years' War. The unfinished Gothic cathedral in the Hradschin was begun in 1344 and its choir completed in 1385. Among the interesting objects in the interior are the marble mausoleum

of the Bohemian kings; the Chapel of Saint Wenceslas, embellished with precious stones and faded frescoes; and the silver monument to Saint John Nepomuk.

In the western part of the Hradschin is the Premonstratensian Abbey of Strahow (founded in the twelfth century), with its Church of the Assumption, containing the tomb of Saint Norbert, the founder of the Order, a valuable picture gallery, a fine library, and a good natural history collection. Among other prominent features of the Hradschin mention should be made of the barracks, formerly the palace of Count Czernin; the Capuchin monastery; the Renaissance palace called the Belvedere, erected by King Ferdinand I. in 1538; the archiepiscopal palace; and the Schwarzenberg Palace. The Kleinsseite, although inferior in interest to the Altstadt and the Hradschin, possesses some buildings of historical and architectural interest. Chief among them are the churches of Saint Nicholas and Saint Thomas; the interesting palace built by Wallenstein in 1623-30, with a fine garden and many valued relics of the great general, and a chapel containing a number of paintings by Dürer and others; the palace of Nositz, with a notable picture gallery; the Lobkowitz Palace, with an extensive library; the hall of the Provincial Diet; and the Supreme Court.

The Neustadt, the largest part of Prague, with its fine streets, its modern public buildings, and the general air and stir of a modern city, presents an impressive contrast to old Prague. It contains the imposing Czech National Theatre, completed in the Renaissance style in 1883; the Bohemian National Museum, with its various collections and library; the new German theatre; the courts of justice, formerly a Rathaus; a number of fine banks and hospitals; an exchange, etc. Among its churches may be mentioned the Maria Schnee-Kirche and the churches of Saint Peter and the Karlshof. In the quarter of Wischegrad is situated the modern citadel built on the site of the old fortress destroyed by the Hussites.

During the latter part of the nineteenth century Prague greatly improved in appearance. It also considerably extended its municipal activity, so that at present it owns the water-works, the gas and electric plants, the markets, etc. The sanitary conditions have improved, and the park area has been enlarged. The administration is in the hands of a burgomaster and two deputies, an assembly, and a council. The municipal budget exceeds \$4,000,000 and the indebtedness \$8,000,000. The fame of Prague as an educational centre dates from the Middle Ages, when its university was the leading institution of higher learning in Germany. During the latter half of the nineteenth century the struggle for supremacy between the Germans and the Czechs, and the development of a national consciousness among the latter, have given a strong stimulus to the intellectual life of the people.

This found its expression in the establishment of many national educational institutions in this, the centre of Czech culture. In 1882-83 was established the Czech university, whose attendance is nearly three times that of the German university here. Many of the secondary schools have also since been duplicated, and show a steady increase in their attendance. Besides the two universities and the twelve German and six

Czech secondary schools, Prague has a German and a Czech polytechnic, seminaries for teachers, a school of art, a noted conservatory of music, and many special schools. The most prominent scientific organizations are the Bohemian Academy of Science, Literature, and Art, founded in 1890; the Royal Bohemian Scientific Association, founded about 1770; and the Society for Literature in Bohemia, founded in 1891.

Situated on one of the chief waterways of Bohemia and at the junction of seven railway lines, Prague is naturally the economic centre of the crownland. Its industries are of a wide range, including the manufacture of various metal products, railway cars, leather, cotton goods, gloves, chemicals, beer, and flour. Prague is a great sugar market, and trades extensively in local manufactures and raw products. The population of Prague proper was 170,521 in 1880, 182,530 in 1890, and 204,478 in 1900. The last figure could have been increased to 385,238 by adding the population of the adjacent suburbs economically connected with the city. A significant fact between 1890 and 1900 was the increase of the Czech element. The Czech population is estimated at 87 per cent. of the total. Over 90 per cent. of the population is Roman Catholic.

HISTORY. Nothing definite is known about the foundation of Prague. As the residence of the kings the town played a prominent part in the early history of Bohemia. The Altstadt obtained municipal rights and was surrounded with walls in the first half of the thirteenth century. The Neustadt was established about a century later. Under the rule of Charles IV., Prague became, with the establishment of the university (1348), one of the principal cities of the German Empire. In the following century, however, it became the theatre of the Hussite wars (see **HUSSITES**), and many of its churches and a part of its fortifications were destroyed. It soon recovered and entered upon a new period of prosperity, which culminated under Rudolph II. In the seventeenth century came the Thirty Years' War, which began with the 'defenestration' of the Imperial counselors at Prague (1618). In the battle of the White Hill, fought close to the city, the forces of Frederick of the Palatinate, the 'Winter King,' were completely defeated by the Imperialists in November, 1620. Prague was taken by the Saxons in 1631 and retaken by Wallenstein in 1632. In 1635 a peace was concluded here between Ferdinand II. and the Elector of Saxony. In 1648 the Swedes captured the Kleinsseite—the last episode of the Thirty Years' War. The city was taken by the French, Bavarians, and Saxons in 1741, and capitulated to Frederick the Great in 1744. Frederick won a victory over the Austrians here in 1757, and then unsuccessfully besieged the city. For the history of Prague during the nineteenth century, see the history of Bohemia. The peace of Prague, August 23, 1866, terminated the Seven Weeks' War between Prussia and Austria.

Consult: Erben, *Statistische Handbücher der königlichen Hauptstadt Prag* (Prague, 1873-95); *Oesterreichisches Städtebuch* (Vienna, 1895); Wirth, *Prag* (Leipzig, 1901).

PRAGUE, UNIVERSITY OF. Prague has two universities, one German, the other Bohemian. Of these, the older and more famous is the

former, which is the oldest of German universities. It was founded by Charles IV. in 1348 on the basis of an older school dating back to the middle of the thirteenth century, and was organized on the model of Paris, with the four faculties of theology, law, medicine, and arts, and all rights and privileges of a Studium Generale. It had also one college, founded by Charles and endowed by Wenceslas IV. The Hussite movement interrupted the remarkable prosperity of the foundation, as Huss was one of the leading spirits of the institution, and rector in 1403. Owing to an order of Wenceslas IV., growing out of the Hussite disturbances, that the Bohemian 'nation' should have three votes to the German one in the university convocation, the Germans seceded and founded the University of Leipzig (q.v.). Others joined Heidelberg and Cologne. The Hussite movement had been joined to a national Bohemian movement, and had developed into a political as much as a religious agitation, and the university from the time of the secession lost its cosmopolitan character, and became more identified with Bohemian interests and development. In 1419 Catholics were expelled from the university, and in the troublous times that followed it lost most of its students and nearly all its property. In the latter part of the fifteenth century, however, the foundation of many colleges in great part repaired this loss. In the seventeenth century its religious complexion was changed, and in 1654 it was united with the Jesuit college, coming under the influence of that Order. The Czech movement of the nineteenth century found expression at the University of Prague, first in the increase of lectures in the Czech language, and eventually in the foundation of the Czech University of Prague, in 1882-83, with the three faculties of law, medicine, and arts, to which theology was added in 1891-92. The Czech university has since that time much outgrown its German rival. The number of students in the German university in 1901 was 1179; in the Czech university, 3184.

PRAIRIAL, *prâ'rê'âl'*. The ninth month in the French Republican calendar, extending from May 20th to June 18th in the years I-VII., and from May 21st to June 19th in the years VIII.-XIII.

PRAIRIE (Fr. *prairie*, It. *prateria*, from ML. *prataria*, meadowland, from Lat. *pratium*, meadow). In general, an undulating, grass-covered plain, as distinguished from a forested plain on the one hand and a semi-arid region or steppe on the other. The name is applied more specifically to the extensive plain which stretches from southern Michigan and western Ohio across Indiana, Illinois, Missouri, Iowa, Wisconsin, and Minnesota, thus including almost the entire area between the Ohio and the Missouri-Mississippi rivers. West of the Missouri River this level expanse is continued by the Great Plains to the base of the Rocky Mountains, while on the east it merges imperceptibly into the Allegheny Plateau. Its surface is unbroken by marked elevations, but the monotony is relieved by the broad undulations and by the channels of the streams tributary to the Ohio, Mississippi, and Missouri, which have been worn down in places so as to expose vertical walls or bluffs 100 feet or more in height. The elevation above sea-level ranges from 300 to 1500 feet. The prairies are underlain by Palaeozoic sandstones and limestones in

nearly horizontal position; but the surface formation is largely of glacial origin and consists of boulder clay and sand more or less rearranged and decomposed by weathering and erosion. A fine sandy deposit resembling the loess of China occurs over wide areas in the Mississippi Valley. The prairies are characterized by a heavy rich soil admirably adapted for the growth of cereals, and while formerly covered only with grass and supporting herds of buffalo and deer, they have been brought under a high state of cultivation. As to the characteristics of their vegetation, prairies may be divided into two general groups: climatic, which include typical portions of the western part of the Mississippi Valley; and edaphic, which are smaller and are developed almost without exception from swamps. Among the theories commonly held to account for the treelessness of the great Western prairies are: (1) the lack of sufficient rainfall; (2) the grazing of animals and the action of fire; and (3) the excessive transpiration, due to wind—all of which prevent the growth of trees. In apparent proof of the first theory, trees gradually disappear as the distance from the seaboard increases, and this change is paralleled by a gradual reduction in the rainfall; of the second, trees have appeared in some parts of Kansas and Nebraska, where cattle-grazing and prairie fires have been stopped; of the third, transpiration is so great, especially during winter, that certain trees cannot be successfully grown unless in situations sheltered from the winds. Perhaps all of these theories are more or less tenable. See UNITED STATES; INDIANA; ILLINOIS; etc.

PRAIRIE, THE. A novel by J. Fenimore Cooper (1827). It is the last of the Leatherstocking series, showing Natty Bumppo in the far West after the Louisiana Purchase opened the country to settlers, and giving a touching account of his old age and death.

PRAIRIE CHICKEN. See GROUSE.

PRAIRIE DOG. A Western American ground-squirrel, two species of which (*Cynomys columbianus*, west of the Rockies, and *Cynomys ludovicianus*, east of these mountains) are locally common from the Canadian to beyond the Mexican boundary of the United States. The prairie dog is about a foot long and of robust form, with strong limbs and claws, well calculated for digging. Its home is the dry upland plains, where it dwells in colonies, whose permanent 'towns' or burrows, each marked by a hillock of earth about the entrance, spread densely over many acres under the natural prehistoric conditions, but now sometimes cover hundreds of square miles. The burrows are deep and extensive, and at first go down at a very steep slope to a depth of 12 to 15 feet, when they suddenly turn and run in a horizontal direction, and here and there branch into chambers, some of which are elevated and form family rooms, while in others fodder is stored, or refuse and dung are deposited. The mound about the hole is packed hard, not only by the tramping of the animals, but by crowding it down with their noses; this hillock prevents water from running into the burrows when the plain is flooded by heavy rains, and also serves as a tower of observation. The prairie dogs feed upon grass and herbage, which is soon exhausted near the burrows, compelling the animals to go far-

ther and farther away for food. This they dislike to do, as it exposes them to attack from enemies; and after a time they prefer to dig a new burrow nearer a supply of food. Thus a 'town' is always spreading and contains many empty burrows. Like other animals habituated to desert regions, they do not drink at all, and the early belief that subterranean pits were dug by them, down to a water supply, has been proved erroneous. Artesian wells within dog-towns have failed to strike water as often as elsewhere. The animals are diurnal and most active morning and evening. They come out daily during the winter, except when it is very stormy; but this practice varies with the latitude and climate.

They are prolific, especially in the southern half of their territory, and would multiply with excessive rapidity were it not for numerous enemies, especially rattlesnakes and other serpents. These are courageously resisted by the prairie dogs, which sound the alarm the moment a snake enters a hole, gather, and proceed to fill the entrance with earth, packing it down, thereby sometimes entombing the snake forever. Probably few snakes go down the passages, which are so steep they could with difficulty climb out, but depend upon lying hidden in the grass and striking down the young squirrels when out at play or in search of food. This is the method of the coyote, kit-fox, wildcat, hawks, and owls, who find the dog-towns a profitable hunting ground. Badgers, however, can, if they will, easily dig up a burrow and devour the helpless family. The worst enemy is the black-footed ferret, a weasel of the plains, which easily penetrates the burrows, and against whose ferocity and skill the squirrels can make little defense. Every prairie-dog town is also tenanted by many little burrowing owls (q.v.).

All these conditions together served in the natural state of things to hold the prairie dogs in check, but the changes brought about by civilization have been so favorable to these little animals, by the reduction of their enemies on the one hand, and the augmentation on the other hand of their food-supplies by the farmers' plantations of meadow-grass, alfalfa, and grain, that they have increased into a very serious pest. Dr. Merriam stated in the *Yearbook* of the United States Department of Agriculture for 1901 that colonies 20 to 30 miles in length were then not rare; and one in Texas was known to cover an area of 2500 square miles, with a probable average of 25 holes to an acre and of one animal to each hole. At this rate the prairie-dog population of this district would be 40,000,000; and on the carefully studied estimate of students that 250 squirrels will devour annually the same amount of grass as a cow, the pasturage consumed by this great colony would support about 160,000 cattle. When such a colony spreads over a district devoted to farming the loss is increased, for the space occupied by their mounds is a waste of valuable land; the animals are likely to cut irrigation canals, draining off the water, and they devour the planted crops, especially of alfalfa. Both the Federal Government and local authorities have tried various methods for relief, but are almost helpless in view of the large spaces between cultivated districts, where the pest can only be overcome by public and united effort, and also by

coöperation among the ranchmen. The squirrels may be killed by poison in various ways; but best by the use of bisulphide of carbon. A teaspoonful of this cheap liquid is placed upon some absorbent substance (a nodule of dry horse-dung or half a corn-cob will serve the purpose well) and dropped down the hole, which should then be stopped with earth. The fumes are heavy, sink into the depths of the burrow, and kill the inhabitants. Bisulphide of carbon is not only poisonous, but inflammable and explosive; it should be kept in cans or bottles, tightly corked, and never opened near fire. See *PLATE OF GOPHERS, LEMMINGS, AND MARMOTS.*

PRAIRIE DU CHIEN, *prā'rē dū shēn*. A city and the county-seat of Crawford County, Wis., 60 miles south of La Crosse; on the Mississippi River, and on the Chicago, Burlington and Quincy and the Chicago, Milwaukee and Saint Paul railroads (Map: Wisconsin, B 5). It has a College of the Sacred Heart, and Saint Mary's Institute for Girls. The ruins of old Fort Crawford, built in 1825, are of historic interest; and the mineral springs in the vicinity make Prairie du Chien of considerable importance as a health resort. It is the commercial centre of a fertile agricultural section, and manufactures woollens, pearl buttons, pickles, barrels, egg cases, veneer, etc. Population, in 1890, 3131; in 1900, 3232.

Near Prairie du Chien a fort seems to have been built by the French as early as 1689, but this was soon abandoned and another was built in 1755. The present settlement dates from 1783. The village and fort were surrendered by the English to the United States in 1786, though they were again captured during the War of 1812 and held until 1816. Prairie du Chien was first incorporated in 1872. Consult: Durrie, *Annals of Prairie du Chien* (Madison, 1872), and an article, "Early Days of Prairie du Chien," in the *Wisconsin Historical Society Collections*, vol. v. (Madison, 1868).

PRAIRIE FOX. The kit-fox (q.v.).

PRAIRIE PIGEON, or **PRAIRIE PLOVER**. A local name in the Western United States for both the golden plover and the upland 'plover' (a sandpiper).

PRAIRIE RATTLESNAKE. The small rattlesnake, or massasauga (*Sistrurus catenatus*), of the prairie regions of the Central United States. See **RATTLESNAKE**.

PRAIRIE WARBLER. A wood-warbler (*Dendroica discolor*) of the Eastern United States, olive-green above, spotted with dull red, and lower parts rich yellow, with conspicuous black streaks upon the cheeks and along the sides of the body. It frequents brushy districts, and its habits, song, nest, and eggs resemble those of the common yellow warbler. Consult Coues, *Birds of the Northwest* (Washington, 1874).

PRAIRIE WOLF, or **RED WOLF**. The coyote.

PRAJĀPATI, *prā-jā'pā-tē* (Skt., lord of beings). The name of a Hindu divinity. In the Rig-Veda the word is used also as an epithet of Savitar (q.v.), the revivifying aspect of the sun, and of the invigorating Soma (q.v.). Prajapati's character was essentially that of a creator, and he thus became not only a synonym of Brahma (q.v.), but also, when Brahma's creative godhood

was to be emphasized, of those divine personages who, produced by Brahma, created all existing beings, including gods and demons. Manu names ten such Prajapatis engendered, through pure meditation, by Brahma, Marichi, Atri, Angiras, Pulastya, Pulaha, Kratu, Prachetas or Daksha, Vasishtha, Bhrigu, and Narada. The Puranas (q.v.) contain many legends about them, together with varying accounts both of their number and origin. In modern India the cult of Prajapati has almost disappeared, although the Kumbars, or potter caste, of the Punjab still worship him. Consult: Muir, *Original Sanskrit Texts* (London, 1868-74); Hopkins, *Religions of India* (Boston, 1895); Macdonell, *Vedic Mythology* (Strassburg, 1897).

PRĀJÑĀ PARAMITĀ, prā'nyā pä'rā-mē-tā (Skt., wisdom which has gone to the other shore; absolute or transcendental wisdom). The title of the principal Sutra of the Mahayana School of the Buddhists. Its main object is metaphysical, and its doctrine is the entire negation of the subject as well as the object, teaching that the supreme good, defined by it as the wisdom which releases from transmigration, has no more reality than he who strives to gain it. The commencement of the work is merely a eulogy of Buddha, and of the Bodhisattvas, who form his retinue. Other parts contain narratives of wonderful phenomena connected with the apparition of Buddhist saints, descriptions of the benefits arising from an observance of Buddhist doctrine, or verses in which the Buddha is praised by his disciples. Both on account of the extent to which such episodic topics could easily be expanded, as well as by reason of the amplifications of the real substance of the work, several recensions of the Prājñā Paramitā are in existence. Some of these do not contain more than 7000 slokas, or distichs, but others amount to 18,000, 25,000, or even 100,000 slokas.

PRĀKRIT, prāk'rit (Skt. *prākṛta*, natural, unrefined, vernacular, from *prakṛti*, element, foundation, from *pra*, before + *kar*, to make). The mediæval popular Aryan languages of India, standing chronologically between Sanskrit and the modern Aryan dialects of the peninsula, such as Hindustani, Gujarati, Bengali, and others. While there were doubtless a great number of Prakrit dialects, we have trustworthy information about very few. According to the *Prākṛta-sarvasva* of Markandeya Kavindra, who wrote probably about the middle of the seventeenth century, there were four main divisions of Prakrit, *bhāṣā vibhāṣā*, *apabhraṃśa*, and *pāśāca*. The *bhāṣās*, or languages proper, included Maharashtra, Sauraseni, Pracya, Avanti, and Magadhi. In his view the Ardhamagadhi was a variety of Magadhi somewhat resembling Sauraseni, while Bahliki also differed little from Magadhi. The *vibhāṣās*, or dialects, comprised Śakari, Candali, Śabari, Abhriki, and Śakki, but not, as some native grammarians held, Odri or Dravidi. The *Apabhraṃśas*, or patois, included twenty-seven dialects, all of which were derived from three, Nagara, Vracada, and Upanagara, although it is not improbable that, as a matter of fact, each literary Prakrit, whether *bhāṣā* or *vibhāṣā*, had its patois, or *apabhraṃśa*, beside it. The *pāśācas*, popularly interpreted as demon languages, but probably originally the dialects of the north or west of India, had eleven varieties, derived, according to Markandeya, from three,

Kaikeya, Saurasena, and Pancala. Of all the Prakrits by far the most important was Maharashtra, which is the one implied by the native grammarians when they speak simply of Prakrit. This is the dialect which is employed sometimes in two slightly modified forms called Arsha or Ardhamagadhi, and Jaina Maharashtra, in the sacred texts of Jainism (q.v.). An important source for the great majority of Prakrits, however, is the Indian drama. According to the conventions of Hindu dramaturgy only the principal male characters speak Sanskrit. The lower male and all the female rôles are in various Prakrits, often corrupted in course of time by careless or ignorant scribes and editors. According to a passage in the Sanskrit rhetorical treatise, entitled the *Śāhityadarpaṇa*, noble women employ in dramatic prose Sauraseni, but in verse Maharashtra, courtiers speak Magadhi, ministers and princes Ardhamagadhi, buffoons Pracya, rascals Avanti, gamblers and citizens Dakshinatyā, woodcutters Paisaca, and so on. On the other hand, women of high birth, their friends, courtesans, and celestial nymphs may speak Sanskrit as well as Prakrit. While there is little doubt that such an elaborate division of Prakrits as we find in the drama was artificial, it finds an analogue in the princely retinues of modern India, where many different districts with diverse dialects are represented in one place. It also leads to the inference that Sanskrit was probably not spoken by all classes of people, although it was intelligible to many who were obliged to reply in the vernacular. Prakrit is not derived from classical Sanskrit (see SANSKRIT LANGUAGE), but from a dialect-group closely akin to Vedic Sanskrit. As analogues between Prakrit and Vedic Sanskrit may be cited the change of intervocalic *d* to *l*, as Sanskrit *garuda*, name of a mythical bird, Prakrit *garula*, cf. Sanskrit *idē*, 'I praise,' Vedic Sanskrit *ile*; instrumental plural in *-ehim*, as Prakrit *vacchēhim*, 'with trees,' Vedic *vrksēbhīh*, but classical Sanskrit *vrksūh*, Prakrit *rukha*, 'tree,' Vedic *rukṣa*, not found in classical Sanskrit.

The chief phonological characteristics of Prakrit are the loss of Sanskrit *r*, the shortening of the Sanskrit diphthongs *ē*, *ō* before consonant groups, the frequent elision of intervocalic *k*, *g*, *j*, *l*, *d*, *p*, *b*, *v*, the common change of medial *kh*, *gh*, *th*, *dh*, *bh* to *h*, the change of *n* to *ṇ* throughout, and of *ś* and *ṣ* to *s* or rarely to *h*, and the simplification of consonant-groups.

In morphology the inflection is characterized especially by the growth of *a*-stems at the expense of the *r*- and consonant stems, as Sanskrit *pitar*, 'father,' but Prakrit *piara*, Sanskrit *karmaṇ*, 'deed,' Prakrit *kaṃma*. The old dual is lost excepting in *dō*, *duvē*, *bē*, 'two;' and the genitive assumes the functions of the dative. The pronominal declension is to a very large extent influenced by the nominal, while in all periods of Sanskrit the two systems are kept distinct. In conjugation there is but one system, apart from some scattered forms, as contrasted with the nine present formations in Sanskrit. Verbs are, therefore, conjugated according to the Sanskrit *a*-class, as Sanskrit *varṭati*, 'turns,' Prakrit *vartāi*. Excepting the past participle, the middle voice has almost disappeared. The tense system is extremely meagre, consisting only of present and future. Of the

imperfect, aorist, and perfect some sporadic examples have survived. These tenses are regularly formed in Prakrit by *bhū* and *as*, 'to be,' with participles, as *gaō atthi*, 'is gone,' Sanskrit *jāgāma* (classical Sanskrit also *gatō 'sit*). The moods are the indicative, optative, and imperative, but the subjunctive, as in classical Sanskrit, is lost. As is natural, the dialects differ much from each other in regard to inflection and frequency of forms. Thus the ending of the second person plural present indicative (*-tha* in Sanskrit) is *-ha* in Maharashtri, Jaina Maharashtri, and Ardhamagadhi, *-dha* in Sauraseni and Magadhi, *-hu* in Apabhramśa; the optative is very common in Ardhamagadhi and Jaina Maharashtri, comparatively rare in Maharashtri, and almost never found in the other dialects. As an example of the difference between Prakrit and Sanskrit a stanza in the Maharashtri dialect from the poet Hala may be cited:

Prakrit.

ajja maē tēna viṇā
aṇhūāsukhāi sām̐bharaṇṭiē
ahinaramchāṇa ravō
nisāmīō vajjhapaḍuḥō vva.

Sanskrit.

adya mayā tēna vinā
aṇbhūtasukhāni samsmarantīyā
abhinaramcchāṇam ravō
niśāmītō vadhyapaṭaha iva.

"Lorn of my love to-day—
But blisses gone, remembering:
The heavy thunders fall
Like dooming drums, on me remembering."

Since the Prakrit forms in the literature have been corrupted in countless instances by ignorant or pedantic scribes, the most trustworthy sources are the native grammarians, especially Hemacandra (edited and translated by Pischel, Halle, 1877-80), the most complete, although rather late, dating about the twelfth century. Vararuci (edited and translated by Cowell, London, 1868, again edited by Tailanga, Benares, 1899), the earliest, and Canda (edited by Hoernle, Calcutta, 1880). The Apabhramśa is treated in the *Prakṛtapīṅgalasūtra*, edited with Lakshmināthabhatta's commentary by Sivadatta and Parab (Bombay, 1894). There are also several grammarians whose works exist only in manuscript, and a lexicon by Dhamapāla, entitled *Pāyialacchī Nāmamālā* (edited by Bühler in vol. iv. of Bezzenberger's *Beiträge zur Kunde der indogermanischen Sprachen*, Göttingen, 1878). The literature proper is quite extensive. It includes not only parts of the Sanskrit drama as well as the Jaina texts already mentioned, but also epic and lyric poetry. The former class is represented by two Maharashtri poems. Of these the first is the *Ścūbandha*, or Building of the Bridge, also called *Rāvaṇavaha*, or Death of Ravana, by an unknown author, but frequently erroneously attributed to Kalidasa (q.v.). It was known as early as the seventh century, and deals, as its name implies, with the Rama cycle. (See RAMAYAṆA.) It has been edited and translated by Goldschmidt (Strassburg, 1880-83) and edited with Ramadasa's commentary by Sivadatta and Parab (Bombay, 1895). The second epic is the *Gāūdavaha*, an historical poem by Bappairra (Sanskrit *Vākpātirāja*) about the

beginning of the eighth century. It has been edited with Haripala's commentary and an index by Pandit (Bombay, 1887). The lyric is represented by the *Sattasai*, or Seven Centuries, by Hala who lived probably between the third and seventh centuries, at any rate before 1000. This collection of lyrics, many of which are of much beauty, has been edited and translated by Weber (Leipzig, 1881) and again edited with Gangadharabhatta's commentary by Durgaprasad and Parab (Bombay, 1889). In the drama we have the *Karpūramāñjari* of Rajasekhara (q.v.), edited with Vasudeva's commentary by the same scholars (ib., 1887) and again edited with a masterly English translation by Konow and Lanman (Cambridge, Mass., 1901). Other works were composed in Prakrit, such as the *Bṛhatkathā*, or Great Story, of Guṇadhya, now lost, which formed the basis of Somadeva's *Kathāsaritsāgara*, and was written in Paisaca dialect, while the *Gitagōvinda* of Jayadeva (q.v.) was apparently adapted from an Apabhramśa original.

Consult: Hoefler, *De Prakrita Dialecto* (Berlin, 1836); Lassen, *Institutiones Linguae Praeriticae* (Bonn, 1837); Delius, *Radices Praeriticae* (ib., 1839); Muir, *Original Sanskrit Texts*, vol. ii. (3d ed., London, 1874); Cowell, *Short Introduction to the Ordinary Prakrit of the Sanskrit Dramas* (ib., 1875); Rishikesh Sastri, *Prakrita Grammar* (Calcutta, 1883); Lal Chandra, *Prakrit Grammar* (Benares, 1901); Pischel, *Grammatik der Prakrit-Sprachen* (Strassburg, 1900); Hoernle, "Sketch of the History of Prakrit Philology," in *Calcutta Review*, vol. lxxi. (Calcutta, 1880); Haag, *Vergleichung des Prakrit mit den romanischen Sprachen* (Berlin, 1869); Gray, *Indo-Iranian Phonology* (New York, 1901); Jacobi, *Ausgewählte Erzählungen in Māhārāshtri* (Leipzig, 1886).

PRAKRITI, prā'krē-tē (Skt. *prakṛti*, element, foundation). In Hindu philosophy, potential matter, which must be carefully distinguished from nature, for it exists only conditionally, and develops consciousness only when beheld by Purusha, or Man, who may thus be called the efficient cause of the world as contrasted with its material cause, Prakriti. The union of these two principles gives rise to Buddhi, or perception (also called Mahat, or the great), as well as to Ahankara, or belief in the existence of the ego, and the Tanmatras, or elements of the senses, both in their subjective and objective aspects, to which manas, or perception, is added. Prakriti is uncreated and is coeternal with Brahma (q.v.). Manas, the five Tanmatras, Buddhi, and Prakriti are often called the eight Prakritis, the first seven being productive as well as produced, while the primal Prakriti has the distinctive epithet *aryakta*, or unmanifested. Consult Müller, *Six Systems of Indian Philosophy* (New York, 1899).

PRAM, prām, KRISTEN HENRIKSEN (1756-1821). A Danish poet and editor, born in Norway of Danish parents. He was a man of wide learning and great mental activity. The number of his works, however, is much greater than their value. Of his poems, there need be mentioned only *Emilies Kilde*. His principal work was done for the *Minerva*, a monthly critical journal published in Copenhagen, of which he was one of the founders. He was sole editor

from 1790 until Rahbeh took charge in 1794. His works were edited by Rahbeh (1824-29).

PRAM, or **PRAAM** (Fr. *prame*, Dutch *praam*, Ger. *Prahm*, *Prahme*, from OChurch Slav. *pranŭ*, Pol. *prom*, ferry; ultimately connected with Skt. *par*, to cross, Eng. *fare*). A large flat-bottomed boat or lighter used in the Continental ports of the North Sea and Baltic for loading and unloading merchant ships. It is frequently decked over or roofed over. As late as the early part of the nineteenth century prams were used as armed gunboats for the defense of the smaller ports.

PRANG, LOUIS (1824-). A German-American engraver, lithographer, and publisher. He was born in Breslau, Germany; participated in the Revolutionary movement of 1848; emigrated to the United States in 1850, and settled in Boston, where he became successively a wood engraver (1851), a lithographer (1856), and a publisher (1861), and originated the Prang method of art instruction, publishing the books and material needed for the carrying out of that method. He also became president of the Prang Educational Company, of Boston, and of the Taber-Prang Art Company, of Springfield, Mass. He wrote *The Prang Standard of Color* (1898).

PRASE (Fr. *prase*, leek-green, from Gk. *πράσον* *prason*, leek). A transparent, crystallized, or crypto-crystalline variety of quartz, varying in color from a dull leek to deep green. It is sometimes cut as a gem. Specimens of prase are found on Staten Island, N. Y., and at various other localities in the United States, none of which, however, are of a quality suitable for gems.

PRASLIN, *prá'lán'*, EUGÈNE ANTOINE HORACE, Comte de Choiseul. See CHOISEUL-PRASLIN.

PRATER, *prät'ēr*, THE. The principal park of Vienna (q.v.).

PRATI, *prät'é*, GIOVANNI (1815-84). An Italian poet, born at Dasindo. He studied law at Padua, but gave more attention to poetry than to jurisprudence. His first notable poem was the *Edmenegarda* (1841), a work which shows him under the influence of Romanticism. Going to Milan, he there published the *Canti lirici*, the *Canti pel popolo*, and the *Ballate*, all of which reflect his civic feelings as well as his adherence to the romantic doctrines. At Turin in 1844 he put forth the *Memorie e lacrime* and the *Nuovi canti*. On account of his *Albertismo*, glorifying Charles Albert, he was expelled from Tuscany by order of Guerrazzi, who was then in power, and took refuge in Piedmont. With the change of capital he passed from Turin to Florence and thence to Rome, becoming Counselor of Public Instruction and Senator in 1876. He died at Rome, May 9, 1884. To this latter period of his life belong two collections of verse, the *Psiche* (1875), and the *Iside* (1878), which contains his best lyrics of this time. Consult his *Opere varie* (5 vols., 1875); De Gubernatis, *Ricordi biografici* (Florence, 1873).

PRATINAS (Lat., from *Πρατίνος*). A Greek poet, born in Philus, in the Peloponnesus, who lived in Athens about B.C. 500. According to Suidas, he was a contemporary and rival of Æschylus, and was the first to introduce the satyric drama into Athens. He also wrote tragedies, lyrics, and *hyporchemata*, of which a considerable

and interesting fragment has been preserved by Athenæus (xiv., 617). For the fragments of his lyrics, consult Bergk's *Poetæ Lyrici Græci* (Leipzig, 1843).

PRATO, *prät'ò*, or PRATO IN TOSCANA. A city in the Province of Florence, Italy, situated on the Bisenzio, 11 miles northwest of Florence (Map: Italy, F 4). The city is well built, surrounded by walls, and protected by a citadel. The cathedral, partly Tuscan-Romanesque and partly Gothic, was completed in the fourteenth century. The interior is beautifully decorated with paintings, frescoes and reliefs. The Madonna delle Carceri is a church in the Renaissance style of the fifteenth century. There are several other churches, a town hall with a picture gallery, a music academy, and a library of 25,000 volumes. The city has a gymnasium, a lyceum, and a technical school. The industries are straw-plaiting, and manufactures of woolen and cotton goods, silk thread, biscuits, hats, and machinery. There are also iron and copper works, and productive serpentine quarries. Population (commune), in 1881, 42,190; in 1901, 51,453. Prato was an independent city before it became subject to Florence in the fourteenth century.

PRÄTORIUS, *prä-tò're-us*, MICHAEL (1571-1621). A German composer and writer, born at Kreuzberg. He occupied the position of kapellmeister at Lüneburg, and later was kapellmeister, organist, and secretary to the Duke of Brunswick. With the exception of these facts nothing is known of his life. Among his compositions are: *Musa Sionia*, collection of 1244 vocal numbers in nine parts: *Eulogia Sionia* (1611); 60 motets; *Missodia Sionia* (1611); *Terpsichore* (1612), which included dance pieces by Prätorius and some French composers; *Peuricinium* (1621); 14 church songs; and many anthems, songs, and contrapuntal pieces. His great work, *Syntagma Musicum*, consisting of three volumes. Vol. i. 1615, divided into two parts, is a descriptive and historical work in Latin on ancient and ecclesiastical music, and on ancient musical instruments. Vol. ii., written in German in 1620, is divided into five parts and an appendix. This is beyond question the most valuable extant treatise on contemporary musical instruments, especially the organ. The appendix is devoted to woodcuts of the principal instruments described. Vol. iii. treats in an interesting manner of contemporary secular composition, solmization, and notation. Prätorius was a skillful composer, but is of more value to the musical historian for his erudite treatises. He died at Wolfenbüttel.

PRATT, CHARLES. See CAMDEN, first Earl of.

PRATT, CHARLES (1830-91). An American merchant and philanthropist, born at Watertown, Mass. He removed to New York City in 1851 and began his business career in the oil and petroleum trades. In 1879 he became president of the Board of Trustees of the Adelphi Academy, in Brooklyn, and in 1887 he founded the Pratt Institute (q.v.), in Brooklyn.

PRATT, EXOCH (1808-96). An American philanthropist, born at North Middleborough, Mass. In 1831 he settled in Baltimore, Md., where he soon became prominent in the iron trade, as well as in financial circles. He founded the House of Reformation and Instruction for Colored Children at Cheltenham, Md., and the Mary-

land School for the Deaf and Dumb, at Frederick, and the Pratt Free Library, which he presented to the city of Baltimore and which was opened in 1886.

PRATT, ORSON (1811-81). A Mormon apostle, born at Hartford, N. Y. He received only a common school education, but in later life managed, despite great difficulties, to acquire considerable knowledge, particularly of mathematics. He joined the Mormon Church in 1830, and soon rose high in the organization, becoming one of the Council of Twelve in 1834 and one of the Twelve Apostles in 1835. He was accounted one of the most eloquent preachers in the Church, and made numerous missionary journeys to England and elsewhere. Because of his championship of his faith as a writer and speaker, he became known as the Paul of Mormonism. Pratt was many times a member of the Utah Assembly, and was several times its Speaker. From 1874 until his death he was Church historian and Church recorder. He was also professor of mathematics in the University of Deseret. He discovered in 1854 the "law of planetary rotation," and wrote a number of books on mathematical subjects. His published works include: *Divine Authenticity of the Book of Mormon* (1849); *Great First Cause* (1851); *Cubic and Biquadratic Equations* (1866); *Bible and Polygamy* (1870); *Key to the Universe* (1866).

PRATT, PARLEY PARKER (1807-57). A Mormon apostle, called the Isaiah of his people, brother of Orson Pratt. He was born in Burlington, N. Y., joined the Mormons in 1830, and five years afterwards had risen to the dignity of one of the Twelve Apostles. He worked as a missionary in the East and Middle West; in 1840 was sent to England and at Manchester established the *Millennial Star*; and on his return to America accompanied the party which first visited the valley of the Great Salt Lake, in which Parley's Peak and Parley's Cañon were named for him. After missionary work on the Pacific Coast he set out for the East, but was murdered near Van Buren, Ark. His works include: *Voice of Warning* (1837); *History of the Persecutions in Missouri* (1839); and *Key to the Science of Theology* (1854).

PRATT, SAMUEL JACKSON (1749-1814). An English writer, better known in his day as COURTNEY MELMOTH. His father was a brewer of Saint Ives in Huntingdonshire. The son was ordained in the English Church, but he soon abandoned the pulpit for the stage. For several years he performed with little success in London, the provinces, and Ireland. Pratt published an immense number of books, some of which went through several editions and were translated into French. They comprise verse, travel, criticism, biography, and the drama.

PRATT, SILAS GAMALIEL (1846—). An American composer, born in Addison, Vt. His musical education was obtained under native teachers, until he was 22 years old, when he went to Berlin for advanced work under Bendel and Kullak, and, on a subsequent visit, with Dorn (in score-reading). He organized the Apollo Club of Chicago in 1871. His opera *Zenobia* was given in 1882. In 1890 he was appointed professor of piano in the New York Metropolitan Conservatory. He published a lyric opera, *Lucille* (1887), several symphonies, sym-

phonic suites, songs, and part-songs, many of which have been very successful.

PRATT INSTITUTE. A coeducational school for manual and industrial training, in Brooklyn, N. Y., established in 1887 by Charles Pratt. Besides the high school, which provides a general education, the Institute comprises normal, technical, and trade departments, with a total attendance, in 1902, allowing for duplications, of 3183 (2100 being women), distributed as follows: High school, 262; fine arts, 927; domestic arts, 757; domestic science, 250; science and technology, 611; kindergarden, 166; library, 38; gymnasium, 524. The department of domestic art is especially known for its excellent courses in cooking and sewing. A banking institution, known as the Thrift, is maintained for saving and investment by the students. The Institute conducts both day and evening classes, and as it has a liberal endowment, amounting in 1902 to \$2,383,926, it makes merely nominal charges for tuition. The buildings, which are seven in number, well-equipped with excellent laboratories and museums, were valued in 1902 at \$1,179,473, and the income was \$144,093. The library contains 76,000 volumes. The management is in the hands of a board of five trustees under the presidency of Charles M. Pratt.

PRATZ, PRÄTS, LE PAGE DU (?-1775). A French explorer in America. He was born in the Low Countries, served in the French army, and, about 1718, having acquired an interest in the French Compagnie d'Occident, went to New Orleans. His attempts to found a colony were unsuccessful, but he explored the basins of the Missouri and Arkansas, spending eight years inland. Du Pratz returned to France in 1734. He published *Histoire de la Louisiane* (1758), a work of considerable historic value.

PRAWN (formerly also *praun*, *prane*, probably from Lat. *perna*, sea-mussel, ham). A shrimp-like crustacean of the family Palæmonidae, remarkable for a long serrated beak projecting from the carapace. Many of them are semi-transparent, and exhibit very fine colors; they are also very active creatures, and most interesting inmates of an aquarium, but are excessively voracious, and apt to make great havoc among its other inhabitants. The common European prawn (*Palæmon serratus*) attains a length of three or four inches. It is even more esteemed for the table than the shrimp. Several species of edible prawns occur on the coasts of the United States, but the best known and most abundant of these is *Palæmonetes vulgaris*, which is found among the eel-grass in shallow water from Massachusetts to South Carolina.

PRAXÆAS. A Unitarian schismatic of the end of the second century. He was born in Asia Minor; became an ardent Patripassionist, and an upholder of other anti-trinitarian views; and preached this heresy at Rome, and then in Carthage where Tertullian opposed him in defence of Montanism. Tertullian's attack on Praxeas's monarchism, *Adversus Praxæam* (between 206 and 210), is our only source for his life.

PRAXITÆLES (Lat., from Gk. Πραξιτέλης). A celebrated sculptor of ancient Greece, of whose life little certain is known, except that he was a citizen of Athens, and lived in the fourth century B.C. Pliny gives Olympiad 104 (B.C. 364-361) as his date, and Vitruvius says he worked on the

Mausoleum at Halicarnassus, about B.C. 353. The former date seems connected with the battle of Mantinea, and the activity of Praxiteles, Cephisodotus (q.v.), perhaps an elder brother, and other Athenian artists at this period in the Peloponnesus. There is nothing in the statements about Praxiteles that indicates artistic activity after B.C. 330. His most famous works have perished, and are known to us, if at all, only through Roman copies. The most famous was the Aphrodite of Knidos, which Pliny calls the finest statue in the world. In it the goddess was represented as having just laid aside her clothing to enter the bath; she was naked, but, while conscious of her beauty, showed plainly her reluctance at displaying it even to herself. The only good complete copy is a statue in the Vatican, which has been disfigured for a hundred years or more by a mass of tin drapery about the lower limbs. The best head is in private possession in Berlin. The statue shows how the ideals of the fifth-century art had been modified. The gods and goddesses of this period have lost the superhuman element, and are little more than idealized men and women. Praxiteles himself seems to have avoided the sensuous and weak, but his copyists and imitators were not so fortunate. Another famous statue was the Eros of Thespia, dedicated by the hetera Phryne, the mistress of Praxiteles and the most famous beauty of her time, who was said to have served as a model for the Aphrodite. This statue is by some thought to be the original of the Eros of Centocelli in the Vatican, though this is doubtful. The artist was celebrated for his satyrs, and two very frequent types may with probability be referred to his originals. One is the youthful satyr who pours wine from a pitcher in his raised right hand into a bowl in his left, well represented by the Palermo copy; the other is the resting satyr, best known from the Capitoline statue immortalized by Hawthorne in his "Marble Faun." Another work is one reproduced in the statues which represent the youthful Apollo playfully threatening with an arrow a lizard crawling toward him on a tree-trunk, which must be Praxiteles's Apollo Sauroctonos, or Lizard Slayer. More fortunate than other artists of antiquity, Praxiteles is known to us by one undoubted original, the Hermes of Olympia, which was found May 8, 1877, during the excavation of the Heræum, where it was seen by the traveler Pausanias. The youthful god is here represented as the protector of his baby brother Dionysus. He rests his left elbow on a tree-trunk, over which his cloak is hung, while on the lower arm sits the baby stretching one hand toward some object (probably a bunch of grapes held in the extended right hand of the god). The attitude is easy and the pose graceful, giving opportunity for a variety of contrasting curves, while the technical execution is beyond praise. But the chief beauty of the work is in the wonderful head, which is strong and thoughtful yet full of sensitiveness and delicacy. The lines are finely curved, and in the modeling every part receives equal attention, so that the effect is produced by an infinite number of details, without giving undue prominence to any part, thus contrasting somewhat strongly with the methods of Scopas (q.v.). Another work which makes strong claim to being an original of this artist, and is almost certainly executed from his drawings, is the Basis from Mantinea, where on three slabs is reproduced the

strife of Apollo and Marsyas in presence of the Muses. The figures are in low relief, and full of grace, though without the perfection which characterizes the Hermes. A fine marble bust found at Eleusis is also regarded by many competent judges as the original of a Eubuleus by Praxiteles. It certainly shows strong resemblance to the Satyr and other works of this artist, but the identification cannot be regarded as certain. In addition to the histories of Greek art (q.v.), consult: Furtwängler, *Masterpieces of Greek Sculpture*, trans. by E. Sellers (London and New York, 1895), Klein, *Praxiteles* (Leipzig, 1898), both to be used with caution; Kekulé, *Der Kopf des Praxitelischen Hermes* (Stuttgart, 1881); Amelung, *Die Basis des Praxiteles aus Mantinea* (Munich, 1895).

PRAY, GEORG (1723-1801). An Hungarian scholar and historian, born at Neuhausel. In 1741 he entered the Jesuit Order, subsequently was an instructor in various educational institutions, including the Theresianum at Vienna and academies at Tyrnau and Buda, and was permitted by his superiors to transfer his activities to historical research. Upon the suppression of the Jesuits by Clement XIV. he was appointed royal historiographer of Hungary, and in 1777 custodian of the library of the University of Buda (removed in 1784 to Pesth). He also received otherwise from the Crown assistance and distinctions. He is to be ranked with Stephen Katona (1732-1811), also a Jesuit, as a founder of scientific Hungarian history. His publications, strongly patriotic in tone, include *Annales Veteres Hunnorum, Avarorum et Hungarorum* (1761), *Annales Regum Hungariæ* (1764-70), and *Specimen Hierarchæ Hungariæ* (1776-79).

PRAY, ISAAC CLARK (1813-69). An American journalist, playwright, and actor. He was born in Boston and graduated at Amherst College in 1833. He began newspaper work in his native city, but shortly afterwards produced in New York his plays of *Giulietta Gordon* and *The Old Clock*, the latter based on a story of his own. In England, in 1846, he appeared as an actor in *Hamlet* and *Othello*. In 1850 he became dramatic critic for the New York *Herald*, and later for a time he edited the Philadelphia *Inquirer*. He also engaged successfully in theatrical management, besides being the author of *Virginus* and other plays. Among his works are *Prose and Verse* (1836), *Poems* (1837), *Book of the Drama* (1851), and *Memoirs of James Gordon Bennett* (1855).

PRAYER (OF. *priere*, Fr. *prière*, from ML. *precaria*, prayer, from Lat. *precar*, to entreat; connected with OChurch Slav. *prositi*, Skt. *prach*, to ask, Goth. *frah*, I asked, OHG. *frāgen*, Ger. *fragen*, AS. *frigan*, prov. Eng. *frain*, to ask). In its broadest sense, a verbal address made to a spiritual being. Such a communication usually embodies a petition, but may also contain confession, apology, thanksgiving, tidings, explanation, or meditation. From the point of view of comparative religion the main characteristics of prayer may be arranged under several heads. (1) *Universality*.—It would seem that the act of prayer must be as general as belief in spirits, that is to say common to humanity, but this view has been contested. Lubbock maintained that lower forms of religion are almost independent of prayer, which, in his opinion, involves a belief

in the divine goodness. He cited statements made by Park and Livingstone in relation to Africans, who were not inclined to offer petition to the deity, considering him too exalted to listen to human appeals. Other travelers have given similar reports concerning Bushmen, Eskimo, and other tribes. The African observers, however, seem to have had in mind habitual worship of a nature similar to that practiced by Christians and Mohammedans; at any rate, later writers have given abundant testimony to the frequency of prayer in heathen Africa. As to the greater deities, it is frequently held that they are inaccessible to ordinary persons, but should be addressed through the medium of an intercessor. Minor gods, on the other hand, are open to appeal from any quarter. Prayer is offered also to the departed souls of the family, who are supposed to exercise a sort of guardianship over their kindred. In all lands, probably, hunters and fishermen entreat the particular patron of their craft, or the spirit which resides in the fetish they carry. Thus, African boatmen, while crossing a river, offer prayer to a crocodile as a divine being. In Australia also it is said that any person whosever may approach the abode of a spirit, to whom is addressed information and advice, on which the latter is expected to act. From such testimonies it may be inferred that prayer, in a wide sense, is universal, and that supposition of its absence has arisen from prejudice, misunderstanding, or limitation of the practice to one familiar type. (2) *Ethical Character.*—The view is frequently maintained that in lower stages of culture prayer is quite unethical, and that only at higher levels does it encourage virtue and restrict vice. It is indeed true that prayers of savages are usually direct and simple requests for temporal blessings, and it is thought to be only in early civilizations that we begin to find repentance for sins committed. Yet it may be doubted whether the beginnings of ethical prayer are not to be found in a much earlier social state. It is at any rate certain that petitions of barbarians are by no means prompted simply by selfish considerations, but, on the contrary, that these also are inspired by affection, sentiment, and sense of natural and spiritual beauty. Among American Indians, for instance, ceremonial prayers are full of poetry, feeling for nature, and desire for communion with the gods. (3) *Imprecation.*—As prayer is employed in order to obtain benefits for the pleader, so by a natural antithesis it is used to injure enemies, on whom it invokes the divine anger. This function of cursing is as ancient and universal as that of blessing. It is the regular business of shamans and medicine men to bring disaster on foes, cause their injury and death, blight their crops, and destroy their armies. In the same manner prayer is employed to undo the evil spirits, as in old Babylonian exorcistic formulas. (4) *Formalism.*—In parts of Africa prayers addressed to the gods are not in any stereotyped form, but worshipers ask for what they desire in natural language, with a certain amount of added adulation, just as they might prefer a petition to a chief. Here prayer has not reached that stage of development in which it is always offered in certain formulas, which, becoming traditional, are after a time believed to possess some peculiar efficacy of themselves, and to be as it were incantations or charms. Yet it is likely that even in the most

savage religions this process has already begun, and that prescribed or traditional prayers are everywhere to be found. (5) *Posture.*—The attitude and gesture of prayer are conventional, and have greatly varied. The principles seem to be two: first, the closest possible contact with the being addressed; secondly, the adoption of such position as is considered to belong to a suppliant. The belief that the divine being resides in the firmament, widely spread in all periods and conditions of culture, often causes the worshiper to raise eyes and hands toward heaven. This practice was common in ancient Greece; but the posture was affected by circumstances. In supplication at the altar, the hands might be made to touch the sacred relics or images; if the appeal was made to the powers below, the hands might be placed on the earth; the suppliant might embrace the knees of the statue, in the prescribed attitude of entreaty. The Roman veiled his head, either as a symbol of concentration, or for the purpose of shutting out ill-omened sights and sounds; he might bow the body or prostrate himself. Lifted hands, prostration, or kneeling, and covered head were also the attitude of prayer among the Jews. A common mediæval position was kneeling with palms joined and hands extended; the folding of hands seems to have been of more recent adoption.

In the Christian sense, prayer is any voluntary expression of communion with God, whether formal or informal, brief or prolonged, individual or collective. Adoration, thanksgiving, confession, intercession, are all joined with petition in Christian prayer. It is fundamental that the praying Christian must be perfectly submitted to the will of God and desirous of finding more completely what is its application to his own conduct and affairs. His petitions may then embrace the supply of all his wants, physical and spiritual; and he may be sure that he will be heard and answered as God's infinite wisdom shall see best for him and all concerned in his welfare.

Prayer being regarded by Christians as an ordinance of God, it follows that they must seek to be guided in prayer by the rules of His revealed will, in so far as His will has been revealed. It is therefore held by Christians in general, in accordance with their doctrine of the atonement (q.v.) and of the intercession of Jesus Christ (see INTERCESSION, DOCTRINE OF), that the only true way of access to God is through the mediation of Jesus Christ, and that prayer must be made in the exercise of faith in Him, the worshiper taking his stand upon the ground of the obedience or "finished work and accepted sacrifice" of Christ, and looking up to Christ as now interceding in heaven. It is also held, in accordance with the doctrine of man's corruption, that prayer can be truly made, in faith, and for things agreeable to God's will, only by the help of the Holy Spirit.

The best discussions of prayer from the Christian standpoint will be found in the treatises on systematic theology and apologetics. The following works may also be consulted: Bickersteth, *A Treatise on Prayer* (18th ed., London, 1853); Liddon, *Some Elements of Religion* (London, 1873); Clarke, *The Christian Doctrine of Prayer* (Boston, 1874); Monrad, *The World of Prayer* (Eng. trans., Edinburgh, 1879). For modern objections to prayer, consult: Tyndall, *On*

Prayer (New York, 1874); Romanes, *Christian Prayer and General Law* (London, 1874).

PRAYER, WEEK OF. A season marked by special devotional meetings among Christians of many denominations throughout the world at the beginning of each new year. It originated in the Presbyterian mission of Lodiana, India, in 1858. Reports of the remarkable religious awakening in the United States the year before having reached India (see REVIVALS, RELIGIOUS), the members of this mission, at their annual meeting in November, issued an invitation for a universal concert of prayer, to be held yearly, beginning with the first week in January, 1860. The request met with a hearty response, and the week of prayer has been regularly observed ever since.

PRAYER-BOOK, COMMON. The name commonly given to the service-books used in public worship by the churches of the Anglican communion, designated on the title page as "The Book of Common Prayer, and Administration of the Sacraments, and other Rites and Ceremonies of the Church." As the only official liturgical book of these churches, it thus contains in small compass all that was left by the reformers of what in the Roman Catholic Church is spread out into the missal, breviary, pontifical, and ritual. The purpose of the compilers was explicitly, in addition to substituting English for Latin and removing all that they considered 'superstitious or ungodly' in the pre-Reformation books, to simplify and abridge the service so that the laity might take an intelligent part in it. The process began in the reign of Henry VIII., but the earliest complete book was that published in 1549, and known as the first prayer-book of Edward VI. It was drawn up with great prudence, altering as little as possible what had been familiar to the people. This book was compiled by Cranmer and Ridley, assisted by eleven other divines, and revised by Convocation. The matins, lauds, and prime of the breviary were combined into the "order for morning prayer," while the evening prayer was made up from vespers and compline. The communion service was largely based on the old English missals, especially that of Salisbury, which had been the one most used. The ordination services were added in 1550.

The influence of the more radical and especially the Continental reformers (such as Bucer and Peter Martyr) was exerted in favor of a more thorough-going change, and a revised book, the second prayer-book of Edward VI., appeared in 1552, marking the furthest point of departure from the older ways. Many of the ancient ceremonies which had been retained in the first book were now omitted; the surplice for priests and deacons, and the rochet for bishops, were prescribed as the authorized vestments, whereas it is to the standard of the first book that the ritualistic party in modern times appeals for sanction (see ORNAMENTS RUBRIC, THE); prayers for the dead were omitted, and the formula used in the communion of the people was made to satisfy a Virtualist or even a Zwinglian view of the sacrament. (See LORD'S SUPPER.) In 1559, however, under Elizabeth, who had little sympathy with the extreme and aggressive reformers, such changes as were made were in the nature of a return to the first book; and some further

changes made by James I. in 1604, after the Hampton Court Conference, had a not dissimilar bearing. After the use of the prayer-book had been absolutely prohibited by law under the Commonwealth, and restored with the monarchy, the question of revision came up once more, and was discussed in the lengthy sittings of the Savoy Conference; but such changes as were made in 1662, when the English book practically assumed its final form, were not of a nature to conciliate the defeated Puritans. An attempt to reopen the matter with this end in view was made in 1689, after the Revolution, but nothing came of it except the report of a commission. In Scotland the Episcopal Church uses the English book, with the exception of a permissive use, under certain circumstances, of a different communion office, based upon Laud's proposed book for Scotland. The disestablished Church of Ireland made a thorough revision in 1878, in a more strongly Protestant sense than any other of the current books.

The history of the American Book of Common Prayer has distinct and interesting features of its own. When the separate Episcopal Church in the United States was organized, a book was compiled in 1783, now known as 'the Proposed Book,' which had only a qualified and informal acceptance. The changes of this book were too sweeping to commend themselves to the temper of that day, though several important ones were adopted at the recent revision. The book actually adopted by the General Convention of 1789 disclaims in its preface the intention of departing from the Church of England in any essential point of doctrine, discipline, or worship. Its variations, accordingly, are chiefly those required by local circumstances or made for the purpose of removing archaisms in the language, though more serious things were either done or contemplated, as in the omission of the Athanasian Creed. The influence of the Scottish bishops from whom Seabury obtained his consecration was felt in the restoration, following their own use, of the invocation of the Holy Ghost in the central prayer of the eucharistic office, after primitive models. In the middle of the nineteenth century the far-seeing Dr. Muhlenberg made a plea for liturgical flexibility and enrichment, which was taken up thirty years later and carried to a successful conclusion in regard to both of these advantages. Minute, careful, and deliberate processes of revision, lasting over nine years, resulted in the publication in 1892 of a prayer-book which probably will remain materially unchanged for many a year. While both flexibility of use and enrichment by the addition of liturgical forms were sought, a return to a nearer approach to conformity with the English book was a natural outcome of the increasingly close and friendly relations between the mother and daughter churches. Consult: Maskell, *The Ancient Liturgy of the Church of England* (3d ed., London, 1882); Blunt, *Annotated Book of Common Prayer* (ib., 1892); Procter, *History of the Book of Common Prayer* (ib., 1855); Luecock, *Studies in the History of the Book of Common Prayer* (ib., 1881); Gasquet and Bishop, *Edward VI. and the Book of Common Prayer* (ib., 1890); Barry, *Teacher's Prayer-Book* (ib., 1884); Huntington, *Short History of the Book of Common Prayer* (New York, 1893), specially full on the American revisions; Dix,

Lectures on the First Prayer-Book of Edward VI. (ib., 1881).

PRAYER FOR THE DEAD. The practice which prevails in the Roman Catholic, Greek, and other Oriental churches of praying for the souls of the deceased with the intention and expectation of obtaining for them an alleviation of their sufferings after death, because of venial sins, or of the penalty of mortal sins, remitted but not fully atoned for during life. The doctrine of purgatory, or a middle state of purgation after death before the soul can enter heaven, naturally gives rise to the practice of prayer for the dead, though there are those who pray for the dead, yet do not explicitly accept the doctrine of purgatory. The two doctrines are, however, closely connected, especially in conjunction with the related doctrine of the communion of saints. (See SAINTS.) A belief in the efficacy of prayer for the dead existed in practically all of the ancient religions, especially those of Egypt, India, and China. The existence of this belief, implicit, if not explicit, affords the only rational explanation of many of the practices of the Greeks and Latins with regard to their dead. Among the Jews the custom of prayer for the dead is attested by the well-known text in II. Maccabees xii. 44, 45, that it is "a holy and wholesome thought to pray for the dead that they may be loosed from their sins." The practice of prayer for the dead is equally recognizable in the early Christian Church. The parable of Lazarus and the rich man evidently portrays a definite belief in the inter-communion of this earth with the world beyond the grave. The Fathers of the first centuries, Clement of Alexandria, Tertullian, Saint Cyprian, and especially Saint John Chrysostom, Saint Cyril of Jerusalem, and Saint Augustine, frequently allude to prayers for the dead. The Liturgies of all the rites without exception contain such prayers. Prayer for the dead has been a constant tradition of the Roman Catholic and Eastern churches. The Protestant churches, with some exceptions, have repudiated the practice. Prayers for the dead were not forbidden in the English Church, and there is an almost unbroken tradition of ecclesiastical authorities, including such names as Andrewes, Barrow, Ken, Wesley, and Keble, who approved of it. Consult: Luckock, *After Death* (ib., 1879); Plumtree, *The Spirits in Prison* (ib., 1884); Mumford, *Two Ancient Treatises on Purgatory* (New York, 1894).

PRAYING INSECT, or MANTIS. See MANTIS.

PREACHING FRIARS. See DOMINICANS.

PRE-ADAMITES. Supposed inhabitants of the earth anterior to Adam. The term is applied particularly to a theory advanced by Isaac de la Peyrère (better known by his Latinized name *Pererius*), which he attempted to prove from the Bible. Peyrère was born of a Calvinist family of Bordeaux in 1594, and was attached to the service of the Prince of Condé. His theory was first made public in Paris in 1655, in the form of a commentary on Romans v. 12-14 entitled *Præadamitæ*. The same year he published the first part of a formal treatise on the pre-Adamite hypothesis, and the theological consequences to be derived therefrom, entitled *Systema Theologicum ex Præadamitarum Hypothesi*. According to his hypothesis Adam was the progen-

itor of the Jewish race only, and it is only of him and his race that the Bible is designed to supply the history. Other races existed on earth before that of Adam; but of them the Bible contains no record, nor did the Mosaic law regard them or impose any obligation upon them. It was only under the gospel that they began to be comprehended in the law, which through Christ was given to all the human races of the earth; and it is in this sense that sin is said (Rom. v. 13) to "have been in the world until the law," but not to have been "imputed when the law was not." For the pre-Adamite race, as the law was not, there was no *legal* offense. The only evil which Peyrère recognized was natural evil. The same limited interpretation he extended to most other details of the Mosaic history. Thus he regarded the deluge as partial, being confined only to the Adamite race. Other miraculous narratives of the Pentateuch and even of other books he restricted similarly.

As his book was published in the Low Countries, he fell under the animadversion of the Inquisition, and eventually was arrested in the diocese of Mechlin, but was released at the instance of the Prince de Condé. He afterwards went to Rome, where he conformed to the Roman Catholic Church, and made a full retraction of his erroneous opinions (*Epistola ad Philotimum*, Rome, 1657). He was offered preferment by the Pope, Alexander VII., but returned in preference to Paris, where he entered the Seminary of Notre Dame des Vertus, in which he resided till his death in 1676. For a modern discussion of this theme, consult Winchell, *Preadamites* (Boston, 1880).

PRÉAULT, præ'ò, AUGUSTE (1809-79). A French sculptor, born in Paris. He was a pupil of David d'Angers and an ardent admirer of the Romantic School. For fifteen years both Salons were closed against his sculpture, because of his defense of these principles. His works include "Clemence Isaure," "Jacques Cœur," "Ophelia," a bronze bas relief, and several statues and funeral monuments in the Paris churches and cemeteries.

PRÉ AUX CLERCS, præ ó klärk, LE. A large plain once extending to the gates of Paris, northeast of the Abbey of Saint Germain des Prés, on the left bank of the Seine, so called because in the Middle Ages it was a resort of the students of the university. The part owned by the abbey attracted students by being nearer, and riots with the monks resulted in legislation by which it was ceded to the university in 1368. Later it was a resort of fashion and duellists. It is now covered by the Faubourg Saint Germain.

PREB'END (ML. *præbenda*, prebend, allowance of food and drink, fem. sg. or neu. pl. of Lat. *præbendus*, gerundive of *præbere*, *præhibere*, to offer, from *præ*, before + *habere*, to have). Originally, a portion of food, clothing, or money allowed to a monk or other cleric out of the revenues of a cathedral or collegiate church. After the organization of chapters of canons for the maintenance of the daily services in the Bishop's church, endowments came to be made for their support, the canons usually living in common. When, about the eleventh century, canons ceased to live in common, each received a share of the revenues of the cathedral, called a prebend. At the present time in the Church of England all

prebendaries in residence are by law styled canons, but the holders of disendowed prebendal stalls are still known as prebendaries.

PREBLE, prēb'l, EDWARD (1761-1807). An American naval officer. He was born in Portland, Me., ran away from home in 1777, joined a privateer, and soon afterwards entered the Massachusetts marine as a midshipman on board the *Protector*. In 1779 he was captured and imprisoned on the prison-ship *Jersey* in New York harbor; but was soon released, and until the close of the war served on the *Winthrop*. While attached to this vessel, he boarded with only 14 men a British brig in Penobscot harbor, Maine, and took her out in the face of a battery. When the United States Navy was organized, in 1798, he was one of the first to be commissioned as lieutenant, and in 1799 was promoted to the rank of captain. In the same year, while in command of the *Essex*, he convoyed from Batavia a fleet of merchant vessels. In May, 1803, he was put in command of the squadron fitted out against the Barbary Powers. Arriving off Tangiers in October, he forced the Sultan of Morocco to renew the treaty of 1786 (see BARBARY POWERS, WARS WITH THE), and then cruised for some time in the vicinity of Tripoli, which port he kept closely blockaded for several months. On July 25, 1804, his fleet then consisting of a frigate, three brigs, three schooners, two bomb-vessels, and six gun-boats, he attacked the defenses of Tripoli and the Tripolitan fleet with great vigor, captured three gun-boats, and sank three more. In five subsequent attacks on August 3d, August 7th, August 24th, August 29th, and September 3d, he inflicted considerable damage with small loss to himself, but on September 10th was superseded in his command by Commodore Samuel Barron, who soon concluded a satisfactory treaty of peace with the Pasha. Returning to the United States, Preble received a medal and a vote of thanks from Congress, and in 1806 was urged by President Jefferson to enter the Cabinet as Secretary of the Navy, but declined on account of failing health, and in 1807 died of consumption at Portland.

PREBLE, GEORGE HENRY (1816-85). An American naval officer, born at Portland, Me. He entered the United States Navy as a midshipman in 1835, and during the war with Mexico participated in the operations along the Gulf coast of that country. In 1853 he was assigned to the *Macedonian*, one of the fleet with which Commodore Matthew C. Perry made his visit to Japan, and while in the Far East he was sent on an expedition to punish the Chinese pirates. During the early part of 1862 he commanded the gun-boat *Katahdin* and participated in Farragut's operations against New Orleans. He was promoted to the rank of commander in July, 1862, and while he was commanding the *Oucida* off Mobile his blockade was broken by the Confederate cruiser *Oreto* or *Florida*. For this he was dismissed from the service until it was learned that the *Florida* owed her escape solely to her superior speed. Preble was then reinstated. He commanded the *Saint Louis* in European waters during the greater part of 1863 and 1864, was then ordered home, and was placed in command of the fleet brigade which coöperated with General Sherman's army. He was chief of staff of the North Pacific Squadron in 1868-70, commandant of the

Philadelphia navy yard in 1873-75, and commanding officer of the South Pacific Station in 1877-78. In 1876 he was promoted to the rank of rear-admiral, and two years later retired from the service. In the latter part of his life he devoted considerable attention to historical subjects, contributed frequently to the *New England Historical and Genealogical Register* and to the *United Service Magazine*, and published: *A History of the Flag of the United States of America and of the Naval and Yacht Club Signals, Seals, and Arms, and the Principal National Songs of the United States* (1880); and *A Chronological History of the Origin and Development of Steam Navigation* (1883).

PRE-CAMBRIAN FORMATIONS. A term usually applied to all formations which are older than those containing the Olenellus fauna of the Cambrian period. The reason for applying such a general name to this series of rocks is that the Pre-Cambrian strata are often so highly metamorphosed, and devoid of organic remains, that their stratigraphic relations are indistinct, and it is therefore impossible to assign them an exact position in the geologic scale.

The Pre-Cambrian rocks consist in general of: (1) A great series of more or less highly metamorphosed igneous and sedimentary strata, such as gneisses, schists, slates, quartzites, crystalline limestones, etc.; (2) igneous rocks but slightly altered; (3) recognizable sedimentary rocks, which in rare cases contain fossils. In addition to the intense metamorphism which some of these rocks have undergone, they are often interfolded and much broken by faults. The mere fact that rocks are highly metamorphosed, however, does not determine them to be of Pre-Cambrian age, for such changes have sometimes taken place in rocks of much later date, as in the Devonian and Carboniferous.

The length of time occupied by the Pre-Cambrian periods must always be largely a matter of speculation, but geologically it extended from the time of formation of a solid crust up to the beginning of the Cambrian. Judging from the variety of forms that are found developed in as early a period as the Cambrian, and the length of time that has been required to develop the present fauna and flora found on the earth, the length of Pre-Cambrian time must have undoubtedly been very great. The highly altered character of the Pre-Cambrian rocks has unfortunately obliterated many fossil remains that were buried in the sedimentary strata, and it is only in the younger members of the series that distinct fossils have been found. Such traces have been discovered at several localities, notably in Newfoundland, Canada, the Lake Superior district, the Grand Cañon of the Colorado, and in Great Britain. The Pre-Cambrian rocks are at the present time divided into a lower system—the Archæan and an upper system termed the Algonkian. The former is sometimes also termed the basement or fundamental complex, and consists of igneous and highly metamorphosed rocks, so altered that their original condition is a matter of great uncertainty. Under the Algonkian are included the younger Pre-Cambrian rocks, which can usually be identified as sedimentary, although igneous intrusions also took place in this period. An earlier classification grouped all the Pre-Cambrian rocks as Archæan, subdividing them into a lower series called the Laurentian.

and an upper series, the Huronian, which corresponds to the present Algonkian.

The Pre-Cambrian rocks are widely distributed and form a series of disconnected areas, some of them of considerable extent. Their exposure at the surface may be due to their having remained uncovered since early geologic times, or because the overlying sediments and other rocks of later date have been worn away. The more important Pre-Cambrian areas found in North America are the following: (1) Laurentian area of Canada, consisting of a basement complex or Archaean system known as the Ottawa gneiss, which grades up into the Grenville series of Algonkian age. (2) The Hastings district southwest of Ottawa. (3) The original Huronian area bordering the north channel of Lake Huron and extending west to Lake Superior. Both the Archaean and Algonkian are recognizable here, the latter being subdivided into an upper and lower Huronian. (4) Adirondaek area of eastern New York. (5) The Lake Superior region. Probably a greater amount of work has been done in this area than any other of Pre-Cambrian age and the stratigraphic details have been most carefully worked out. (6) Eastern United States; a belt extending from Maine through New Hampshire, Massachusetts, Connecticut, New York, New Jersey, Pennsylvania, Maryland, Georgia, North Carolina to Alabama, and consisting of a complex series of semi-crystalline and holocrystalline rocks. (7) Black Hills area. (8) Southeast Missouri area. (9) Central Texas. (10) Scattered areas in the Cordilleran region. Pre-Cambrian rocks are also known in Great Britain, Scandinavia, Central Europe, China, India, and Australasia.

The Pre-Cambrian rocks are rich in mineral deposits. Almost inexhaustible supplies of iron ore are found in the Lake Superior region, and important deposits of the same metal are known in New York and New Jersey. Many valuable quarries of building stone are located within the Pre-Cambrian areas, while the other economic minerals include graphite, garnet, apatite, talc, emery, feldspar, gold, copper, and nickel.

PRECEDENCE (ML. *præcedentia*, from Lat. *præcedere*, to go before, from *præ*, before + *cedere*, to go, yield; connected with *cadere*, Skt. *śad*, to fall). The order in which individuals are entitled to follow one another in a state procession or on other public occasions. In former days questions of this sort were considered of great importance; thus the memoirs of Saint-Simon are largely occupied with minute histories of acrid controversies on these points. In modern times, with the gradual diminution of court ceremonial, less interest attaches to them; but they are still minutely regulated in some countries, either by statute law, by royal letters patent, or by ancient usage. The order of precedence among different countries is in modern practice reduced, as in the signing of treaties by several powers, to the alphabetical order of their names. Precedence among the diplomatic representatives accredited to any government depends upon the date of the presentation of their credentials, ambassadors, however, ranking envoys and ministers plenipotentiary. Precedence involves the right to be presented, or to pass into a room, first; but in processions, especially those of ecclesiastical dignitaries, the persons of highest rank regularly come last.

In the United States the only positive precedence is that given by official position; and in the settling of uncertain questions arising under this system, there is no final authority, different administrations having acted in different ways. The position of foreign ambassadors, for example, is questionable. It has been claimed for them that as the personal representatives of sovereign powers, accredited to the Executive, they should come next to the President, and before the Vice-President, who is only, so to speak, an heir apparent. There has been no official settlement of the question. It is also contended by some that the Governors of sovereign States of the Union should precede the General of the Army and the Admiral of the Navy, who are officers subordinate to the Federal Executive. A question has also been raised as to the position to be assigned to a United States ambassador when on leave at home. He is the personal representative of the Federal Government, and it may be held that he should have higher rank than the General of the Army or Admiral of the Navy. Great uncertainty, however, has prevailed in the usage of Washington on similar points. The most generally accepted order of official precedence at the national capital is as follows:

The President; the Vice-President and President of the Senate; Ambassadors in their order; the Chief Justice of the United States; Senators; the Speaker of the House; Representatives in Congress; Associate Justices of the Supreme Court; the Secretary of State, members of the diplomatic corps other than ambassadors, and foreign members of international commissions; the Secretary of the Treasury; the Secretary of War; the Attorney-General; the Postmaster-General; the Secretary of the Navy; the Secretary of the Interior; the Secretary of Agriculture; the Secretary of Commerce and Labor; the General of the Army and the Admiral of the Navy; the Governors of States; the Chief Justice and Associates of the Court of Claims; Circuit

and District Judges of the United States; the Justices and Associates of Territories and District of Columbia; the Lieutenant-General and the Vice-Admiral; diplomatic representatives of the United States; major-generals, rear-admirals, and staff officers of equal rank; brigadier-generals and commodores; chiefs of quasi-independent civil bureaus; chiefs of departmental bureaus in the order of their chief officers. Colonels, captains of the navy, staff officers of equal rank, the Colonel of the Marine Corps; Consuls-General and consuls of foreign governments, according to date of exequatur, and the same of the United States, according to seniority of service; lieutenant-colonels and majors of the army, commanders and lieutenant-commanders of the navy, and staff-officers of equal rank; the Commissioners of the District of Columbia, Governors of Territories, Lieutenant-Governors, and other elective State officers in their accepted order at home; captains, first lieutenants and second lieutenants of the army, lieutenants, masters, and ensigns of the navy, and staff officers of equal rank; assistant secretaries of executive departments, secretaries of legations, secretaries of the Senate and House of Representatives; and the clerk of the Supreme Court.

For the full table of precedence in England, consult any peerage; for that of Germany, Stillfried, *Ceremonialbuch des preussischen Hofes* (Berlin, 1878); for the older Continental usage, Hellbach, *Handbuch des Rangrechts* (Ansbach, 1804).

PRECEDENT (from Lat. *præcedens*, pres. part. of *præcedere*, to go before). In a general sense, any act or determination which is taken as a guide to action under similar circumstances thereafter, as personal habits are precedents automatically followed, and social and legal customs are precedents which have, by long observance, acquired the sanction of moral or civil law.

In its technical legal sense the term precedent has come to be employed to designate (a) the settled practice of the bar and (b) the judicial determination of questions of law by the courts. The popular expression 'forms and precedents' points to the former use of the word, as in the forms of pleading and the forms employed in conveyancing, which have acquired commanding authority in the legal profession, and are implicitly followed by successive generations of lawyers, until changed by statutory authority, only because of a long continued exact observance.

Of a different character is the judicial precedent. This has intrinsic authority and exerts a more or less binding force from the hour of its promulgation. It is not, as is generally believed, peculiar to the common-law system of England and the United States, but is essential to the administration of every legal system. Indeed, it is involved in the very conception of law as a *rule* of conduct that the same acts shall produce the same legal consequences, that the same combination of circumstances, however often it may arise, shall invariably be dealt with in the same way.

In this respect, however, the difference between our system and that which obtains under the civil-law system is that we have given a narrower range and at the same time a more conclusive authority to precedent. The common law denies the effect of precedent to legal writ-

ings, with the exception of a few texts of great antiquity (as Littleton and Coke), as well as to the unofficial expressions of legal opinion by eminent lawyers and judges, restricting it to judicial opinions officially delivered: while, on the other hand, it regards such decisions as of binding force, and not, as under the civil law, of merely persuasive authority. See **DICTUM**; **LAW**; **CIVIL LAW**; **CONSTITUTIONAL LAW**; etc. Consult: Wambaugh, *The Study of Cases* (Boston, 1894); Blackstone, *Commentaries*.

PRECENTOR (Lat. *præcentor*, leader in music, from *præcincere*, to sing before, from *præ*, before + *cincere*, to sing). The official in a chapter, whether cathedral or collegiate, whose duty it was to lead the singing. He commenced the psalm or hymn which was taken up and repeated either by the celebrant or another of the body, or by the rest of the choir. In modern chapters, the precentor ranks next in dignity to the provost or dean. He generally has charge of training the choir, and of the selection of the music. Among the non-episcopal bodies the precentor is the person who starts and conducts the singing, and who generally stands in front of the pulpit, sometimes at one side of it.

PRECEPT (Lat. *præceptum*, rule, doctrine, maxim, precept, neu. sg. of *præceptus*, p.p. of *præcipere*, to instruct, admonish, take beforehand, from *præ*, before + *capere*, to take). In law, a command or mandate in writing, directed to a sheriff or other ministerial officer, and constituting his authority to do the act named therein. It is generally considered as synonymous with the word process.

In Scotch law, a 'precept of sasine' is an order of a superior to an agent or public officer, as a notary public, to give possession of lands to an under-tenant or vassal. A 'precept of *clare constat*' (literally, 'it is clearly established'), in Scotland, was a deed by which a superior acknowledged the right of an heir of a deceased vassal to succeed to the lands of his father. By statute this is no longer necessary.

PRECEPTORY (ML. *præceptorius*, relating to instruction, from Lat. *præceptor*, instructor, from *præcipere*, to instruct, admonish, take beforehand). The name given to certain houses of the Knights Templars, the superiors of which were called knights preceptors. All the preceptories of a province were subject to a provincial superior, called grand preceptor; and there were three of these who held rank above all the rest, the Grand Preceptors of Jerusalem, Tripolis, and Antioch. Other houses of the Order were called 'commanderies.' See **TEMPLARS**.

PRECESSION (ML. *præcessio*, advance, precedence, from Lat. *præcedere*, to go before). The points in which the equator intersects the ecliptic, called the equinoctial points, do not remain stationary, but retrograde slowly, i. e. move from east to west. This motion is called the precession of the equinoxes (q.v.). The word 'precession' is used because if on one day one of the equinoctial points arrive at the meridian of a place simultaneously with a fixed star, it will next day arrive at the meridian sooner than the star, or will *precede* it in transit. The amount of this movement is about 50" each year, and the equinoctial points will therefore require 25,800 years to make a complete circuit

in the heavens. This movement of the equinoxes also explains the want of coincidence between the signs of the zodiac and those of the ecliptic. See **ARIES**.

If the earth were truly spherical and homogeneous; or if it were composed of spherical layers each of uniform density; or, more generally, if it were such that the resultant of the gravitational attractions exerted on all its parts by any other body should always pass through a single definite point in its mass, its diurnal rotation would not be affected by the attractions of any other bodies. If originally rotating about a principal axis of inertia, it would forever revolve about it, and the direction of the axis would remain fixed in space. To put this in more popular language, the pole star (q.v.) would always be the same star. But, although the earth rotates about an axis almost exactly coinciding with its axis of figure, the attraction of various bodies, especially the sun and moon, on the oblate protuberant portion at the equator, tends to give it a rotation about an axis in the plane of the equator; and the combination of these two rotations gives rise to a shifting of the instantaneous axis of rotation in the earth and also in space. If this attracting force were constant, the pole of the equator would move about the pole of the ecliptic in a circle. But, owing to a disturbance called nutation (q.v.), produced by the unequal attraction of the moon, this motion is waved and not exactly circular. Thus the plane of the equator does not remain fixed, and consequently the points in which the equator intersects the ecliptic will also vary, and this causes the precession of the equinoxes. See **LUNAR THEORY**.

PRECHTL, prĕk't'l, JOHANN JOSEPH VON (1778-1854). An Austrian physicist, born in Bishofsheim and educated at Würzburg. He settled in Vienna in 1802 and in 1814 became director of the Institute of Technology there. He founded in 1809 the Naval Academy at Trieste. Prechtl wrote many articles for the *Technologische Encyclopädie* (1830-55), of which he was editor, and for the *Jahrbücher des Polytechnischen Instituts* (1819-39), which also was under his editorial charge; and published *Grundlehren der Chemie in technischer Beziehung* (2d ed. 1817), *Praktische Dioptrik* (1828), and *Untersuchungen über den Flug der Vögel* (1846).

PRÉCIEUSES RIDICULES, prä'syēs' ré'dé-ku'l', LES (Fr., the ridiculous blue-stockings). A brilliant comedy by Molière, first produced on November 18, 1659, in the Hôtel du Petit-Bourbon in Paris, and acted in 1660 before the King, who presented 3000 livres to the actors. The success of the play was instantaneous and owed little to its plot, but sprang from the general delight at Molière's scathing and brilliant satire of the *esprit précieux*, developed in the Hôtel de Rambouillet, and exhibited in its most exaggerated form by Mlle. de Seudéry and her school.

PRÉCIEUX, prä'syē' (Fr., finical, affected). An epithet applied to the affected style which developed in France during the seventeenth century. It was the outcome of a movement for purity and refinement in language, fostered in various Parisian salons, notably in that of the Hôtel de Rambouillet. It soon became itself a menace to the language, degenerating into a mere affectation of fine sentiment and fine words.

Under its influence, fantastic turns of speech replaced simple expressions to such a degree that the whole movement acquired a ridiculous character and led Molière to write his brilliant satire *Les Précieuses Ridicules*, which gave the death blow to the school. See **RAMBOUILLET**, **HÔTEL DE**.

PRECIOUS METALS. As the predominant use of the precious metals is for monetary purposes and radical changes in the quantity of the metals affect all prices, much interest attaches to their production. From the collapse of the Roman Empire to the discovery of America it is probable that no important additions were made to the world's monetary stock. With the discovery of America a new era came in, but it was not before the conquest of Mexico (1521) and of Peru (1533) that appreciable additions were made to the world's stock of silver and gold. The course of gold and silver production since 1493 is given in the following table:

AVERAGE ANNUAL PRODUCTION IN FINE OUNCES

	Gold	Silver
1493-1520.....	186,470	1,511,050
1521-1600.....	238,071	8,660,207
1601-1700.....	293,304	11,970,731
1701-1800.....	610,882	18,336,720
1801-1840.....	512,214	20,028,887
1841-1850.....	1,760,502	25,090,342
1851-1860.....	6,508,293	28,792,113
1861-1870.....	6,082,534	39,226,778
1871-1880.....	5,567,062	71,046,308
1881-1890.....	5,073,250	102,063,872
1891-1895.....	7,882,564	157,581,331
1896-1900.....	12,461,478	165,390,822
Total production		
1493-1850.....	152,779,050	4,817,930,012
1851-1900.....	334,031,609	4,026,051,467

See **GOLD**; **SILVER**.

PRECOCITY (from Lat. *præcox*, ripened too soon, from *præcoquere*, ripen beforehand, from *præ*, before + *coquere*, to cook; connected with Gk. *πέρνειν*, *peptein*, Skt. *pac*, to cook). A premature development, especially of the mental functions. The chief problems of precocity are (1) the relation between mental precocity and bodily abnormalities, (2) the relation between precocity and genius, (3) the course of training that the precocious child should receive. Experts disagree in their answers to the first two questions. It is, however, agreed that precocious children should receive physical attention, while their intellectual bent should not be too much fostered. It is popularly supposed that precocious children are subject to diseases of the nervous system, various scrofulous symptoms, rickets, a stunted body, and other tokens of constitutional enfeeblement, and that they are prone to subsequent mental degeneration, if not to idiocy and premature death. On the other hand, Sully, Galton, and other writers deem an early manifestation of genius not incompatible with a prolonged development. From data furnished by Sully, Donaldson concludes that of 287 geniuses (musicians, painters, sculptors, scholars, poets, scientific men, novelists, and philosophers), 80 per cent. gave distinct signs of promise before 20, 80 per cent. produced work before 30, 84 per cent. attained fame before 40. Musical talent is especially apt to be precocious; only 6 per cent. of the great composers failed to show marked ability as children.

Galton, *Hereditary Genius* (ib., 1892); Lang, "Genius in Children," *North American Review*, vol. clxiv. (New York, 1897).

PRECOGNITION (Lat. *præcognitio*, foreknowledge, from *præcognoscere*, to know beforehand, from *præ*, before + *cognoscere*, to know). In Scotch law, an examination before a judge ordinary or justice of the peace, corresponding to a preliminary examination under penal statutes and the taking of depositions in the United States. In Scotch practice the term is also applied to an examination of witnesses by a solicitor before the trial of a civil cause, at which time it is customary for him to write down the substance of their testimony, the writing itself being sometimes called a precognition.

PREDESTINATION (Lat. *prædestinatio*, from *prædestinare*, to determine beforehand, from *præ*, before + *destinare*, to determine). A theological term signifying the eternal decree of God whereby certain men are appointed unto salvation. The opposite decree is called that of reprobation. The two ideas of an eternal God who works by plan in governing the world, and of such a sinful condition among men as demands the active interference of God by grace if any are to be saved, logically lead to the idea of predestination. This connection of thought is found in Saint Paul, was elaborated by Augustine, and established in the Reformed theology by Calvin. The term, by its connection with the word destiny, conveys an unfortunate implication, as if predestination had to do with fate. Theologians have always, however, maintained that predestination did not destroy the freedom of the will. With Augustine, predestination is an affair of grace, and concerns chiefly what God will Himself do, the persuasives He will employ to elicit the good choice of the will. He made no attempt to exhibit the reasons why some are brought to faith and salvation and others not. It was a matter of the inscrutable wisdom and mercy of God. In this reticence he has been imitated by most of his followers. Negatively, the Reformed theology emphasized with great force the position that the predestination of God did not depend upon the divine foreknowledge of faith which would be exercised by the elected individual, for that faith, as the entrance into the kingdom of God and the condition of salvation, is the result of the election. They did not, however, exclude all foreknowledge of the individual. The Arminians were sometimes thought to condition predestination upon foreknowledge of faith, but no creed states this (except certain creeds of the Greek Church). The main contention of Augustine, that salvation begins in the initiative of God, is generally accepted by evangelical Christians; but the adjustment of this position to human freedom is a point in reference to which much diversity prevails. In recent times the drift of opinion has been against efforts to make such an adjustment, and the current of discussion has carried theological interests into other departments of thought. Present tendencies are to emphasize the known, the facts of consciousness, and avoid inferences of a precarious nature as to the unknown. Consult: the

treatises on systematic theology, particularly Hodge (New York, 1871-72); Mozley, *A Treatise on the Augustinian Doctrine of Predestination* (London, 1878); Forbes, *Predestination and Free Will* (Edinburgh, 1879). See ARMINIANISM; AUGUSTINE, SAINT; CALVINISM; ELECTION; FREE WILL.

PREDICABLE (Lat. *prædicabilis*, what may be spoken of, from *prædicare*, to declare, from *præ*, before + *dicare*, frequentative of *dicere*, to say). A term in the scholastic logic connected with the scheme of classification. There were five designations employed in classifying objects on a systematic plan—*genus*, *species*, *difference*, (differentia), *property* (proprium), and *accident* (accidens). Genus is the name of any class—marked off by some attribute or attributes, called generic—subdivided into further classes, which are called the species of the genus. The other three designations—difference, property, accident—are names given to attributes, other than the generic, possessed by objects classified. The difference, or more frequently the specific difference, is what distinguishes classes which are called species of the same genus; as, for example, the peculiarities wherein the cat differs from the tiger, lion, and other species of the genus *felis*. The property designates any mark peculiar to a class but not used as a basis of classification. Thus, 'the use of tools' was regarded as a property of man, for it was thought to be an exclusively human characteristic, and yet was not used as the basis for classifying man as a species distinct from apes, etc. The accident is any feature which is neither a generic attribute, a specific difference, nor a property. For instance, the high value of gold is an accident; gold would still be gold though it were plenty and cheap. There is much confusion of thought and conflict of usage in connection with the terms property and accident. It would be well to omit the term property from consideration altogether. Then accident would be an inclusive term comprehending all the qualities which are neither generic nor specific. Consult the logical works mentioned under LOGIC.

PREDICATE. See JUDGMENT.

PREDIS, *prâ'dès*, AMBROGIO DE (c.1455-c.1515). An Italian painter, born probably in Milan. He is supposed to have been first taught by Christophorus de Predis, the miniature painter, and was afterwards influenced by Vincenzo Foppa and Leonardo, to the extent that his works have been confounded with theirs for many years. He was the favorite painter of Ludovico Sforza, il Moro, and probably went to Innsbruck in 1499 with the Duke and his family. The portrait by him of the Emperor Maximilian (dated 1502), who married Bianca Sforza, is in the Vienna Gallery. De Predis was rescued from oblivion by Giovanni Morelli, the great art critic, who credits him with the following portraits: a female portrait in the Ambrosiana, Milan, hitherto ascribed to Leonardo; Gian Galeazzo Maria Sforza, belonging to Count Porro at Milan; Francesco de Bartolommeo Archinto, in the collection of Fuller-Maitland, London; two profile portraits in the *Libro del Jesus*, belonging to Prince Trivulzio, Milan; two portraits of youths, in the Bergamo gallery, and another in the Poldi collection in Milan. De Predis is one of the most interesting painters of the Milanese

school, despite certain defects of drawing. Consult Morelli, *Italian Painters* (London, 1892).

PRÆMPTION (ML. *præemptio*, a buying before, from Lat. *præ*, before + *emptio*, purchase, from *emere*, to buy). In international law, the right of a nation to seize provisions and other articles belonging to a foreign nation or its citizens, while they are being shipped across the territory of the former, as being probable contraband of war, and for which proper compensation or indemnity is made to the owners. The English rule is to pay the market value of the goods seized, together with a reasonable probable profit, usually estimated at 10 per cent. on that amount. By the treaty of November 19, 1794, between the United States and Great Britain, certain articles, as munitions of war and naval stores, were classed as absolute contraband of war and subject to confiscation, and it was further stipulated that all other articles seized as contraband of war should be bought at a reasonable price and the owner indemnified for all damages sustained thereby. See CONTRABAND OF WAR; INTERNATIONAL LAW; and consult the authorities mentioned under the latter title.

In the English law, the term præemption is employed to denote a contract right to buy real property, in event of a sale, at a price equal to or greater than the highest price offered by any other person to the owner within the stipulated time. This sort of a right is commonly included under the phrase 'option to purchase,' in the United States.

PRÆMPTION RIGHT. A right formerly given to citizens of the United States under our public land laws to buy a quarter section of public lands at a limited price in preference to all other persons, provided they complied with certain regulations. The præemption laws were repealed by act of Congress, March 3, 1891 (26 U. S. Stat. at Large, p. 1097), but the rights of those who had previously filed their claims were saved. This means of acquiring public land differed from the homestead laws, which require occupation and cultivation. See HOMESTEAD LAWS; PUBLIC LANDS.

PRÆESTABLISHED HARMONY. THE DOCTRINE OF. The theory propounded by Leibnitz to account for the empirical fact that a regular connection exists between changes in the body and modifications in the mental life, and for the correspondence between the experiences of different persons. Leibnitz held that the bodily changes do not cause the mental changes, and that the correspondence between the experiences of different persons are not due to external influences working on them from without, but that from the beginning God has so ordained the course of each person's life that there shall be such a correspondence between his experiences and his bodily changes, and between the experiences of different persons under like conditions. This view differs from occasionalism (q.v.), propounded by Geulinx, in that the latter holds that the correspondence is produced by God *at the particular time* on occasion of what we call causes, while according to the doctrine of præestablished harmony the correspondence has been *previously* ordained and leaves no necessity for the perpetual intervention of God.

PRÆEXISTENCE, DOCTRINE OF. The belief that human souls were in existence before the

generation of the bodies with which they are united in this world. The idea has always been widely spread throughout the East. The Greek philosophers too, especially those who held the doctrine of transmigration (q.v.), as the Pythagoreans, Empedocles, and Plato, were familiar with the conception. With some of the early Christians, as Origen, the assumption of such præexistence was connected with the belief that God had created the souls of men before the world, and that these were united with human bodies at generations or at birth. Subsequently the followers of this opinion were termed *præexistencists*, to distinguish them from the *traducianists*, who held that children received soul as well as body from their parents. Direct interest in this doctrine has nearly ceased in modern times, although in the later philosophy of Germany it has been revived by the younger Fichte; it also forms the basis of Julius Müller's *Die christliche Lehre von der Sünde* (Breslau, 1839; 2d ed. 1888; Eng. trans., Edinburgh, 1856), and is involved in the theory of a universe consisting solely of eternal conscious personalities each *causa sui*, advocated by Howison in *The Limits of Evolution* (New York, 1901).

PREFECT (Lat. *præfectus*, overseer, governor, from *præficere*, to set over, from *præ*, before + *facere*, to make). The title of many officers and magistrates in ancient Rome. The most important was the *præfectus urbi*, or city warden, an appointive office of high rank established in very early times. In the kingly period the city prefect represented the King during his absence from the city in time of war, and under the Republic he performed the same office for the consuls, being himself always an ex-consul. Later, with the establishment of the office of city prætor (see PRÆTOR), that of city prefect lost its importance, until renewed in the reorganization of the government by Augustus. It now became an Imperial magistracy of very high importance, and, as before, only ex-consuls were eligible. The duty of the *præfectus urbi* was to maintain order in Rome; he was thus a sort of chief of police, as in France and Italy to-day. Other prefects of high (senatorial) rank under the Empire were the *præfectus alimentorum*, in charge of the public grain supply; the *præfectus ararii Saturni*, or head of the civil treasury and the *præfectus ararii militaris*, or head of the military treasury. Members of the second, or equestrian, rank were eligible, under the Empire, to another class of prefectures, of which the most important was the command of the Emperor's body-guard (the 'prætorian guard'), with the title *præfectus prætorio*. The power of the prætorian prefect was often great enough to cause the overthrow of an emperor and dictate the choice of his successor. The *præfectus annonæ*, in charge of the free distribution of grain to the poor, and the *præfectus Ægypti*, viceregent of the Emperor in Egypt, were both men of equestrian rank, as were also the admirals stationed at the navy-yards of Ravenna and Misenum (*præfecti classis*) and the captain of the city police (*præfectus vigilum*). In the army also there were prefects in charge of the camp, and of the separate legions, cohorts, and *ala*. Finally, in some towns of Italy the highest local magistrate had the title of *præfectus iure dicundo*.

PREFORMATION (from Lat. *præformare*, to shape beforehand, from *præ*, before + *formare*,

to shape, from *forma*, shape). A view originating in the seventeenth century with Malpighi and Bonnit. They assumed that the germs of all coming generations were contained in one primordial egg. According to this view all the parts and organs of the chick are present in the germ or egg, there being no differentiation, but only an unfolding of parts ('evolutio') existing, infinitesimal in size, in the egg. Haller emphatically stated that there was no such thing as the differentiation of parts, that no part of the body was made before another, but that all the organs were simultaneously created. It logically followed that the germ destined to give origin to the animal—the ovum according to ovulists, the sperm as claimed by the spermatists (q.v.)—contained within itself the germ of the next generation, that of the next after, and so on indefinitely, so that the first created male or female of each species contained within its sperms or ova the germs of all future generations, inclosed within one another, like a nest of Chinese boxes. The theory of incasement (emboitement) propounded by Swammerdam in 1733 was that the form of the larva, pupa, and imago of the butterfly preëxisted in the egg, and even in the ovary; and that the insects in these stages were distinct animals, contained one inside of the other. This explanation Swammerdam extended to the entire animal kingdom.

Consult, for recent statements, Delage, *La structure des protoplasma et les théories sur l'hérédité* (Paris, 1895); Parker and Haswell, *Text-book of Zoölogy* (New York, 1897); Packard, *Text-book of Entomology* (New York, 1898).

PREGEL, prä'gël. The principal river of East Prussia, formed by the confluence of the Ister and the Angerapp, below Insterburg (Map: Prussia, J 1). It flows in a western direction and enters the eastern end of the Frisches Haff about 5 miles below Königsberg. Its total length is about 80 miles and it is navigable from Insterburg.

PREGNANCY. See OBSTETRICS; MENSTRUATION.

PREHNITE (named in honor of Colonel *Prehn*, who discovered it at the Cape of Good Hope in the latter part of the eighteenth century). An aluminum-calcium orthosilicate that crystallizes in the orthorhombic system. It has a vitreous lustre and is light green to white in color. It is widely distributed and occurs in eruptive rocks, usually associated with zeolites, fine specimens being found in France, the Harz Mountains, and Scotland, and in the United States at Bergen Hill and Patterson, N. J., and in the Lake Superior copper region. When cut and polished it yields a gem resembling chryso-prase in color and lustre, and polished slabs have been cut from masses in China.

PREL, prä'l, KARL, Baron du (1839-99). A German philosophic author. He was born at Landshut, studied at Munich, and, after thirteen years (1859-72) in the Bavarian army, devoted himself to philosophy. His chief works are: *Oncirokritikon*. *Der Traum vom Standpunkte des transcendentalen Idealismus* (1868), which won him an honorary doctorate from Tübingen; *Der Kampf ums Dasein am Himmel* (1874; 3d ed., *Entwicklungsgeschichte*, 1882); *Die Philosophie der Mystik* (1885; Eng-

lish version, 1889); *Die Mystik der alten Griechen* (1888); and *Die Magie als Naturwissenschaft* (1899). His selected works in fifteen volumes were published at Leipzig in 1900.

PRELATE (ML. *prælatus*, prelate, Lat. *prælatus*, set before, p.p. assigned to *præferre*, to set before). A title given to certain ecclesiastics of a higher order, usually to patriarchs, metropolitans, archbishops, bishops, and in the Roman Catholic Church to the heads of religious houses and certain other officials. In the Roman Curia many such officials, although not bishops, wear the episcopal purple and are addressed as 'Monsignore' and 'Right Reverend.' These prelates are often intrusted with weighty diplomatic and other missions, and their office is commonly a training-school for the cardinalate. By the derived term prelacy is understood such an ecclesiastical polity as provides for a gradation of the clergy in rank, as distinguished from a system in which all the clergy are on an equality.

PRELL, HERMANN (1854—). A German historical painter, born at Leipzig. He was a pupil of Grosse in Dresden and of Gussow in Berlin, then went to Italy to study fresco painting, in which branch he produced his most important works, to wit: eleven mural paintings symbolizing the "Main Epochs in the History of Architecture" (1881-82, Banquet Hall, Architects' Union, Berlin, for which he also painted a ceiling-piece in oil, "Ars Vietrix," 1886); "Justice" and "Valor," and "Henry IV. Granting Privileges to Worms in 1074" (City Hall, Worms); cycles of historic episodes and allegorical scenes, respectively, in the City Halls at Hildesheim (1888-92) and Danzig (1896), and in the staircase of the Breslau Museum (1894); mythological scenes in the Albertinum, Dresden (1900). Of his easel pictures the Dresden Gallery contains the "Betrayal of Christ" (1886), and the Breslau Museum a "Repose in Egypt" (1890). The cartoons to his Hildesheim frescoes were awarded the great gold medal in Berlin in 1893. From 1886 to 1891 he taught at the Berlin Academy, then was appointed professor in Dresden. He published *Die Fresken im Rathaus zu Hildesheim* (1894) and *Die Fresken im Treppnhaus des Schlesischen Museums*, text by Janitsch (1895). For his biography, consult Meissner (Vienna, 1897) and Rosenberg (Bielefeld, 1901).

PRELLER, FRIEDRICH (the Elder) (1804-78). A distinguished German landscape painter, to whom the "historic" landscape owes its highest development in the nineteenth century. Born at Eisenach, April 24, 1804, he removed in infancy with his parents to Weimar and early gave proof of artistic talent. Through Heinrich Meyer (q.v.), who subsequently was his instructor, Goethe became interested in him and henceforth influenced the development of the young artist. In 1821 Preller went to Dresden, where he copied after Ruisdael and Potter and was much impressed by the works of Claude Lorrain and Poussin. Back at Weimar, his work attracted the attention of the Grand Duke Charles Augustus, who in 1824 took him to Antwerp, where Preller now devoted two years to the study of the human figure at the Academy under Van Brée. With a stipend from the Grand Duke, he went in 1826 to Milan, and in 1828 proceeded to Rome, where an intimate acquaintance with antique models and the master works of the Italian

Renaissance, together with the mighty impulses received through the influence of Koch and the closest study of Claude and Poussin, fully developed his powers. On a trip to Naples in 1830 he first conceived the idea of his life-work, the "Odyssey Landscapes," and there he also met Dr. Härtel, who was to give him the first opportunity to realize his dream, by commissioning him in 1832 to paint in his Roman house at Leipzig "Seven Scenes from the Odyssey" (1834). Landscape and figure elements appear there in their intimate relation, blended into an harmonious whole. Preller succeeded Meyer as professor at the school of drawing in 1832 and received at the same time the commission to execute "Six Thuringian Landscapes with Historical Figures" for the ducal palace. There he also painted in tempera "Five Scenes from Oberon" (1834-39) in the Wieland room. Among the results of journeys to the isle of Rügen (1837 and 1839) and to Norway (1840), the views of the sublime Norwegian coast scenery, well represented by three specimens in the Weimar Museum, one (1850) in the Dresden Gallery, and one (1853) in the National Gallery, Berlin, are especially noteworthy.

More than twenty years elapsed before he found occasion to resume his favorite theme and to compose an enlarged version of the "Odyssey Landscapes" in sixteen charcoal drawings (1854-56, National Gallery, Berlin), which on their exhibition in Munich, 1858, produced an immense impression. The monumental execution of this cycle being secured by the Grand Duke Charles Alexander for the new Museum at Weimar, Preller started for Italy in 1859 to make new studies, which resulted in another modified series of sixteen compositions, the cartoons (1860-63) having found a permanent place in the Leipzig Museum and the encaustic paintings, executed 1865-68, constituting one of the chief ornaments of the Weimar Museum. The cycle traverses Homer's entire narrative. In the meanwhile he had also painted the easel pictures of "Calypso" and "Leucothea" for the Schack Gallery in Munich, and of "Nausicaa" for the Raczynski Gallery in Berlin. Two further sojourns in Italy (1869 and 1875) occasioned another series of fine oil paintings, of which the "Rape of Nymphs by a Centaur" (1874) adorns the Dresden Gallery and "Acqua Acetosa Near Rome" (1874) is the most remarkable. Preller also has twenty-eight plates of excellent etchings (1832-47) to his credit. Productive and planning to the last, he died, after a short illness, at Weimar, April 23, 1878, and was buried on his birthday. Consult: Atkinson, in *Art Journal* (London, 1881); Roquette, *Friedrich Preller* (Frankfort, 1883); Pecht, *Deutsche Künstler des neunzehnten Jahrhunderts*, i. (Nördlingen, 1877); Reber, *Geschichte der neueren deutschen Kunst*, ii. (Leipzig, 1884); Rosenberg, *Geschichte der modernen Kunst*, ii. (ib., 1899); Schöne, *Friedrich Prellers Odysseelandschaften* (ib., 1863); and Jordan, *Die Odyssee in Prellers Darstellung* (ib., 1873).

PRELLER, FRIEDRICH (the Younger) (1838-1901). A German landscape painter, born at Weimar, the son, pupil, and worthy follower of Friedrich the Elder, whom he accompanied to Italy in 1859. He studied there until 1862, and again in 1864-66 in Rome. In 1867 he settled in

Dresden, where he found a wider sphere for his activity and in 1880 became professor at the Academy. Developing into a fine colorist, he surpassed even his father in point of technique, and with predilection chose for his subjects scenes with historic associations, such as the "Gulf of Baja," the "Forum Romanum," "Monastery of Santa Scolastica, Near Subiaco" (1872, Dresden Gallery), "Landscape with Sappho" (1879, Leipzig Museum), and "Pieve di Cadore," the home of Titian (1880). His mural paintings of mythological and historic landscapes in the Albrechtsburg at Meissen (1878), in the Royal theatre, the Albertinum (1891), for which he made special studies in Greece in 1890, and in the university (1897), number among the best of their kind.

PRELUDE (OF. *prelude*, Fr. *prélude*, from Lat. *præluere*, to play before, from *præ*, before + *luere*, to play). In music, a short preface or introduction to a more extended movement or composition, or to a dramatic performance or church service. It is in the same key with the selection which it is to introduce, and to which it is intended as a preparation. For a long time the prelude constituted an essential portion of the older sonata and suites. In the seventeenth century Corelli in his *Sonate da Camera* introduced the custom of beginning all such works with *preludio* in slow time; hence the *introduction* (q.v.) in our modern sonatas and symphonies. The German composers developed this idea. In some of the suites of J. S. Bach the prelude is as important as any of the regular movements. When this master wrote the *Well-Tempered Clavichord* he prefaced each fugue with a prelude. Bach's *organ preludes* are masterpieces, notably the magnificent one in E flat introducing the Saint Ann's fugue. Mendelssohn followed Bach in his six *Preludes and Fugues* for piano (op. 35). Chopin wrote a book of preludes which rank among the most beautiful of his shorter compositions, but they are entirely independent compositions, complete in themselves. Richard Wagner, from the time of his writing *Lohengrin*, uses the word prelude (*Vorspiel*) instead of overture. He aimed to give in the orchestra introduction to his dramatic works either a complete synopsis of the drama or its fundamental idea. He has, indeed, done this also in his overtures to *The Flying Dutchman* and *Tannhäuser*. Only in *Lohengrin* does the prelude end with a complete cadence; in all the other works the prelude leads without a cadence directly into the first act. See FORM; OVERTURE.

PREMILLENARIANS. See ADVENTISTS; MILLENNIUM; MILLER, WILLIAM.

PREMISE (in logic). See SYLLOGISM.

PREMISES (OF. *premissæ*, Fr. *prémisse*, from ML. *præmissa*, premise, fem. sg. of Lat. *præmissus*, p.p. of *præmittere*, to send before, put before, from *præ*, before + *mittere*, to send, Skt. *miv*, to push). In law, 'premises' was originally employed exclusively to describe the introductory part of any legal writing, which usually contains preliminary statements or descriptions, necessary to a complete understanding of the main body of an instrument, as the 'stating' part of a bill in equity, or the part of a deed which precedes the *habendum* clause, and which contains a description of the property conveyed. As a result of this custom of speaking of the description of

the property in a deed as the premises, popular usage has extended the meaning of the term to include lands, tenements, and hereditaments themselves.

PREMONSTRATENSIANS, called also **NORBERTINES**. A religious Order which, during the four centuries from the twelfth to the sixteenth, was one of the most numerous and powerful monastic bodies in Europe. Its houses were especially numerous in Germany, but there were many monasteries also in England, where, because of the color of their habit, the Norbertines were called White Canons. The Order was founded by Saint Norbert, a native of Xanten, in the Diocese of Cleves, who was born about 1080. Norbert's youth had been irregular, but, converted at the age of 35, he afterwards lived very strictly, devoting himself to the conversion of others. While engaged in this work he realized the need for missionaries to help the local clergy. He was soon joined by thirteen companions to whom he gave the rule of Saint Augustine, and founded his first monastery in the forest of Coucy, near Laon, at a place called Pré Monstré (the field shown), or Prémonstré (foreshown), because Norbert felt that this was the place that had been pointed out to him by a vision. This became the mother house and the Order came to be named from it. The rule adopted by Saint Norbert was very strict. It imposed perpetual fasting, that is, allowed only one meal a day, not to be taken before noon, and required entire abstinence from meat. Besides the daily chanting of the office, the monks were bound to the duties of preaching and hearing confessions in connection with the parish clergy.

The Order spread rapidly, first in France and the Low Countries, and, after Norbert's election (1127) as Archbishop of Magdeburg, also in Germany. The abbot of the mother house at Coucy held the rank of general and was superior of the entire Order. This continued to be the case until the French Revolution. Saint Norbert also founded an Order of nuns which spread almost as rapidly and as widely as that for men. At the end of the fifteenth century the Premonstratensian Order had not less than 1500 monasteries for men and 500 for women, most of them situated in France, Germany, and England, for the Order never made much progress in Italy or Spain. It maintained its first fervor for several centuries, but mitigations of the rule gradually crept in and were followed by relaxations, which made various reforms necessary. Toward the close of the sixteenth century (1573), as the result of the Catholic reaction that followed the Council of Trent, a reform movement similar to that in the Franciscan Order made considerable modification of the existing Premonstratensian Institute. The reformed communities remained united with the older body, however, and in 1630 the modified rule was accepted by all the communities. Since the end of the seventeenth century the Order has declined in numbers. The female branch became almost extinct in the eighteenth century. There was a reawakening in the nineteenth century in the male branch, but the Order has suffered much from suppression in Italy, Spain, the German Empire, and Switzerland. It flourishes in Austria and Holland, however, and there are some houses in England. In the United States there is a house at De Pere, Wis., which was founded from the

Abbey of Heeswijk (Holland). Consult Currier, *History of Religious Orders* (New York, 1894).

PRENCE, or PRINCE, THOMAS (c.1600-73). An American colonist, born at Lechdale, in Gloucestershire, England. He was one of the company of Puritans that settled in Leyden, Holland, and in 1621 he followed the Pilgrims to New Plymouth. He was a man of considerable wealth, and soon became a person of influence in the colony and was chosen to fill its most responsible offices. He was elected Governor in 1634 and 1638, and annually from 1657 until his death in 1673, the law requiring the Governor to live in Plymouth being waived in his favor. From 1635 until 1637 and from 1639 until 1656 he was one of the assistants, and in 1654 he was sent to Kenebec patent, where he established a government subordinate to that at Plymouth. In religious affairs he represented the intolerance of his age, but, on the other hand, he may be considered the founder of the New England public schools, for he zealously advocated the establishment of a system of free education and secured the passage of a law appropriating the profits of the Cape Cod fisheries to the support of a school in Plymouth. Consult Baylies, *An Historical Memoir of the Colony of New Plymouth* (1866).

PREN'DERGAST, SIR HARRY NORTH DALRYMPLE (1834—). An English soldier, born in India. He was educated at Brighton College and the East India Company's College at Addiscombe, entered the military service in 1854, was with the sappers and miners during the Persian War of 1856-57, and as a member of the Central India field force distinguished himself in 1858. In the Abyssinian War (1867-68) he commanded the detachment of Madras sappers and miners, and in 1885-86 he commanded the expedition which obtained the annexation of Upper Burma to the British Empire. He then (1886) commanded all the British forces in Burma, and subsequently occupied various posts, including that of officiating resident at Mysore and chief commissioner of Coorg in 1891-92. In 1887 he attained the rank of general of Royal Engineers.

PRENDERGAST, JOHN PATRICK (1808-93). An Irish politician and historian, born at Dublin. He was educated at Trinity College, Dublin, was admitted to the bar in 1830, and was active as a writer of pamphlets and newspaper articles from the Liberal Nationalist point of view. His chief work was, however, in connection with Irish history, in which he published the following studies: *The History of the Cromwellian Settlement of Ireland* (1863; 2d ed, 1875); *The Tory War in Ulster* (1868); and *Ireland from the Restoration to the Revolution* (1887).

PRENTICE, GEORGE DENISON (1802-70). An American journalist, born at Preston, Conn. He graduated at Brown in 1823, studied law and was admitted to the bar, but never practiced, and in 1828 became the first editor of the *New England Review*. In 1830 he removed to Kentucky and there published his popular campaign life of Henry Clay (1831). He established in the Whig interest at Louisville in 1830 the *Journal*, which soon came to be the best edited and most read newspaper in that section. He did much to increase the *Journal's* circulation and his own fame through originating the brief, pointed paragraph, theretofore almost unknown. A collection of these

paragraphs, edited by himself, appeared in 1860 as *Prenticiana* (rev. ed. 1870). Prentice was a vigorous opponent, and was so frequently involved in duels as to become a subject of jest. He was antagonistic to secession, and it is said that his editorials had an important influence in keeping Kentucky from withdrawing from the Union. He published in the *Journal* considerable verse, later edited by Piatt (Cincinnati, 1876). He also contributed for some time a column of 'Wit and Humor' to Bonner's *New York Ledger*. He retired from the editorship of the *Journal* in 1867. Consult the sketch by Piatt, in the edition of the *Poems* above referred to, and Watterson, *Memorial Address* (Cincinnati, 1870).

PRENTISS, BENJAMIN MAYBURY (1819—). An American soldier, born at Belleville, Va. (now W. Va.). In 1841 he settled in Quincy, Ill., and three years later he became first lieutenant of a militia company, organized to aid in quelling the Mormon disturbances. He served during the Mexican War as a captain of volunteers, and at the outbreak of the Civil War organized a company which he offered to the Federal Government. Soon afterwards he was appointed colonel of the Seventh Illinois, and on May 17, 1861, was promoted to the rank of brigadier-general of volunteers, and was given command of Cairo, then one of the five principal military centres of the Union. In September, however, he was succeeded by General Grant. On December 28, 1861, he defeated the Confederates at Mount Zion. On April 3, 1862, he joined Grant at Shiloh and was given command of the new Sixth Division, composed of raw troops. This division with that of Sherman occupied the most exposed position, and upon them fell the unexpected onslaught of the Confederates on April 6th. After making a creditable resistance General Prentiss and the greater part of his division surrendered. He was exchanged in October, and the next month was commissioned a major-general of volunteers, while attending the court-martial called to try Fitz John Porter (q.v.). On July 3, 1863, while commanding at Helena, Ark., he repulsed an attack by a superior force of Confederates under Generals T. H. Holmes and Sterling Price. On October 28, 1863, he resigned his commission.

PRENTISS, GEORGE LEWIS (1816—). An American clergyman. He was born at Gorham, Me., graduated at Bowdoin College in 1835, and taught for a year in Gorham Academy. Following this he went abroad and spent two years at the universities of Halle and Berlin. After a period in England, he returned to America and became pastor of the South Trinitarian Church, New Bedford, Mass., in 1845. From 1851 to 1858 he was pastor of the Mercer Street Presbyterian Church, New York, resigning to seek health by foreign travel. In 1860 he began the organization of the Murray Hill Church of the Covenant, New York, and served as its pastor from 1862 to 1873, when he was made professor of pastoral theology, Church polity, and mission work in Union Theological Seminary. In 1896 he became professor emeritus. His most important published work is *The Union Theological Seminary in the City of New York, Historical and Biographical Sketches of Its First Fifty Years* (1889), and a supplementary chapter dealing with the history of the veto power of the General Assembly over the election of professors of Union Seminary and its application to Dr. Charles A.

Briggs, entitled *The Agreement Between Union Seminary and the General Assembly* (1891). His wife, ELIZABETH PAYSON PRENTISS (1818-78), was born in Portland, Me., a daughter of the Rev. Edward Payson. She was educated in Portland and Ipswich, taught school for a few years, and was married to Dr. Prentiss in 1845. She was the author of books for children and several popular religious works, the most important of which was *Stepping Heavenward* (first published serially in the *Chicago Advance*, 1869). Her life and letters were published by her husband (New York, 1882).

PRENTISS, SEARGENT SMITH (1808-50). An American lawyer and orator, born in Portland, Me. At the age of nineteen he graduated at Bowdoin College, and then settled in Natchez, Miss. Here he supported himself for two years by private tutoring, and at the same time studied in a law office. He was admitted to the bar in 1829, and his keen intellect and unusual oratorical ability made him at once successful. In 1832 he removed to Vicksburg, where he soon became very influential. In 1835 he was elected to the State Legislature by the Whigs, and two years later was returned to Congress, but was unseated. He was reelected, however, in the following year, and this time was allowed to serve. In 1840 he made speeches in many parts of the country in support of W. H. Harrison, but withdrew from politics in 1842, and thereafter took but little part in public affairs save in opposing the repudiation of the State debt. In 1845, having by an unfavorable legal decision lost much of his property, he removed to New Orleans and practiced with success in that city. Of his speeches, which were much admired by such contemporaries as Edward Everett and Daniel Webster, only a few have been preserved. His life was written by his brother, George Lewis Prentiss (2 vols., New York, 1855 and 1870). Consult, also, Lynch, *Bench and Bar of Mississippi* (New York, 1881).

PRENZLAU, prēnts'lou, or **PRENZLOW**. A town in the Province of Brandenburg, Prussia, on the Ucker and the Lower Ucker Lake, 58 miles north-northeast of Berlin (Map: Prussia, E 2). Among its churches is the handsome Gothic Saint Mary's, built of brick. The town has a gymnasium and a teachers' seminary. Sugar, cigars, machinery, woolen yarn, leather, oleomargarine, and finished wood products are manufactured. Prenzlau is first mentioned in the twelfth century, and was the capital of the Ucker Mark. It is noted as the scene of the surrender of the Prussians under Hohenlohe to the French under Murat in 1806. Population, in 1890, 18,019; in 1900, 20,228.

PREPARATION (Lat. *præparatio*, from *præparare*, to make ready beforehand, from *præ*, before + *parare*, to make ready). A term in music applied to the introduction of dissonances. According to the older theorists no dissonance could be introduced without being *prepared*, i. e. the note forming a dissonance had to occur in the preceding chord and in the same part as a note of harmony. Modern composers are very free with the introduction of dissonances. See CONSONANCE; DISSONANCE.

PREPOSITION (Lat. *præpositio*, from *præponere*, to place before, from *præ*, before +

ponere, to place). In grammar (q.v.), an indeclinable word preceding a noun or a pronoun in an oblique case and showing the relation of such a noun or pronoun to another noun, pronoun, adjective, or verb. Originally the preposition was only a specialized form of the adverb, and is consequently in the last analysis a stereotyped case-form of a noun. Thus the Indo-Germanic **peri*, 'around,' which is represented by Sanskrit *pari*, Greek *περ*, Latin *per*, Gothic *fair*, and German *ver-* in such verbs as *vergehen*, 'to go to destruction,' was primarily the locative case of an inferred noun **per-*, connected with the verbal root **per*, 'to cross.' The adverbial nature of prepositions is shown by their use in verbal compounds, as Latin *per astra*, 'through the stars,' beside *perire*, 'to go through, to perish.' In an earlier period the preposition did not "govern its case." The preposition was purely adverbial and the case of the noun depended altogether on other syntactic considerations. In such a sentence as Latin *it ad flumen*, 'he goes to the river,' *ad* primarily pointed out the direction, while *flumen* was an accusative denoting in itself the end of the motion implied in the verb. The decay of feeling for the force of inflectional endings led to an increased value of prepositions, which developed from local adverbs to words which actually governed case relations. The term preposition is a faulty one, as these words may in many languages stand after the noun which they govern, and they are then sometimes called postpositives or postpositions. In English the preposition has lost in great part its adverbial character, although traces of this value survive in such uses as 'to see a thing through,' as compared with 'to see through a thing.' As connectives they govern the objective case only, as in *the house*, *to the house*, *from the house*, where more conservative languages would employ a locative, an accusative, and an ablative respectively. The possessive case has been supplanted in great measure by the objective case with *of*. The principle is frequently maintained that a phrase or sentence should not end with a preposition, on account of the weak termination thus given. Many of the best literary authorities, however, disregard this, and there is no good reason for a rigid observance of such a rule either on stylistic or on historical grounds. Consult Delbrück, *Vergleichende Syntax der indogermanischen Sprachen*, vol. i. (Strassburg, 1893).

PREPOTENCY (Lat. *præpotentia*, superior power, from *præposse*, to be superior in power, from *præ*, before + *posse*, to be able). The power of exerting a preponderating influence in the act of reproduction. Thus some one male ancestor excelling in some physical or mental character, such as form, color, and disposition, is known to have transmitted his qualities through many generations. Not only may the individuals of a normal species thus transmit their marked or superior qualities, but also aberrations or 'sports' may thus be transmitted, unless bred out by crossing. In certain historic families some one ancestor, and after him others in the same family have shown great power in transmitting their likeness through the male line, as in the case of the Austrian emperors of the House of Hapsburg, and so with the mental qualities of certain Roman families. It is especially noticeable among domesticated animals, where qual-

ities and ancestry have long been recorded. The famous bull 'Favorite' is said to have exerted a prepotent influence on the short-horned race of cattle. A ram of a goat-like breed of sheep from the Cape of Good Hope had offspring scarcely distinguishable from himself when crossed with ewes of twelve other breeds. Other cases are mentioned by Darwin. Darwin says that the law of prepotency acts when species as well as when races or individuals are crossed, giving examples among plants. The jackal is prepotent over the dog, the ass over the horse, and this runs more strongly through the male than the female ass. The intricacy of prepotency is reiterated by Ewart, and is likely to be difficult to understand until the laws of heredity are better understood. He says the leader of any given wild herd may be decidedly prepotent, but unless he is mated with members of some other herd presenting different characters the prepotency may escape notice. The Jews are more prepotent than the English race, are of better, i.e., purer breed, but the prepotency only declares itself when intermarriages take place. In nature prepotency may (1) arise spontaneously and abruptly along with sports in one or more directions, or gradually with the help of natural selections; (2) it may be gradually acquired when a few individuals of any given species or variety are so isolated that inbreeding is inevitable. In cases of crosses between different breeds, says Redfield, prepotency appears to lie with that breed which has had its characters most firmly fixed by in-and-in breeding. Hence animals of pure blood are prepotent over mongrel stock. In the life of an individual a character is more firmly fixed in middle life than in youth, and observation has shown among horses that the older individual is or tends to be more prepotent than young males.

PRERADOVIĆ, prá-rá'dó-vich, PETER (1818-66). A Croatian poet, born at Grabonitz. He entered the Austrian Army in 1830 and rose to the grade of general (1866). When he was stationed in Dalmatia (1842), he took up the study of his native tongue, which he had almost forgotten, and began to write in that language. His works, which rank him as the greatest Croatian poet of the century, include *Procnci* (1846), *Nove pjesme* (1851), and the epics *Provi Ujuti* and *Slavenski Dioskuri*. The collected edition, published at national expense (1872), contains a biography and criticism of Preradović by Trnski. A few of his poems were turned into German by Spicer (1895).

PRE-RAPHAELITES. A term which, properly signifying the Italian painters before Raphael, is now commonly applied to their imitators in the nineteenth century. It was first used in this sense of a group of young German artists who, after their expulsion from the Vienna Academy in 1810, established themselves in the deserted Franciscan convent of San Isidoro at Rome. They formed an art brotherhood which was to live in seclusion and sanctity, and were nicknamed "The German Lay Brothers," and afterwards "The Nazarenes." Their object was the restoration of Christian art to its mediæval purity, and they took as their guides the Pre-Raphaelite masters. They regarded the mental

conception as the chief feature of a work of art, and form as the chief vehicle of its expression, color being subsidiary. The leader and moving spirit of the school was Overbeck (q.v.); other members were Cornelius, the brothers Schadow, Philip Veit, Selnorr von Carolsfeld, Führieh, and Steinle. They afterwards scattered throughout Germany, some, like Cornelius, relinquishing their tenets, but Overbeck remained at Rome, faithful to the end. Their art is characterized by a certain naïveté, and is technically very primitive.

The name is much more widely applied to the school which arose in England about the middle of the nineteenth century, and accomplished great results both in art and literature. The movement originated with a band of seven young men—Dante Gabriel Rossetti and his brother William Michael, John Everett Millais, William Holman Hunt, Frederick George Stephens, James Collinson, and Thomas Woolner the sculptor. The Brotherhood was formed in the autumn of 1848, and its work really began with "The Eve of Saint Agnes," a picture by Holman Hunt, who was the first of them to realize the purity of work in the early Italian painters and to seek to rival their sincerity, though they owed much to the influence of an older man, Ford Madox Brown. For a time in 1850 they published a periodical called *The Germ*, in which some of Rossetti's earliest poetical work and his fine prose study "Hand and Soul" first appeared. Like the German school, they were convinced that modern traditions had led painters away from the only true principle and the only worthy practice of their art, and that it was necessary to go back for inspiration to the work of the time when art had not ceased to be simple, sincere, and religious. Both in literature and in art, they wished to revert (in Mr. Watts-Dunton's phrase) from "the temper of imitation, prosaic acceptance, pseudo-classicism, and domestic materialism" to that of "wonder, reverence, and awe." Their official manifesto in *The Germ* declares their intention "to encourage and enforce an entire adherence to the simplicity of nature, either in art or poetry." They were defended and warmly praised by Ruskin, who found in their art the modern incarnation of his theories; but by others they were held to have recurred "to a style of painting unadapted to our age, to an ignorance of technical knowledge, and to a religious feeling that could not be voluntarily recalled in a period of different tendencies."

A closer adherence to form followed in the work that felt the influence of the movement. In seeking truth of detail the ensemble was often lost; religious and mystic tendencies occasionally degenerated into affectation which presented an easy mark for caricature. Millais began to break away from the Brotherhood between 1855 and 1857, but Hunt remained faithful, and Burne-Jones's work throughout showed a strong sympathy with the school. In his later life Rossetti threw off the trammels of the narrower Pre-Raphaelitism, while adhering to the mystical attitude. In poetry, the movement may really be considered as a recurrent phase of the wider Romantic movement, whose teaching had been somewhat obscured in the half-century since its proclamation in England. In its looking back to the Middle Ages, it harmonized with the Oxford Movement of its own day, and with the Gothic

revival of Pugin. Its mental attitude is magnificently represented in the highly colored, imaginative 'painter's poetry' of Rossetti and in much of the work of William Morris and some of Swinburne's.

PRERAU, prä'rou. A town of Moravia, Austria, situated 40 miles northeast of Brünn (Map: Austria, E 2). It contains an ancient castle, a Gothic town-hall, a Bohemian college, an agricultural and a trade school. There are considerable manufactures of textiles, also of sugar, hardware and agricultural machinery. Prerau was formerly the chief seat of the Moravian Brethren. Population, in 1890, 12,955; in 1900, 16,727.

PREROGATIVE. In law, a term most frequently employed to describe the rights and privileges of a sovereign or other person in a high official position. It implies an authority or right in the sovereign, not controlled by any other power. For example, the right to *treasure trove* (q.v.) is a royal prerogative, the King having a superior right to any of his subjects. Certain franchises are said to be 'branches' of royal prerogatives granted to subjects. The term is sometimes employed in the United States to denote the authority vested in a public official, but not in the same sense as it is used in the English law. See Pollock & Maitland's *HISTORY OF THE ENGLISH LAW*; Blackstone's *COMMENTARIES*.

PRESBYOPIA. See SIGHT, DEFECTS OF.

PRESBYTER (Lat. *presbyter*, from Gk. *πρεσβύτερος*, *presbyteros*, comp. of *πρεσβύς*, *presbys*, old). In the most general meaning, one advanced in years or rank. The term was used by the Jews to designate the chief official of the synagogue or a member of the Sanhedrin, and was naturally adopted in the Christian Church. For different views as to the institution and duties of the office, see BISHOP; ELDER; ORDERS, HOLY; PRESBYTERIANISM.

PRESBYTERIANISM AND THE PRESBYTERIAN CHURCHES. Presbyterianism is a system of Church government by presbyters, or elders. This fact distinguishes it from other forms of Church government, the papal, the episcopal, and the congregational. "In the presbyterian system all ecclesiastical authority is in the body of presbyters called by Christ, and ordained by presbyters to rule over the Church. . . . The Presbyterian churches exalt the Scriptures above the Church, and urge that Christian men and Christian assemblies should wait upon God, and listen for the voice of His Spirit speaking infallibly in his Word." Calvin has been regarded as the founder of Presbyterianism, and it is true that he was the first to organize the Reformed Church on a Presbyterian model; but it should be remembered that government by a

body of elders was maintained by the Waldensians and others from a much earlier age.

The name being derived from the form of Church government, the term Presbyterian properly includes all those who accept the presbyterian government, even though there may be differences in their theological beliefs. So in the general Presbyterian Council held at Edinburgh in 1877, the German State establishments and the French and Dutch Reformed churches were represented. Presbyterians are generally Calvinistic in doctrine, and for the most part accept the Westminster Assembly's Confession of Faith and the Larger and Shorter Catechisms as the symbols of belief. They do not, however, all agree in the interpretation of those standards.

PRESBYTERIAN POLITY rests on representative government and an ascending series of appellate courts. There are three classes of officers in every well-organized church—the minister or pastor, who is also called a teaching elder; the body of ruling elders, who, with the pastor, have the spiritual oversight of the church; and the deacons, who have care of the relief of the poor and in some churches manage also the financial affairs. The primary governing body is the church session, which consists of a pastor and the ruling elders, chosen by the congregation. Elders were formerly chosen only for life, but now in some branches of the Church hold office for a term of years. The church session is under the control of the presbytery to which it belongs. The presbytery consists of the pastors and churches of a given district. The presbyteries are united in a larger governing body called the synod. The larger synods of the United States are representative bodies consisting of ministers and elders chosen from the presbyteries according to some definite ratio. The smaller synods are undelegated bodies, all the ministers and one elder from each church constituting the body. In some of the smaller branches of the Church the synod is the ultimate court. The completed system, however, includes a General Assembly, which is the supreme court. It meets annually and consists of ministers and elders chosen by the respective presbyteries in some definite ratio. Appeals and complaints are carried from the lower to the higher judicatory, beginning with the session and terminating with the General Assembly. In the Presbyterian Church in the United States appeals from the synods to the General Assembly are limited to cases involving doctrine or government. In the other Presbyterian churches appeals from the synods to the Assembly are allowed in all cases. The Assembly also has general jurisdiction over the various agencies of the Church, such as the theological seminaries and the boards doing the benevolent and missionary work.

THE PRESBYTERIAN CHURCHES IN SCOTLAND. Christianity was probably introduced into Scotland about the beginning of the third century, and the claim has been made that the early Celtic churches were non-prelatical. However that may be, they were later brought into the Roman obedience, and remained thus until the Reformation. Since that time the history of the Presbyterian Church in Scotland has been practically a history of the country. The life of John Knox (q.v.) is the epitome of the Scottish Reformation. The first public movement toward the organization of the Presbyterian Church was the drawing of a bond known as "The First Covenant."

It was signed at Edinburgh, December 3, 1557, by some of the most powerful Scotch barons, and by many of the lesser nobility. This act brought forth a proclamation from the Queen Regent forbidding any one to preach or administer the sacrament without the authority of a bishop, but the Reformed party triumphed and in 1560 Parliament abolished the Roman Catholic form of worship, adopted a confession of faith agreeing with those of the Reformed churches of the Continent, and appointed ministers of the Protestant faith to various parts of the kingdom. On December 20, 1560, the first General Assembly of the Church of Scotland was held in Edinburgh. It consisted of six ministers and thirty-four laymen. In this same year a committee of five persons, including Knox, had been appointed "to commit to writing their judgments touching the reformation of religion." Their *First Book of Discipline* was rejected by the nobles, though accepted by the Church. In 1581 the *Second Book of Discipline* was adopted by the Assembly, and is still in force together with the Westminster standards. The undaunted perseverance of John Knox and Andrew Melville at last procured complete recognition of the Calvinistic faith, and the Presbyterian form of government, as the established religion of Scotland. This was ratified by Parliament, with the consent of King James (I. of England, and VI. of Scotland) in 1592. His duplicity, however, soon made itself manifest when he tried to force the episcopal polity on his Scottish subjects. In this he was followed by his successors, Charles I., Charles II., and James II. The ecclesiastical affairs of the country were in great confusion. In 1610 the Glasgow Assembly restored the episcopal government. In 1638 the Assembly rescinded the acts of six previous Assemblies, condemned and deposed the bishops, and abolished episcopacy. In 1661 Parliament passed the Rescissory Act, which repealed the legislation of the previous twenty-one years, and episcopacy was restored to its former position. After the accession of William and Mary in 1689 civil and religious liberty were restored and Presbyterianism was revived. In 1690 an Act of Settlement was passed, prelacy done away with, and the Westminster Confession adopted. Though both England and Scotland had been under one crown for nearly a century, they still continued separate kingdoms, each with its own Parliament and executive, independent of the other, but upon their union in 1707 the position of Presbyterianism was guaranteed, and it has since continued to be the established religion of Scotland. The Church of Scotland is the established Church, from which the other bodies have from time to time withdrawn. It differs from them chiefly in maintaining a connection with the State.

The question of patronage caused great dissension at an early period, for the Scotch claimed the right to elect their own clergy, or at least the privilege of vetoing an unsatisfactory appointment. A worldly spirit manifested itself, men who were lax in principle obtained important positions, and strange doctrines were taught: the result was the secession of several important bodies. The first party to withdraw were the *Covenanters* or *Cameronians*, who objected to the interference of State with Church, and who therefore on July 27, 1712, renewed the Covenants

(q.v.). They were lineal descendants of the covenanted presbytery, and logically true to their principles. The former Covenanters protested against the errors of prelacy, and their successors were now equally emphatic against the backsliding of presbytery. Another body led by Ebenezer Erskine (q.v.) came out in 1733, forming a party known as the *Associated Presbytery* or *The Seceders*. Again, in 1760, another body left the mother Church. These men were known as *The Relief Synod*. On May 13, 1847, these churches united, forming the *United Presbyterian Church of Scotland*.

The Free Church of Scotland originated in a protest against civil patronage of the Church, the civil courts claiming not only the right to control the temporalities of the Church, but also the power to rule in spiritual affairs. In 1834 the General Assembly passed the 'Veto Act,' under which the Church courts might reject a 'presentee' of the State, if by them deemed unfit for his office. This act was annulled by the civil courts and the House of Lords in 1839. The Assembly could not agree thus to surrender what it believed to be a right bestowed by the head of the Church. The collision between the civil and ecclesiastical courts was so direct that those who held to the independence of the Church saw only one way of relief, which was to leave the established Church. Therefore, in 1843, 470 members, under the lead of Chalmers, Candlish (qq.v.), and others, signed an "Act of Separation, and Deed of Demission," and the Free Church of Scotland was the result. It renounced all benefits of establishment, but expressed its firm adherence to the doctrine and maintained the forms of worship and discipline of the Church of Scotland.

The United Free Church of Scotland was the result of a movement toward union between the two great bodies which had left the established Church. On October 31, 1900, a Uniting Act was formally adopted by the Free Church Assembly and the United Presbyterian Synod sitting in Edinburgh. On the following day the ministers of the two churches, some 3000 in number, marched in procession from their respective halls to Waverly Market, where they convened as the first General Assembly of the United Free Church. Principal Rainy was the first moderator. The new Church received from the United Presbyterian Church 637 ministers and 199,089 communicants; from the Free Church, 1149 ministers and 296,089 communicants. A minority of 27 ministers and 500 elders voted against the union, and resolved to continue the Free Church.

The Reformed Church of Scotland, descended from the Covenanted Church, glories in its adherence to the principles for which Cameron, Renwick, and Cargill shed their blood. In 1660 the Act of Supremacy was passed, which constituted the King supreme judge in all matters, civil or ecclesiastic; and the oath of allegiance, which declared it to be treason to deny the supremacy of the King in Church and State, was imposed. The Covenanters asserted their belief in the covenants, and renounced their allegiance to the King on the ground that he had broken his vow, made at his coronation, and had forfeited his right to rule. As a matter of course persecution followed, the leaders perished on the scaffold, and the people were left without a head. They resolved themselves into

societies for worship and mutual edification. This caused them to be called the 'Society People,' though they spoke of themselves as the 'Persecuted Remnant.' Later the spirit of compromise entered the Church, and in the desire to comply with the King's wish to include as many as possible of the prelatic clergy, the Church received a large number of the very men who had been most earnest in its persecution under the old régime. The 'Society People' could not approve of the conduct of either King or Church, and it was therefore impossible for them to identify themselves with the Established Church. For lack of sufficient number of ministers, the first presbytery of this people was not formed till August 1, 1743; but from this time the Reformed Presbyterian Church went steadily forward, adhering to its peculiar principles with great firmness of purpose, increasing, indeed, with such rapidity that it was for a time beyond its power to supply ministers sufficient for the needs of the people. Later, however, it gradually declined, and nearly all its members joined either the Free or the United Presbyterian Church of Scotland.

THE PRESBYTERIAN CHURCH OF ENGLAND. In England the principles of the Puritans were practically Presbyterian, although they were for the most part more concerned with resistance to power, exercised as they believed against the Word of God, than with the development of Church government. Still the ministers of London and its vicinity organized a presbytery at Wandsworth, in Surrey, in 1572, and other presbyteries followed in spite of the hostility of Queen Elizabeth. In July, 1643, in obedience to a summons from Parliament, the Westminster Assembly met in Westminster Abbey and continued in session until 1647. The documents known as the Confession of Faith, the Form of Church Government, the Directory for Worship, and the Larger and Shorter Catechisms, drawn up by this assembly, were approved by Parliament in 1648. (See CREEDS AND CONFESSIONS.) Parliament in 1647 passed an ordinance making Presbyterianism the established religion of England, but this law never went into practical effect. When Cromwell and the Independents came into power, their influence was thrown against Presbyterianism, partly perhaps because of the resistance of the latter to the trial and execution of Charles I. After the Restoration, by command of Charles II., the Savoy Conference (q.v.) was held at the residence of the Bishop of London in 1661. The purpose was, nominally, to alter and reform the Liturgy in such a way as to meet the feelings of those who had serious scruples against its use. The negotiations were a failure, as the bishops refused to make any changes. This conference was followed by the Act of Uniformity, which took effect August 24, 1662. Two thousand ministers who would not consent to abjure the Solemn League and Covenant, or to be episcopally reordained, resigned their charges or were ejected from them. Sixty thousand church members were imprisoned or fined, five thousand of whom died in prison. After the Revolution and the Act of Toleration in 1689, Presbyterianism flourished again. In 1691 the Presbyterians entered into articles of agreement with the Independents, giving up presbyteries and synods. Arian and Socinian doctrines prevailed to such an extent that the name Pres-

byterian became synonymous in England with Unitarian. In the meantime, there existed in England a few congregations connected with the Scottish Church formerly known as the Secession Church, later as the United Presbyterian Church. At the formation of the Free Church of Scotland, the greater number of the English churches connected with the Church of Scotland espoused the cause of the Free Church, and took the name of the *Presbyterian Church of England*. On June 18, 1876, the first synod of the Presbyterian Church of England was constituted by the union of the Presbyterian Church and the United Presbyterian. The united Church has grown from 263 congregations, in 1876, to 311 in 1900. They carry on an extensive home and foreign missionary work.

THE IRISH CHURCH. The history of Presbyterianism in Scotland is also essentially its history in Ireland. The first presbytery in Ireland was organized in 1642 by Scotch chaplains accompanying the army sent there to subdue the 'Great Rebellion' of that period. The Presbyterian population increased by immigration from Scotland. Early in the eighteenth century doctrinal differences began to appear, and in 1726 a schism took place. Those who would not subscribe to the Westminster Confession formed themselves into the *Presbytery of Antrim*. The orthodox body was called the *Synod of Ulster*. Scotch Seceders, coming over in the middle of the eighteenth century, did much to maintain purity of doctrine in the northern provinces. Owing to laxity of doctrine in the Irish Church, the Covenanters made steady progress, and in 1792 their first Irish presbytery was formed. In 1835 the Synod of Ulster endeavored to stem the tide of lax doctrine by requiring subscription to the Confession of Faith. The grounds of separation between them and the Seceders being thus removed, a union was happily consummated in 1840. The General Assembly of the Presbyterian Church of Ireland consisted at its organization of 433 congregations. It has steadily increased and now numbers nearly seven hundred ministers, with more than one hundred thousand communicants.

The Presbyterian Synod of Seceders in Ireland was formed in 1818 by a union between the two sections of the Scottish Secession Church in Ireland, the Burghers and the Anti-Burghers. The division arose in Scotland in 1747 in regard to the propriety of an oath administered to the burghesses which pledged the taker to support "the true religion presently professed within the realm and authorized by the laws thereof." Those who defended the taking of the oath were called the Burghers; those who condemned it the Anti-Burghers. This controversy spread to Ireland. At the time of the union of these two bodies there were 97 ministers. In 1840 the Synod of Seceders united with the Synod of Ulster, taking the title of the *Presbyterian Church in Ireland*.

THE CALVINISTIC METHODIST OR PRESBYTERIAN CHURCH OF WALES has been Calvinistic in its doctrine from its beginning. In 1735-36 Howell Harris, Howell Davis, and Daniel Rowlands began to preach in different parts of Wales. Whitefield heard of them and worked with them, and for a short time the Calvinistic Methodists of Wales were associated with the Methodists of England, but after 1748 Whitefield ceased to act

as their head and their connection with England was gradually broken off. In 1811 they held a General Synod at Bala, when 21 persons were ordained to the ministry. In 1864 the churches of North and South Wales came under the control of one General Assembly. In this Church every elder is a member of presbytery. In 1901 it reported 158,114 members, with total collections of \$1,419,515. There is a branch of this Church in the United States, with 186 congregations and 108 ministers.

THE PRESBYTERIAN CHURCH OF THE BRITISH COLONIES. In Canada the Presbyterian Church dates from the Conquest in 1759. Its first preacher is supposed to have been the Rev. George Henry, chaplain of a British regiment stationed in Quebec. In Montreal the first Presbyterian church was organized in 1790. In Upper Canada the pioneers of Presbyterianism were from the Reformed Dutch Church. One of the earliest missionaries was the Rev. Robert McDowell, who was sent by the Classis of Albany in 1798. Other ministers were sent from Scotland, and later, with immigrants from Scotland and the north of Ireland, Presbyterianism took firm root in Canada. In 1831 *The Synod of the Presbyterian Church of Canada* was formed in connection with the Church of Scotland. It consisted of 25 ministers. The Secession Church of Scotland was also represented, and was known as the *Synod of the United Presbyterian Church in Canada*. In 1844, after the disruption in Scotland, a division took place in the Presbyterian Church in Canada, and 25 ministers withdrew, calling themselves the *Presbyterian Church of Scotland*. In 1861 this body and the United Presbyterian Church in Canada united under the name of the *Canada Presbyterian Church*, with a roll-call of 226 ministers. The same churches in the lower provinces also united as the *Presbyterian Church of the Lower Provinces*. After the confederation of the provinces which now form the Dominion of Canada, there arose a natural desire for an ecclesiastical union which had long been contemplated. Negotiations were begun in 1870, and the union was happily brought about June 15, 1875, in the city of Montreal, the Church thus united numbering 634 ministers and 90,658 communicants.

There are also Presbyterian churches in all of the other colonies. The *Australian Presbyterian Church* was founded while that country was still a penal colony. In 1836 the first Presbyterian minister was there in the person of Rev. Mr. Clow, a retired chaplain of a Highland regiment. The representatives of the different forms of Presbyterianism united in 1867 on the abolition of State aid. There were in 1900 six Assemblies or General Synods in Australia and Tasmania, comprising about 1000 ministers and 55,000 communicants, with total contributions to all purposes of about \$980,000. In August, 1901, the Presbyterian churches of Australia united and signed the deed in Sydney, the Rev. Dr. Meiklejohn being the first moderator of the new body.

The New Zealand Presbyterian Church was founded about the year 1840. In 1900 it comprised two assemblies—the Otago and the Southland—with 201 ministers and about 26,000 communicants, and its contributions were about \$310,000. On October 31, 1901, these two bodies united and now form the Presbyterian Church

of New Zealand. The first united Assembly was held in Dunedin and the Rev. James Gibbe was made moderator.

The *Presbyterian Church of South Africa* comprises three branches: The General Assembly of the Presbyterian Church of South Africa, the Synod of the Free Church Mission of Kaffraria, the Synod of the Presbyterian Church of Basuto Land. They had in 1900 71 ministers and about 18,000 communicants, and raised about \$73,000.

The *Presbyterian Church of Jamaica* numbers 30 ministers and about 12,000 communicants, and contributes about \$340,000.

THE PRESBYTERIAN CHURCH IN THE UNITED STATES was founded by the Scotch, Irish, French, German, and Dutch Reformed immigrants to this country. Fugitives from persecution, they took refuge in the more liberal colonies of Pennsylvania, Maryland, New Jersey, Virginia, and the Carolinas, and some in New England. The founding of a Presbyterian colony on Massachusetts Bay took place in 1625. With the arrival of more colonists in 1629 a church was fully constituted under the Rev. Samuel Skelton. Christ's Presbyterian Church was established at Hempstead, Long Island, in 1644. The Rev. Francis Doughty, an English Presbyterian minister, was the first Presbyterian to preach in New York. He ministered there from 1643 to 1648. A Presbyterian Church, however, was not organized until 1717. Francis Makemie, an Irish minister of the Presbytery of Laggan, is considered the father of organized Presbyterianism in America. He founded several churches in Maryland and Virginia. Later he crossed the ocean to appeal to the mother Church for help. In 1707 he was imprisoned in New York for preaching without permission, for at that time the Episcopal Church was practically the established Church, and no dissenter was allowed to preach without a license. In the meantime other Presbyterian churches had been founded, one in Freehold, N. J., in 1692, one in Philadelphia, in 1698, under the care of Jedediah Andrews. The first American presbytery was organized in Philadelphia, probably in 1706—the precise date having been lost—and consisted of seven ministers, Francis Makemie, Samuel Davis, John Hampton, and George McNish, from Ireland; Nathaniel Taylor and John Wilson, from Scotland; and Jedediah Andrews, from New England. The growth of the Church was rapid, and in 1716 the Synod of Philadelphia was formed, consisting of four presbyteries: Philadelphia, with six ministers and churches; New Castle, six ministers and churches; Snow Hill, three ministers and churches; Long Island, two ministers and several churches. There is no record at this time that any standards of doctrine had been adopted by the Synod, although as most of the ministers were of Scotch descent, it is probable that the Westminster standards were those to which the young Church adhered. In 1729, by an 'adopting act,' the Synod made the Westminster Confession of Faith their doctrinal standard, "as being in all the essential and necessary articles good forms of sound words and system of Christian doctrine." They also agreed that no one should be ordained to the ministry or received into membership who had scruples as to the Confession, "save only about articles not essential and necessary to doctrine, worship, and government." The ministers from abroad, however, were more

strict in their doctrinal ideas, and laid more stress on scholarship, than the native ministers, who insisted more on a living Christian experience, and who, in view of the great needs of the new country, were disposed to receive into the ministry students who were sound in doctrine, but whose opportunities for education had been limited. In 1739 party feelings were stirred by the visit of George Whitefield, and the Synod was divided into a party warmly befriending revivals and a party standing aloof from that form of work. By 1741 this dissension resulted in a schism and two Synods were formed: the *Old Side*, called the *Synod of Philadelphia*, insisting on a thoroughly educated ministry; the *New Side*, or *Synod of New York*, which laid more stress on piety and zeal. There was but slight difference between the two bodies as to doctrine or discipline. After a separation of thirteen years this breach was healed and the two Synods united under the title of the *Synod of New York and Philadelphia*, with more than 100 churches under its care.

At this time the tide of population was flowing rapidly westward. The frontier communities contained many men of lawless habits. Hostile Indians were numerous. The opposition of the State Church added to the difficulties of the Presbyterian pioneer. Men of education and strength of character were needed. The Church found them in the Tennents of New Jersey, Brainerd, the missionary to the Indians, Davies, of Virginia, and many others whose work still lives in the Christian communities they established. In 1766, fearful of the legal establishment of the Church of England, the Synod agreed to meet in annual convention with the General Assembly of Connecticut "to unite their endeavors and counsels for spreading the Gospel and preserving the religious liberties of the Church." This arrangement was continued till the war of 1776.

During all the struggle of the United States for independence the Presbyterians stood as one man for the defense of the civil and religious liberty of the country. John Witherspoon, one of its most prominent ministers, was a signer of the Declaration of Independence, and before Congress made one of the most effective pleas for the liberty of our country. Although during the Revolutionary War many buildings were destroyed and congregations disbanded, still the vitality of the Church continued, and when peace was restored it grew so rapidly that the need of a General Assembly became evident. In 1785 a large committee was appointed to consider a form of complete organization for the Presbyterian Church in the United States. In May, 1788, the Synod met and resolved itself into a General Assembly, which held its first meeting in Philadelphia the following year. The first Congress of the country was in session in New York at the same time. The first General Assembly embraced 4 synods (New York and New Jersey, Philadelphia, Virginia, and the Carolinas), 17 presbyteries, 419 congregations, and 180 ministers. This Assembly adopted the Westminster Confession of Faith after making changes in chapters 20, 23, and 31, and the Larger and Shorter Catechisms. The form of government of the Scottish Church was also adopted, but modified so as to deny to the civil magistrate any right of interference in Church affairs, except for protection only.

In 1801 a plan of union was agreed upon between the Presbyterian Church and the Connecticut General Association which provided terms for mutual help in the weaker communities. Presbyterian ministers might serve Congregational churches and vice versa.

The Presbyterian Church, at the time of the union, numbered 26 presbyteries, 300 ministers, and nearly 500 congregations. Early in the century there were many revivals, especially in the southwestern part of the country, which brought into service many as catechists and exhorters who were neither highly educated nor firm believers in the peculiar doctrines of the Presbyterian Church. The controversy over these questions brought about the secession of the Presbytery of Cumberland, and resulted in 1810 in the formation of the Cumberland Presbyterian Church (see below). The beginning of the nineteenth century showed increased zeal on the part of the Presbyterian Church for missionary enterprise. Within a few years, in New York, Pennsylvania, and New England, missionary societies were formed to send the Gospel to the Indians and among the pioneers. In 1802 the General Assembly organized a 'Standing Committee of Missions' consisting of 7 members, later increased to 19 members, whose duty it should be "to collect during the recess of the Assembly all the information in their power relative to the concerns of missions and missionaries," and to "superintend generally under the direction of the Assembly the missionary business." In 1816 the title of the committee was changed to Board of Missions, and it was authorized to act with a larger measure of independence. The growth of the Church was rapid. In 1834 it contained 32 synods, 111 presbyteries, and about 1900 ministers. At this time signs of the future schism which divided the Church for so many years into the 'Old' and 'New' schools became apparent. For some time there had existed a diversity of doctrinal beliefs among the ministers and churches. New doctrines, coming largely from New England, were adopted by the members of the New School party. In the Old School branch there was a leaning to the strict doctrine and discipline of the Scotch Church; Albert Barnes (q.v.), of Philadelphia, and Lyman Beecher (q.v.), of Lane Seminary in Cincinnati, were both subjected to trial and censure by their presbyteries. The Church was shaken by the controversy. The agitation over slavery divided it still further. The New School party felt called upon to denounce it, while the Old School thought that duty did not require that the Church should pronounce on the subject. In 1837 the Assembly, having (for the first time in five years) a majority of Old School members, disowned or excised three of the synods of western New York and one in Ohio, with all the churches and ministers belonging to them. Great excitement prevailed throughout the Church. A meeting of the excluded synods was held at Auburn, New York, in August, 1837, as the true constitutional Assembly, at which trustees were appointed for the care of the property of the corporation. These trustees later brought legal action to determine their rights, and a verdict was given in their favor, but on appeal to a higher court the decision was overruled on points of law, and a new trial granted. The matter was not pressed further. In 1838 the New School members demanded

enrollment for the excluded commissioners of the preceding year. This was refused and the bodies separated, each claiming to have the constitutional succession, and using the title the General Assembly of the Presbyterian Church in the United States of America. The Old School Church had seminaries at Princeton, N. J.; Allegheny, Pa.; Columbia, S. C.; Danville, Ky., and Chicago. The New School seminaries were Union, N. Y.; Auburn, N. Y.; Lane, at Cincinnati; and Blackburn, Ill. Each Church carried on its work with great zeal, both at home and abroad; each branch was active in encouraging educational institutions, and as they flourished side by side, each grew more confident of the orthodoxy and usefulness of the other. The Old School Assembly of 1837 had organized its Board of Foreign Missions, and it continued to support the Boards of Home Missions and of Education which had been organized before the division. The New School carried on its home mission work through the American Home Missionary Society. Later, however, it organized permanent committees on Home Missions, Education, and Publication, through which its work was carried on, while its foreign work was conducted through the American Board of Commissioners for Foreign Missions.

But now signs of the approaching national storm began to appear. In 1858 the southern part of the New School Church, dropped off and organized under the title of the *United Synod of the Presbyterian Church, South*. A hundred ministers and 200 churches constituted this synod, which remained a separate organization until 1864, when it joined the General Assembly of the Southern Presbyterian Church. In 1861 the Old School branch suffered a similar defection, as the Assembly of that year took action which grieved the Southern commissioners, who withdrew and organized the *Southern Presbyterian Church* (see below). With the abolition of slavery and the close of the Civil War a new spirit arose in the two branches of the Church in the North. The New School has proved its soundness in the faith, and the inheritance of a common ancestry asserted itself. In 1866 the two Assemblies met in Saint Louis, and for the first time in a generation partook of the Lord's Supper together. A committee was appointed to consider plans for union, these plans were submitted to the various presbyteries, and in 1869 the two Assemblies met and paved the way for the union which was consummated in November, 1869, in Pittsburg. The next year both Assemblies met in the First Church of Philadelphia as one body. At this time the ministers numbered 4238, the churches 4526, and the members 446,561. In 1888 the General Assembly celebrated in the city of Philadelphia the first century of its organization. In 1788, at the time of the first Assembly, there were but 419 churches and not more than 20,000 communicants. At the centennial there were 6436 churches reported, and about 700,000 communicants.

In 1889 the General Assembly received overtures from a number of presbyteries asking for some revision of the doctrinal standards. In reply that Assembly sent overtures to all the presbyteries asking whether revision were desired, and to what extent. About two-thirds of the presbyteries expressed a desire for revision, and the Assembly of 1890 appointed a committee on re-

vision, consisting of 15 ministers and 10 ruling elders. This committee presented a report in 1892 recommending sundry changes in the Confession of Faith. This report was sent to the presbyteries, affirmative votes from two-thirds of the presbyteries being needed to secure the adoption of the submitted changes. During this discussion the Church was agitated by the trial of Prof. Charles A. Briggs of Union Theological Seminary on the charge of heresy. This so unsettled the mind of the Church that many who under ordinary circumstances would have voted for revision believed it an inopportune time to subject the standards to discussion or change. The overtures from the Assembly therefore failed of the constitutional majority and revision was for the time abandoned. The demand for some modification of the Confession continued, however, and by 1900 had become so general that the Assembly of that year appointed another committee of 15 to consider the whole question of a restatement of doctrine. It reported progress in 1901, was enlarged and continued with instructions to report the next year. At the Assembly of 1902 in the city of New York a unanimous report was made. The committee recommended that additional statements concerning the love of God for all men, missions, and the Holy Spirit be added in the form of new chapters to the Confession of Faith. It recommended a declaratory statement in reference to chapter iii. and chapter x., section 3; and textual modifications in chapter xvi., section 7; chapter xxii., section 3; chapter xxv., section 6. These by direction of the General Assembly were transmitted to the presbyteries for their action—report to be made to the Assembly of 1903. The committee also presented a brief statement of the Reformed Faith in 16 articles which was designed not to take the place of the Confession of Faith as a doctrinal standard of the Presbyterian Church, but to be an interpretation of it. This "Brief Statement of the Reformed Faith" was adopted with only two dissenting voices. It relates to the principal subjects of the Reformed Faith such as the Being of God, revelation, the eternal purpose, the creation, the sin of man, the grace of God, election, the Holy Spirit, the resurrection, and the life to come, the Church and the sacraments, the last judgment, and Christian service.

The great national expansion following the war with Spain in 1898 gave a marked advance to the missionary operations of the Church. The field of home missions, which already extended to Alaska, was widened to include Porto Rico, and, later, Cuba, while in the Pacific the Philippine Islands were added to the vast foreign missionary territory.

The Presbyterian Church has also been true to her historic devotion to education, secular and sacred. Presbyterian academies and colleges are found in all the States and Territories, while 13 theological seminaries under the care of the Assembly provide for the Church an educated ministry. They are as follows: Princeton Theological Seminary, at Princeton, N. J. (founded 1812); Auburn Theological Seminary, at Auburn, N. Y. (1820); Western Theological Seminary, at Allegheny, Pa. (1827); Lane Theological Seminary, at Cincinnati (1832); Union Theological Seminary, New York (1836); McCormick Theological Seminary, at Chicago (under General As-

sembly 1859); Danville Theological Seminary, at Danville, Ky. (1859); San Francisco Theological Seminary, at San Anselmo, Cal. (1871); the Theological Seminary at Omaha, Neb. (1891); and two German theological seminaries, at Bloomfield, N. J. (1869), and at Dubuque, Iowa (1852). There is also a theological department in connection with Biddle University for Freedmen, established in 1868, and with Lincoln University at Oxford, Pa., established in 1871; both of these are supplying ministers for the colored population. For further details, see the separate articles on the more important of the institutions named above.

THE PRESBYTERIAN CHURCH IN THE UNITED STATES. In May, 1861, the General Assembly, meeting in Philadelphia, adopted a paper in reference to the Civil War, which asserted the loyalty of the Church to the Union and promised the support of all its churches and ministers to the Federal Government. The Southern Presbyterians, feeling that the Church had exceeded her rights in pronouncing on a political question, "concluded that a separation from the General Assembly aforesaid was imperatively demanded. Not in the spirit of schism, but for the sake of peace and for the protection of the liberty with which Christ had made them free." Accordingly the representatives of 47 presbyteries commissioned for that purpose met in Augusta, Ga., on December 4, 1861, and organized a new Assembly, designated as the *Presbyterian Church in the Confederate States of America*. After the war, however, the word *United* was substituted for *Confederate*, and of *America* was dropped. The Southern Presbyterian Church disavows all connection with political matters, and emphasises its purely ecclesiastical mission. The words of the Rev. Dr. B. M. Palmer, in 1886, voice the sentiment of the Church: "The simple fact remains that we were separated from the Church of our fathers upon a strictly political issue, which a spiritual court had no authority, either human or divine, to adjudicate. Whether we ourselves fully comprehended or not the significance of our withdrawal, the logic of the case constituted us the asserters and guardians of this vital truth, the non-secular and non-political character of the Church of Jesus Christ, and whether we will or no, we must preach to the world this Gospel of the Kingdom." At the time of its organization the Southern Church included 10 synods, 47 presbyteries, about 700 ministers, and 75,000 communicants, of whom 10,000 were of the African race. The missionary work of the Church is conducted by permanent committees, and is carried on in many foreign lands, as well as in our own country. The interests of Publication and Colored Evangelization are also conducted by efficient committees. The standards of the Church are: The Westminster Confession of Faith, the Larger and Shorter Catechisms, the Form of Government and Directory for Worship, somewhat altered to suit the circumstances of the Church. Every Church officer is required to adopt them.

This Church has theological seminaries at Richmond, Va. (Union Theological Seminary), and Columbia, S. C. (Columbia Theological Seminary). The seminary at Louisville and Danville Seminary have been united and the seminary is now at Louisville, Ky. There are also theological departments in connection with the University of

Texas and the Southwestern Presbyterian University at Clarksville, Tenn.

THE CUMBERLAND PRESBYTERIAN CHURCH was organized in Tennessee on February 14, 1810, by three Presbyterian ministers, Finis Ewing, Samuel King, and Samuel McAdow. They called the organization the Cumberland Presbytery. This act was the crisis of a movement begun a dozen years earlier, the great spiritual revival which had stirred that part of the Southwest, under the leadership of James McGready and others. This revival was widespread, and its converts were so many that the demand for ministers was far in excess of the number the Church could furnish. Under the advice of some of the most honored ministers of the time, men of approved intelligence and religious character were chosen as exhorters, even though they had not had the education usual to candidates for the ministry. The urgency of the need seemed to the Revival Party a sufficient reason for the custom. The men so ordained were permitted to adopt the Westminster Confession of Faith with the exception of 'the idea of fatality.' The controversy along these two lines increased till it resulted in the formation of the new Church. In 1813 the Cumberland Presbytery had so increased as to make necessary its division into three presbyteries and the formation of a synod. One of its first acts was to appoint a committee to prepare a Confession of Faith. This committee simply modified the Westminster Confession, the chief changes being in chapters iii. and x. The Presbyterian polity was retained. Before the Civil War there were about 20,000 colored Cumberland Presbyterians worshipping with the white congregations. In 1869, however, the colored people asked and received consent of the General Assembly to the organization of the African Cumberland Presbyterian Church. The Cumberland Presbyterian Church has a theological seminary at Lebanon, Tenn.

THE UNITED PRESBYTERIAN CHURCH OF NORTH AMERICA was organized in Pittsburg, Pa., on May 26, 1858, by a union of the Associate and the Associate Reformed churches. By one line the United Presbyterian Church is descended from the Covenanters of Scotland, by the other line it is descended from a body of men who were imbued with the ideas which later brought forth the Free Church of Scotland. The basis of the union was the Westminster Standards together with a 'Testimony.' The Testimony consists of 18 articles designed to set forth the views of the Church on "certain points not distinctly introduced into the Confession of Faith." The Church holds to a restricted communion; it has been and still is distinguished by its attitude on the subject of Church psalmody, using only the Psalms for its worship of song. In 1881 the General Assembly by a very small majority repealed the rule

forbidding the use of instrumental music in the worship of God. The United Presbyterian Church has always maintained a high standard for the ministry. As early as 1794 the Associate Church established a theological seminary in Pennsylvania, the first on the Continent. Other seminaries and colleges have been founded. Home and foreign mission work has prospered as well as freedmen's work, publication, and ministerial relief. At the union, in 1858, there were 408 ministers, and the contributions were \$253,150 for all purposes. The United Presbyterian Church has two theological seminaries—one at Allegheny, Pa., founded in 1825, and one at Xenia, Ohio, founded by the Associate Synod in 1794 at Service, Pa., removed to Canonsburg in 1821, and to Xenia, Ohio, in 1825.

THE REFORMED PRESBYTERIAN SYNOD was founded in 1743 by members of the Covenanting or Reformed Presbyterian Church of Scotland. In 1798 a presbytery was organized in Philadelphia. In 1800 it enacted a law that no slaveholder should be a communicant, a position always maintained. Members of this Church neither vote at political elections, enlist in the army, nor serve on juries. In 1833 the questions relating to the extent of severance between Church and State led to the disruption of the Church, the *General Synod of the Reformed Presbyterian Church* being formed of those who, while adhering to the Standards, permitted their members to discharge the duties of citizens. This body has a theological seminary at Philadelphia, founded in 1807. The Reformed Presbyterian Church (Covenanter) has a theological seminary at Allegheny City, Pa.

THE ASSOCIATE REFORMED PRESBYTERIAN SYNOD OF THE SOUTH was organized in 1803 at Brick Church, Fairfield County, South Carolina. Until 1822 it was connected with the General Synod, composed of the Synods of New York and the West. But the General Synod always met in New York, and as the Southern men could so seldom attend, it was decided in 1822 to become an independent synod. The separation was not on account of slavery or sectionalism. It has churches in every Southern State and flourishing mission work in Mexico. Its educational institutions are Erskine College, Erskine Theological Seminary, and Due West Female College, all located at Due West, S. C.

THE ASSOCIATE SYNOD OF NORTH AMERICA is a small body which declined to enter the union which in 1858 constituted the United Presbyterian Church. It has twelve ministers and about a thousand members, and coöperates with the original Seceders of Scotland in mission work in India.

STATISTICS. The following tables give the latest available figures for the different Presbyterian churches:

	Presbyteries	Ministers	Churches	Church members	S. S. pupils	Home work	Foreign work
Pres. Ch. in United States America.....	233	7,617	7,748	1,045,338	1,063,683	\$1,203,453	\$898,079

PRESBYTERY (ML. *presbyterium*, from Gk. *πρεσβυτέριον*, assembly of elders, from *πρεσβύτερος*, *presbyteros*, elder). Generally, the body or class of presbyters or elders in the Christian churches taken collectively. More specifically, in the churches having a Presbyterian form of government, it is one of a series of judicatories, ranking next above the session, the court of a local church, and below the synod (qq.v.). The presbytery as an ecclesiastical judicatory is most completely developed in the Presbyterian Church in the United States of America, where its composition and powers are defined in the Form of Government as follows: "A presbytery consists of all ministers, and one ruling elder for each congregation, within a certain district. The presbytery has power to receive and issue appeals from church sessions, and references brought before them in

an orderly manner; to examine and license candidates for the holy ministry; to ordain, install, remove, and judge ministers; to examine and approve or censure the records of church sessions; to resolve questions of doctrine or discipline seriously or reasonably proposed; to condemn erroneous opinions which injure the purity or peace of the Church; to visit particular churches for the purpose of inquiring into their state and redressing the evils that may have arisen in them; to unite or divide congregations, at the request of the people, or to form and receive new congregations; and in general to order whatever pertains to the spiritual welfare of the churches under their care." Such a presbytery corresponds to a classis in the Reformed churches. The name presbytery is also commonly applied in the Roman Catholic Church to the pastoral residence of the priest or priests of a parish.

PRESBYTERY. The space in the choir of a church in which the high altar is placed; the name is sometimes extended to the whole choir, but is usually applied to the part inclosed in mediæval churches by the choir-stalls.

PRESCOTT. A city, formerly the capital of the Territory of Arizona, and the county-seat of Yavapai County, 137 miles north of Phoenix; on the Santa Fe, Prescott and Phenix Railroad (Map: Arizona, B 2). The city is situated at an elevation of over 5000 feet, in a rich gold, copper, and silver mining country. The industries include stock-raising and lumbering. There is a public library. Population, in 1890, 1,759; in 1900, 3,559.

PRESCOTT, ALBERT BENJAMIN (1832—). An American chemist, born in Hastings, N. Y. He studied medicine at the University of Michigan, and was made dean of the school of pharmacy there in 1876 and director of the chemical laboratory in 1884. He wrote *Qualitative Chemical Analysis* (1874), *Outlines of Proximate Organic Analysis* (1875), *First Book of Qualitative Chemistry* (1879), *Manual of Organic Analysis* (1888), *Periodides* (1896), and *Assay of Alkaloidal Drugs* (1899).

PRESCOTT, GEORGE BARTLETT (1830-94). An American electrician, born at Kingston, N. H. He learned telegraphy soon after the system had been put into practical use, and by 1858 had become superintendent of the lines of the American Telegraph Company. In 1866 he was given the same position in the Western Union Company; from 1873 until 1880 was electrician of the International Ocean Telegraph Company; was one of the early promoters of the telephone; and was connected with numerous telegraph and telephone companies. In 1852 he discovered that the aurora borealis is an electric phenomenon, and the discovery, accounts of which he published in the *Boston Journal* and the *Atlantic Monthly*, attracted much attention among scientists. He invented an improvement in telegraph insulators in 1872; with Thomas A. Edison invented and introduced the duplex telegraph and the quadruplex telegraph; and also introduced from Europe the system of sending messages in pneumatic tubes. He published: *History, Theory, and Practice of the Electric Telegraph* (1860); *Electricity and the Electric Telegraph* (1877); *The Speaking Telephone* (1878); *Dynamo-Electricity* (1884); *Bell's Electric Speaking Telephone* (1884); and *The Electric Telephone* (1890).

PRESCOTT, OLIVER (1731-1804). An American soldier; born at Groton, Mass. He graduated at Harvard in 1750, became brigadier-general of militia for the County of Middlesex, and a member of the Board of War in 1776. From 1777 to 1780 he was a member of the Supreme Executive Council of State, in 1779 was made judge of probate for the County of Middlesex, and in 1781 was promoted to the rank of second major-general of State militia. In 1786-87 he took a prominent part in the suppression of Shays's Rebellion.

PRESCOTT, WILLIAM (1726-95). An American soldier, born at Groton, Mass. In 1755 he served with distinction as lieutenant and captain under Wilson in an expedition against Nova Scotia, but at the end of the war declined a commission in the Regular Army offered him by the British general, and retired to his large estate in Pepperell. There he remained until the battle of Lexington, when he organized a regiment of minute men, and marched as its colonel to Cambridge. On June 16th he was ordered to Charlestown, and threw up intrenchments at Breed's Hill, near Bunker Hill. In the next day's battle, during which he is generally considered to have been the patriot commander, he displayed great bravery, and was the last to leave the field. After serving about two years longer, he returned to his farm, but again served as a volunteer for a short time at Saratoga in 1777. He was subsequently a member of the Massachusetts Legislature for several years. Consult Parker, *Colonel William Prescott, the Commander in the Battle of Bunker's Hill* (Boston, 1875).

PRESCOTT, WILLIAM HICKLING (1796-1859). An American historian. He was the son of a distinguished lawyer and statesman and grandson of Col. William Prescott, and was born at Boston, May 4, 1796. He entered Harvard College in 1811, as a sophomore, and graduated in 1814. While there he lost the sight of one eye by an accident, and the other was so affected that he had to pass several months in a darkened room. He partly recovered the sight of it, but he could use it only a little each day and never in any difficult work. He entered his father's law office, but in January, 1815, the injured eye became inflamed and refused to yield to remedies; so it was determined in the autumn that he should seek health by wintering at Saint Michael's and get medical advice in the spring. At the Azores, where he often had to live in a darkened room, he acquired the accomplishment of learning almost by heart long passages which he had thought out and which he meant to have written. Physicians told him that the sight was hopelessly gone from one eye, and that the preservation of the other depended on his health. Prescott now returned to Boston and on May 4, 1820, married Miss Susan Amory. A legal career was, of course, out of the question, but Prescott's family were well off; so his half blindness was not made still more cruel by the trammels of poverty. Having at this time decided to devote himself to literature, he set to work on the study of Murray's *Grammar*, Johnson's *Dictionary*, Blair's *Rhetoric*, and the English classics from Elizabethan times to his own. The reading of Gibbon's autobiography increased his passion for historical writing. In 1820 he contributed to the *North American Review* a review of Byron's *Let-*

ters on Pope. He soon turned to French literature and made a comparison of French and English tragedy; then took up Italian and German, but Ticknor, his friend and biographer, aroused in him a still greater interest in the literature and history of Spain. He had begun the study of Italian literature in 1823. In 1824 he wrote an essay on *Italian Narrative Poetry*, and had thoughts of taking up Roman history, but, in 1826, he chose the Spanish field.

Owing to his bad eyesight, he was obliged to have the aid of readers and secretaries, and for his own writing had recourse to a writing frame designed especially for the blind. After ten years of hard labor, he produced the first results of his research, the *History of the Reign of Ferdinand and Isabella the Catholic* (3 vols., 1838). The work at once gained favor, and was soon translated into French, Spanish, and German. He then spent six years on what is probably his most brilliant work, a *History of the Conquest of Mexico, with a Preliminary View of the Ancient Mexican Civilization, and the Life of the Conqueror, Hernando Cortes* (3 vols., 1843). His third work in the series was the *History of the Conquest of Peru, with a Preliminary View of the Civilization of the Incas* (3 vols., 1847). These greatly added to his reputation. He was made corresponding member of the French Institute, and on his visit to Europe in 1850 was received with honor. In 1855 appeared two volumes of the *History of the Reign of Philip the Second, King of Spain*, and three years later the third volume, but the work was cut short by a stroke of apoplexy which caused Prescott's death. He had, however, added to his series by editing Robertson's *History of the Reign of Charles the Fifth* (3 vols., 1857), adding thereto a supplement embracing the life of the Emperor after his abdication. Aside from his histories, his literary work consists of a preface to Mme. Calderon de la Barca's *Life in Mexico* (2 vols., 1843); *Biographical and Critical Miscellanies* (1845); *A Memoir of the Honorable John Pickering* (1848); and *A Memoir of the Honorable Abbott Lawrence* (1856).

Prescott is eminent in American letters as one of the first and most accomplished of the historians. Slightly younger than Irving and later in acquiring literary reputation, he excelled him in the extent and system with which he treated his work. To him, with Irving in history and romance, Ticknor in Spanish literary research, and Motley, a few years later, in history, belongs the honor of having introduced and made popular to the English-speaking and a good part of the foreign world the story of the Spanish nation. Technically, as an historian, Prescott has been justly criticised for a tendency to color his pictures too highly and to allow his admiration for his heroes to get the better of his judgment; nor is he altogether successful in dealing with political complications. His most serious defect is one for which he cannot fairly be held responsible. American archaeology has been revolutionized since his day by the labors of Morgan, Bandelier, and others, and the more or less romantic and distorted pictures of Mexican and Peruvian development given by the Spanish chroniclers on whom Prescott relied have been corrected. Thus his work needs to be read in the light of modern research and to be corrected at various points, but with the proper

allowance and viewed as literature its high rank seems assured. His style is dignified, refined, and always eminently readable, and his histories have truly become household classics. There is a *Life* by George Ticknor (Boston, 1864; revised, London, 1875). The best edition of Prescott is that by Kirk in 16 vols. (Philadelphia, 1870-74).

PRESCRIPTION (Lat. *prescriptio*, from *prescribere*, to prescribe, from *præ*, before + *scribere*, to write). A formula by which the physician directs the compounding and dispensing of medicines. Prescriptions were formerly written entirely in Latin, the common scientific language; but at the present time and in this country the tendency is to restrict the employment of Latin to the names of the ingredients of the formula, English being used for the directions. Since the botanical or chemical names are the only ones by which vegetable or mineral drugs can be definitely known, Latin is retained for this part of the medical formula. The formal prescription consists of four parts: (1) The *superscription* comprises the name of the patient, date, and the sign R. The latter is an abbreviation of the Latin word *recipe* (take). (2) The *inscription* or body of the formula consists of the names and quantities of the drugs to be compounded. The names of the ingredients, as before stated, are written in abbreviated Latin, and the quantities set down in apothecaries' measure or according to the metric system. (3) The *subscription* is made up of directions to the apothecary. (4) The *signature* (Lat. *signetur*, let it be labeled) consists of directions to the patient: dose, time, and method of taking. This is followed by the physician's signature or initials. The body of a prescription may be composed of one or many ingredients, arranged in a specific manner, and each having a definite purpose to fulfill. The most important of these is the *base* or substance from which the chief therapeutic action is expected. This may be assisted in its operation by another ingredient, the *adjuvant*, and corrected or modified by a third called the *corrigent*. Lastly, for the sake of convenience of administration, to secure a definite quantity or consistency, to increase solubility and obtain uniform subdivisions into proper doses, certain substances having little therapeutic virtue in themselves, and variously known as the *vehicle*, *diluent*, *excipient*, or *menstruum*, are added. See Bartholow, *Materia Medica and Therapeutics* (New York, 1903).

PRESCRIPTION. In Roman legal procedure, a prescription was a plea which the praetor placed at the beginning of the instruction (*formula*) which he sent to the referee (*judex*), in order that it might be examined before all other disputed issues. The 'prescription of long time' was one of the most important of the Roman prescriptions; and in mediæval procedure the word prescription was used only to designate such a plea. In the broadest sense, prescription means the legalizing of an existing state of things in consequence of lapse of time—the establishment of legal rights by the prolonged exercise of corresponding powers, and the extinction of rights by prolonged failure to use the powers which they are supposed to confer. In early law the field of prescription is practically unlimited. In highly developed law no substantive rights are acquired or lost by prescription,

except rights in things. Remedial rights, or rights of action, however, are regularly lost by non-user.

Civilians divide prescription into 'acquisitive,' by which rights are created, and 'extinctive,' by which they are destroyed. For the prescription of actions, the English law employs the term limitation. See LIMITATION OF ACTIONS.

ROMAN LAW. PRESCRIPTION OF RIGHTS IN THINGS. According to the Twelve Tables, movables (except stolen things) were acquired 'by use' (*usucapio*) in one year, immovables in two. In the later Republic the praetors and provincial governors developed for provincial real estate a 'prescription of long time.' Justinian fused the two institutions, limiting the term usucapion to movables and prescription to immovables. Under the rules which he laid down, the person who acquired possession (q.v.) in good faith, and who maintained uninterrupted possession for a certain period, became owner. The period, in the case of movables, was three years; in the case of immovables, if the owner lived in the same province, it was ten years; if he lived in another province, it was twenty years. Public and ecclesiastical property was excluded from this ordinary prescription; also all property of which the owner had been dispossessed by theft or violence, although it had subsequently come into the hands of an honest possessor.

Justinian further enacted that when the owner's action of recovery was extinguished by prescription, the possessor, if he had acquired possession in good faith, should become owner. Property excluded from the ordinary prescription was in most instances capable of being acquired by this *prescriptio longissimi temporis* (thirty or forty years).

PRESCRIPTION OF ACTIONS. At early Roman law rights of action, as such, were perpetual: they ceased to exist only when the substantive right was lost (as by usucapion). The equitable actions given by the praetors, however, were limited; and Imperial legislation finally limited all actions. The periods varied from six months to forty years; the ordinary period was thirty years.

Acquisitive prescription and the prescription of actions were regularly suspended in the case of persons unable to exercise their rights, e.g. persons under household authority and infants.

IMMEMORIAL PRESCRIPTION. A survival from early law, when prescription had a wider range, is found in the rule that any state of things which has existed so long that no memory remains of its origin is presumed to have been legally established. The Roman jurists, however, invoked this rule only to protect public use of private property—e.g. rights of way and artificial water-courses—and to prevent interference with ancient dikes and channels regulating the flow of surface water.

MODERN CIVIL CODES. Prescription has lost much of its importance by reason of changes in the law of property (q.v.). The general retention or adoption of the old German rule that honest acquisition of movables gives title has left no room for prescription of movables except as regards lost or stolen things. In these cases the honest possessor apparently becomes owner when the former owner's action of recovery is extinguished, which occurs in periods varying from two to ten years. As regards real property, the

importance of prescription has been greatly lessened by official registration of titles and the indisposition of the law to recognize other than registered rights. Immemorial prescription has found no favor in the eyes of modern legislators.

Prescription of actions, in all the codes, is substantially Roman. There is a tendency, however, to shorten the period of limitation for ordinary debts, and to permit prescription to run against persons under guardianship, the guardians being of course responsible to their wards for losses due to their negligence.

GROUND OF PRESCRIPTION. Prescription rests primarily upon social interests. Statutes of prescription terminate controversy; they are 'statutes of rest.' The extinction of rights by prescription and limitation is further defended on the ground that it is a just penalty for negligence. In modern discussion, the shortening of the periods within which debts are recoverable is defended on the ground that long credits are undesirable.

In estimating prescription it should be remembered that it has other functions besides making bad titles good and liberating persons who are really debtors. It operates constantly to transform derivative titles, which are not always easy to prove, into original titles, based on recent facts and conditions. It also operates to relieve those who are not debtors, because they have discharged their obligations, from the burden of proving payment. In both cases, proof becomes increasingly difficult with the lapse of time; and the relief which prescription gives to true owners, and to persons who are not truly debtors, is invaluable and indispensable.

Consult authorities cited under CIVIL LAW; also Unterholzner, *Verjährungslehre* (2d ed., Leipzig, 1858); and Grawein, *Verjährung und gesetzliche Befristung* (1880).

ENGLISH AND AMERICAN LAW. In the common-law system prescription is employed in a narrower sense than in the legal systems derived from the Roman law, being restricted to the acquisition of the interests in land described as *incorporal*, such as easements and profits *a prendre*, the acquirement of title to personal property and to *corporal* interests in land by lapse of time being comprehended under the heads of ADVERSE POSSESSION and LIMITATION OF ACTIONS (qq.v.). The common-law theory of the effect of prescription is also radically different from that of the civil law, as its operation is not to sanction a wrongful possession, but to furnish evidence, more or less conclusive, of the lawful origin of the right claimed. This theory in English law took on the grotesque form of the doctrine of a lost grant, the open and notorious enjoyment of the right claimed without interruption for the prescriptive period raising a presumption that it was originally conferred by deed from the owner of the land affected, the tender of the deed in court being excused by the further fiction of its loss. This presumption may still be rebutted by showing that the alleged grantor could not possibly have made the grant in question, but in England (where prescriptions are now mainly governed by statute), as well as in the United States (where they are still regulated by the common law), the fiction of a lost grant has now generally been abandoned and the whole doctrine placed on a more rational basis by being assimilated to the principles governing adverse posses-

sion of lands. The latter, however, still retain many of the peculiarities derived from the feudal doctrines of seisin and disseisin (qq.v.), the legal title of the adverse holder of land being in theory based not on the length of his possession, but upon his seisin, however wrongful this may have been—the lapse of time operating only to 'quiet' the title thus obtained.

The period of prescription has varied from the 'immemorial enjoyment' of the earlier common law (interpreted to signify an uninterrupted user from the accession of Richard I., 1189) to the modern period, which, by analogy to the limitation of real actions by statute, is usually fixed at twenty years. As in the case of limitation, also, the prescriptive term will not begin to run during the existence of a legal disability—as infancy, insanity, or coverture—in the owner of the land over which the right in question is asserted, nor if the land is at the time of the adverse user in the possession of a tenant or disseisor. An easement or profit once acquired, however, against the tenant in fee simple binds the land into whosoever hands it may thereafter come.

The operation of the principle of prescription is further restricted by limiting it to rights of enjoyment of a common and well-known sort, and, in the United States, to such as answer the description of positive or affirmative, as distinguished from negative rights. Thus while rights of way, of drainage, and the like, may be gained by prescription everywhere, the negative easements of light and of lateral support cannot generally be acquired in this way in the United States, although in England no such distinction is recognized. But new and unusual incidents of ownership resting on prescription—such, for example, as the right to the access of air to a wind-mill or the right to a fine view—will not be admitted even in Great Britain. Such rights, as well as the negative easements, in this country arise only by grant.

Strictly speaking, prescriptive rights, as the expression is used in English law, are to be further distinguished from public or quasi-public rights in the nature of easements or profits, such as commons appendant, customary rights of way, and the like, even when these rest, as they commonly do, on immemorial enjoyment. The distinction rests on the fact that prescription in legal theory always presumes a grant; and if the right in question is claimed by an indefinite number of people, as in the case of a custom, it cannot rest on a grant, and is therefore not strictly prescriptive in character. Consult: Gale, *Easements* (7th ed., London, 1899); Washburn, *Easements and Servitudes*; 3 Harvard Law Review, 183.

PRESENTATION AT COURT. See COURT, PRESENTATION AT.

PRESENTMENT (OF. *presentment*, *presentement*, from *presenter*, to present, from Lat. *presentare*, to set before, from *presens*, pres. part of *presens*, to be at hand, from *præ*, before + *esse*, to be). An informal accusation by a grand jury, as to a crime coming to its notice, and afterwards reduced to the form of an indictment. It is usually the result of an investigation conducted before it, or based upon information as to a crime communicated to it by some one while it is in session. A presentment differs from an indictment in that the latter is

found by indorsing the words 'a true bill' on a formal bill of indictment prepared and laid before the grand jury by a prosecuting officer. The words presentment and indictment are frequently used as being interchangeable, but this is not sanctioned by the best authorities. See GRAND JURY; INDICTMENT.

Presentment also has a special meaning in the law of negotiable paper, as describing offering of a bill of exchange for acceptance, or a formal demand of payment. See BILL OF EXCHANGE; NEGOTIABLE PAPER.

PRESERVATION OF FOOD. See FOOD, PRESERVATION OF.

PRESIDENT (OF, *president*, Fr. *président*, from Lat. *presidens*, president, pres. part. of *presidere*, to preside, direct, sit before, from *præ*, before + *sedere*, to sit). The chief executive officer of the United States Government, chosen for a term of four years by an electoral college. In case of removal, resignation, death, or inability to discharge the duties imposed by the Constitution and laws he is succeeded by an officer called Vice-President. The electors by whom the President is chosen are appointed in each State in such manner as the Legislature thereof may direct, each State being entitled to as many electors as it has Senators and Representatives in Congress. At present the practice in every State is to choose the electors by popular vote on a general ticket. This election takes place on the Tuesday following the first Monday in November of the year preceding that of the Presidential election. These electors assemble in their respective State capitals on the second Monday of January following for the purpose of casting their votes, which are in turn transmitted to Congress and officially counted by that body on the second Wednesday of February. In case no candidate receives a majority of the electoral votes the election is taken to the House of Representatives, where the members voting by States choose a President from the three highest candidates on the list. This happened in 1800 and again in 1824. The President is inaugurated on the 4th of March following the election. He is eligible for reelection without limit as to the number of terms, but the precedent set by Washington of refusing a third term has never been broken. Eight Presidents have, however, served two terms each. The convention which framed the Constitution of the United States was well nigh unanimous in opinion as to what should be the character of the Presidential office, although there were differences of opinion as to what should be the tenure and mode of election. The State Governors and Presidents afforded a tolerably clear model for the creation of the national executive, and it may be said that these were followed rather than the British executive. The qualifications for the Presidency are fixed by the Constitution. They are citizenship acquired by birth in the United States, fourteen years' residence in the United States, and the completion of the thirty-fifth year of age. The President is required before entering upon the discharge of his duties to swear or affirm that he will faithfully execute the duties of the office to which he has been elected and to the best of his ability preserve, protect, and defend the Constitution of the United States. On the occasion of the inauguration the President delivers a public address in

which he announces his political policy, and annually upon the meeting of Congress he sends a message to that body containing information of the state of the Union and making such recommendations as may seem to him wise and expedient.

The President receives compensation for his services in a salary at present fixed by statute at \$50,000 per year and which can neither be increased nor diminished during the term for which he is chosen. He is also allowed the use of the executive mansion, together with the furniture and effects kept therein. He is prohibited by the Constitution from accepting any other emolument from any one of the Commonwealths or from any foreign Prince, King, or State. He is privileged from the jurisdiction of any court or magistrate, but may be impeached by the House of Representatives for treason, bribery, or other high crimes and misdemeanors, and upon conviction by the Senate must be removed from office. Being then divested of his official character, he is subject to indictment and trial in the regular courts as any other private individual. The privilege of resigning from office is recognized by the Constitution, and the formalities of relinquishment are prescribed by a statute of Congress.

The powers and duties of the President include the management of the foreign relations of the United States; the calling together of Congress in extraordinary session, and the furnishing it with information concerning the Government; the power to veto legislative measures; the command of the army and navy; the granting of reprieves and pardons; the execution of the laws; and the appointment of the officers of the United States. For a more detailed discussion of the duties and powers of the President, see UNITED STATES, and for the electoral votes cast for the various candidates for the Presidency and the Vice-Presidency, see ELECTORAL VOTES. See, also, ELECTORAL COLLEGE. Consult Stanwood, *History of the Presidency* (Boston, 1898).

PRESIDENT, THE. A United States frigate of 44 guns, built in 1794, at New York, and taken by the British in 1815.

PRESIDIO (Sp., garrison, guard) OF SAN FRANCISCO (Cal.). A United States military post, established in 1850, and comprising a reservation of 1480 acres in the suburbs of San Francisco and on the southern border of its harbor. It was originally a Spanish military post, was continued as such by Mexico, and eventually (1848) ceded to the United States. It has long been an artillery post, and in 1902 had quarters for 30 officers and 500 men.

PRESS. See METAL-WORKING MACHINERY; PRINTING; HYDRAULIC PRESS; DIES AND DIE-SINKING; etc.

PRESS, FREEDOM OF THE. The immunity of the printing press from responsibility to the Government for the character of the matter which it publishes except in the case of matter deemed libelous. (See LIBEL.) In the early history of the printing press no such immunity was recognized, and it became an established rule that a free press was wholly incompatible with an absolute government. The censorship of the press originated in the attitude of the Roman Catholic Church, which in 1515 formally decreed through the Council of the Lateran that no publication should be issued from any place over

which the Church had jurisdiction without the written sanction of the Bishop or of the Inquisitor of the diocese. The institution of the censorship gradually became a feature of the policy of the civil authorities in the various States of Continental Europe, from some of which it has not yet disappeared. At present no censorship exists in France, Switzerland, Sweden, Spain, Italy, Norway, the Netherlands, Belgium, Denmark, and Germany, but the press laws are very rigid in some of these, such as Spain, France, and Germany, and their governments claim and exercise the right to suppress in a summary manner journals deemed obnoxious to the public peace and security. The Constitution of France contains no guarantee in behalf of freedom of the press. That of Switzerland does, but authorizes the Cantonal governments to enact laws to prevent the abuse of the same and empowers the Federal Government to punish similar abuses when directed against its authority or that of its officers. The Constitution of Prussia secures to every person the right to express his opinion freely by word, writing, print, or pictorial representation, and prohibits the establishment of a censorship, but in the same article empowers the Legislature to place restrictions upon the press and to enact laws for the punishment of abuses of the liberty of printing. The laws enacted in pursuance of this provision are very severe and place substantial limitations upon the freedom of the press. In Russia the censorship in an arbitrary form still exists. There newspaper publishers are required to obtain permission to print and then lodge with the Government a considerable sum as caution money. Those who are unable to comply with the latter requirement are required to send their articles to a censor three days previous to publication.

In England, after a long struggle, almost complete liberty of press now prevails. From the time of the Reformation until the Commonwealth the English press was subject to a censorship under the direction of the Crown. During the period of the Civil War and the Commonwealth it was practically free from molestation, but upon the restoration of the Stuarts the old restrictions were revived. In 1694 the censorship of the press was discontinued. During the reign of Anne severe acts were passed against printers and some of the most distinguished men of letters of England, including Steele and De Foe, were punished for violating these laws. At the same time numerous tracts, books, and newspapers were burned by the common hangman. The censorship, however, was not revived. With a view to the repression of the obnoxious Whig press, the Tory Government imposed on printers a stamp duty which in the reign of George III. was increased to fourpence on every paper. Likewise taxes on advertisements were imposed. But these measures proved ineffective, and were finally repealed toward the middle of the nineteenth century. One of the most prolonged struggles in behalf of the freedom of the press in England was in relation to the publication of Parliamentary debates. Until 1729 newspaper reports of Parliamentary proceedings were unknown. About that time fragmentary reports began to appear in the newspapers, whereupon the Commons resolved that it was a breach of privilege, as it tended to make members answerable to their constituencies, and this is the theory to-day. For breach of this privilege many printers were prosecuted and

fined, in the year 1764 no less than 200 informations being filed in behalf of the Crown. (See WILKES, JOHN.) The real liberty of the English press dates from the passage of the Fox Libel Act of 1792, which enacted that the decision in libel suits belonged to the jury and not to the judge. This reversed the view which the courts had acted on for many years. At present the only restriction upon the press, except in case of libelous matter, is the common-law rule that the publication of anything against the Constitution of the country or the established system of government is an indictable offense.

In the American colonies the attempt was made to introduce the British system of a rigid censorship, and among the instructions to the colonial Governors was that they were to provide by all necessary orders that no person keep any press for printing, and that no book, pamphlet, or other matter be printed without their special leave and license first obtained. There were numerous instances of the public burning of books and the punishment of printers. (See BRADFORD, WILLIAM; ZENGER, PETER.) After the overthrow of British authority in the colonies the principle of the freedom of the press was incorporated in the first State Constitutions, and has been continued in all succeeding ones and without exception. The following is a common provision of the State Constitutions on the subject: "The printing press shall be free to every one who undertakes to examine the proceedings of the Legislature or any branch of the Government, and no law shall ever be made to restrain the right thereof. The free communication of thoughts and opinions is one of the inviolable rights of man, and every citizen may freely write and print on any subject, being responsible for the abuse of that liberty." It is usually further provided that in prosecutions for libel the truth may be given in evidence, that the motive shall be taken into consideration, and that the jury shall determine both the law and the facts. The great freedom with which the newspapers criticize and often ridicule public officials, especially by means of cartoons and pictures, has sometimes led to something of a reaction in favor of more stringent libel laws. As an example of this may be mentioned the stringent law passed in Pennsylvania in 1903. The Constitution of the United States prohibits Congress from passing any law abridging the freedom of the press. Notwithstanding this provision, Congress in 1798 passed an act for the punishment of persons convicted of printing matter calculated to bring the Government into disrepute. It was in force two years and there were a number of notable prosecutions under the law. See ALIEN AND SEDITION LAWS.

PRESS ASSOCIATIONS. Associations of newspapers or news agencies for the gathering and dissemination of news were unknown prior to 1849. Hitherto it had been entirely a matter of individual enterprise, but in that year, as a direct result of the rapid development of the telegraph, and steam transportation both on sea and on land, almost simultaneously the business of newsgathering through associated effort or special news agencies was begun both in Europe and the United States. In Europe the initiation of the service was due to Baron Julius Reuter, a Prussian, who during 1848 had been experimenting with schemes for facilitating the

transmission of news on the Continent. In 1849 he appeared in London and attempted to interest various daily newspapers in a plan for increasing the scope and efficiency of their foreign news service by acting in combination. His project was not favorably received at first, but one by one the great London dailies came to recognize the value of the new service, and although for the first ten years the more conservative confined their patronage to the department of financial news, a succession of lucky strokes in supplying early accounts of great political events at length won for the Reuter agency a world-wide recognition as the greatest existing factor in the gathering of international news. It maintains correspondents in every part of the world, and by a coöperative arrangement with the Associated Press in America its service is greatly extended. In England the exclusive distribution of all the Reuter telegrams to the provincial papers in the United Kingdom is in the hands of an organization in London known as the Press Association. This organization was formed in 1868, when the British telegraph lines were by act of Parliament taken over by the Government. It is a co-operative corporation, formed and controlled by the provincial papers, maintains an office with manager, editors, and correspondents in London, and has representatives in every town in the United Kingdom. Other British news associations include the Central News Agency, organized on the same lines as the Press Association save that it has foreign correspondents, the National Press Agency and the Exchange Company.

In the United States the first move toward associated effort in gathering news was made in 1847 in the formation of the Associated Press of New York, an organization of daily papers to reduce useless competition. This organization, finally launched in 1849, was the forerunner of all other similar associations in America. It extended its activities and scope rapidly, and as other news gathering agencies were formed throughout the country, it made such arrangements with them as practically to control the collection and distribution of news in the entire country. The monopoly enjoyed by the old Associated Press, which had practically absorbed an organization known as the Western Associated Press, lasted for many years. The refusal of the association to admit a paper to membership became almost a prohibition upon publication, and the withdrawal of a franchise proved likewise disastrous. Dissensions finally arose within the organization, and after several competing associations had been formed and failed, the United Press was finally successfully launched in 1882. The original Associated Press finally dissolved, and the greater part of the large metropolitan dailies joined the new organization. A rival to the United Press, however, soon appeared in the field in the new Associated Press, organized in Illinois on a mutual plan by Southern and Western papers. Subsequently, as a result of dissensions, the United Press dissolved, most of the New York members joining the Associated Press. In 1900 the Associated Press underwent a reorganization and was reincorporated in New York as a result of a decision of the Illinois courts in a suit brought to compel it to furnish news to other than association members. There are in the United States numerous

local Associated Press organizations, such as the New York City News Association, practically a branch of the Associated Press, and also numerous agencies for the dissemination of special sorts of news, such as financial, market, or agricultural. Other agencies having a more or less national service are the Laffan Bureau, organized by the New York *Sun* on the break-up of the United Press, and the Scripps-McCrea Syndicate.

PRESSBURG, prës'boörk (Hung. *Pozsony*). A royal free city and the capital of the County of Pressburg, Hungary, situated in a beautiful region, on the north bank of the Danube, 35 miles east of Vienna (Map: Hungary, E 2). It is one of the finest cities of Hungary. The fortifications of the old town have given place to spacious boulevards. The Danube is here spanned by the new King Francis Joseph iron bridge. The most attractive of the churches is the eleventh-century Gothic cathedral, in which the kings of Hungary were crowned. On the tower is a pyramid surmounted by a gilded royal crown. The old castle, burned in 1811 and existing now only as a ruin, was once the residence of the kings of Hungary. The beautiful thirteenth-century town hall contains a museum of Roman antiquities. The city has several handsome palaces, including the winter palace of the Primate of Hungary. Other interesting features are the Landhaus, the seat of the Hungarian Diet till 1848; the new theatre; the park with an open-air theatre; and the race course. The equestrian statue of Maria Theresa, erected in 1897, is also noteworthy. Among the educational institutions are a royal law school, a Catholic gymnasium, a Protestant lyceum, a priests' seminary, several industrial schools, and a rich library. The philanthropic institutions of Pressburg are among the best in Hungary. Pressburg has a large dynamite factory, a famous brush factory, and a new petroleum refinery. It also manufactures pastry, turnery ware, cabinet-work, tobacco, ribbons, cloth, machinery, leather, chemicals, champagne, etc. There is a lively trade, chiefly in grain, cattle, and wine. Population, in 1890, 52,411; in 1900, 61,537, of whom about two-thirds were Germans and three-fourths Catholics.

Pressburg is first mentioned in the ninth century. In the twelfth century it was strongly fortified, and became a place of great strategic importance. From 1541 to 1784 it was the capital of Hungary. Here in 1687 the Hungarian Diet formally accepted the hereditary succession of the Hapsburgs. After the battle of Austerlitz in 1805, Napoleon and the Emperor Francis concluded the Peace of Pressburg (December 26), by which Austria ceded the former Venetian dominions to the Kingdom of Italy, and Tyrol to Bavaria. Consult Ortway, *Geschichte der Stadt Pressburg* (Pressburg, 1892-98).

PRESENSE, prä-sän'sä', EDMOND DEHAULT DE (1824-91). A French Protestant clergyman. He was born in Paris, January 7, 1824; studied theology at Lausanne, Halle, and Berlin, and was pastor of the Free Evangelical Congregation of the Taitbout, Paris (1847-70). He was Deputy to the National Assembly (1871-76), and advocated amnesty to the National Guards who had joined the Commune, moderation in legislation concerning the 'International' organization, and free education. From 1883 he was a life Senator. He was an earnest advocate of the independ-

ence of the Evangelical Church from the State. He died in Paris, April 8, 1891. He founded the *Revue Chrétienne* and the *Bulletin Théologique*, and wrote many popular works, of which the following have appeared in English translation: *The Redeemer: Discourses* (1864); *The Land of the Gospel: Notes of a Journey to the East* (1865); *Jesus Christ: His Times, Life, and Work* (1866); *The Mystery of Suffering, and Other Discourses* (1868); *The Church and the French Revolution; a History of the Relations of Church and State, from 1789 to 1802* (1869); *Rome and Italy at the Opening of the Œcumenical Council* (1870); *Contemporary Portraits* (1880); *A Study of Origins; or, the Problems of Knowledge, of Being, and of Duty* (1883).

PRESENSE, FRANCIS DEHAULT DE (1853—). A French publicist, born in Paris. He entered the diplomatic service in 1879, was appointed secretary of embassy at Constantinople in 1880, and later in the same year at Washington. Having turned to journalism, he became one of the principal contributors to the *Temps*. He was prominent as a defender of Dreyfus, and through the press and by lectures carried on an important campaign in behalf of the accused captain. Among his publications are: *L'Irlande et l'Angleterre depuis l'acte d'union jusqu'à nos jours* (1889); *Le cardinal Manning* (1896); and *Un héros. Le lieutenant-colonel Picquart* (1898).

PRESS-GANG. See IMPRESSMENT.

PRESSLER, MAX ROBERT (1815-86). A German forester, born in Dresden. He studied at the School of Technology there, and taught in Zittau and in the Academy of Forestry at Tharandt until 1883. Pressler contributed largely to the advance of forestry by his inventions, among which the most important is the *Mess-knecht* for measuring the height of trees, and by his writings, which are full of novel theories for the most part based on exact calculation. *Der rationelle Waldeirt und sein Nachhaltswaldbau höchsten Reinertrags* (1858-85), his chief work, is a protest against the methods of the old school.

PRESTER JOHN, i.e. Presbyter, or Priest John. A supposed Christian king and priest, whose territory was believed during the Middle Ages to lie either in Asia or Africa. The first record of this personage appears in the chronicle of Otho of Freisingen, who lived in the twelfth century. From that time the legend grew and developed. It was believed, and various travelers so reported, that the Nestorian Christians had built up a large monarchy ruled over by a priest-king named John. Letters from this mysterious personage addressed to the Byzantine Emperor or the Pope were circulated, giving marvelous accounts of the inhabitants and the wealth of the territory. In the fourteenth century the home of Prester John was generally believed to be in Africa, where it was identified with the Christian Kingdom of Abyssinia. Consult: Yule, *Cathay and the Way Thither* (Hakluyt Society, 2 vols., London, 1866); id., *Book of Sir Marco Polo* (2 vols., London, 1874); Oppert, *Der Presbyter Johannes in Sage und Geschichte* (2d ed., Berlin, 1870); Zarneke, *Der Priester Johannes* (Leipzig, 1876-79).

PRESTO (It., quick). In music, a direction that a piece should be performed in a very rapid manner. In this tempo conductors mark only the

first beat. The term *prestissimo* is also sometimes used to denote the utmost possible rapidity of execution.

PRESTON. A manufacturing and market town in Lancashire, England, on the Ribble, at the head of its estuary, 21 miles north-northeast of Liverpool (Map: England, D 3). The town is well laid out and is surrounded with pleasing scenery. The chief public buildings are the town hall, which contains the guild hall and exchange; the Preston and County of Lancashire royal infirmary; the corn exchange and market house; the house of correction and court-house; the institution for the diffusion of useful knowledge; the public library; and the institute and school for the blind. Saint Walburge's Roman Catholic Church is noted for its lofty spire, 306 feet high. Preston's great municipal enterprise was the acquisition of the dock and harbor rights of the Ribble in 1883 for \$364,000 and an outlay on improvements of over \$6,000,000. The channel was deepened to admit vessels of 1000 tons, and a dock of 40 acres with warehouses and 6798 feet of quays was built. About 2500 vessels of about 350,000 tons burden enter and clear the port annually. Its principal export is coal; its imports are grain, iron, and timber. Besides the Ribble harbor rights, the town owns its water supply, tramways, markets, refuse destructor, sewage farm, and maintains baths, free libraries, and three large public parks. Cotton and linen are extensively manufactured. There are iron and brass foundries, iron ship-building yards, carriage works, machine shops, and malting, brewing, and rope-making establishments. Several great fairs are held here during the year, besides the usual weekly markets.

Originally called Priest's Town, from its ecclesiastical institutions, it received its first charter from Henry II. The celebrated Preston guild of merchants has held bi-decennial festivals since 1329, the earliest on record. During the Civil War the town declared for the King, but was taken by the Parliamentary forces, and near the town Oliver Cromwell overwhelmed the Scots in 1648. It figured in the Jacobite rebellions of 1715 and 1745. In 1832 Joseph Livesey here originated the total abstinence movement. Population, in 1891, 107,573; in 1901, 112,982. For histories of Preston, consult: Hewitson, *History of Preston* (Preston, 1883); Fishwick, *History of the Parish of Preston* (Roehdale, 1900).

PRESTON, HARRIET WATERS (c.1843—). An American novelist and translator, born in Danvers, Mass. Her chief original works are: *Aspendale* (1872); *Love in the Nineteenth Century* (1874); *Is That All?* (1876); *A Year in Eden* (with Louise Dodge, 1886); *Private Life of the Romans* (1893). Noteworthy among her translations are: *The Life of Madame Svecchine*, *The Writings of Madame Svecchine*, *Celebrated Women* (selected from Sainte-Beuve's *Portraits de femmes*), *Sainte-Beuve's Madame Desbordes-Valmore*, *Paul de Musset's Alfred de Musset*, *Mistral's Miréio and Calendau*, and *The Georgics of Vergil*.

PRESTON, JOHN SMITH (1809-81). An American political leader and a soldier in the Confederate service, born at Abingdon, Va. He graduated at Hampton-Sidney College in 1824, and after study at the University of Virginia and

at Harvard, traveled extensively in Europe. On his return to America he settled at Columbia, S. C., which continued to be his home, though he had large agricultural interests in Louisiana. He was a lover of the fine arts and liberally aided the American artist Hiram Powers (q.v.). His ability as an orator and a writer gave him a more than local celebrity, and he was for several terms a member of the South Carolina State Senate. As the Civil War drew near he became an ardent secessionist and was chosen to lead his State's delegation at the Charleston convention of 1860. The next year he was appointed one of the commissioners to Virginia, and he made a notable speech at Richmond urging the Virginians to leave the Union. At the outbreak of the war he entered the Confederate military service, and participated in the first battle of Bull Run. Soon afterwards, however, he was appointed chief of the Conscription Bureau, with the rank of brigadier-general. At the close of the war he went to Europe, where he remained several years, and though he finally returned to the United States, he continued until his death bitterly hostile to the established Government.

PRESTON, MARGARET (JUNKIN) (c.1825-97). An American authoress, born in Philadelphia, Pa. She married T. L. Preston of the Virginia Military Institute and lived afterwards in Virginia and Maryland. Her first writing appeared in 1849 in *Sartain's Magazine*. Her first book, *Silverwood* (1856), was a novel. Her later writings are almost entirely poetical, and express deep religious feeling and ardent sympathy with the cause of the South in the Civil War, especially in *Beechenbrook* (1866), in which are some widely known lines on Stonewall Jackson's grave, and a lyric "Slain in Battle." Other poems are collected in *Old Songs and New* (1870); *Cartoons* (1875); *Colonial Ballads* (1887); and *For Love's Sake* (1887). Later volumes are *Aunt Dorothy* (1890) and *A Handful of Monographs*. She wrote also a good translation of the Latin hymn "Dies Irae" (1855). She died in Baltimore.

PRESTON, RICHARD GRAHAM, Viscount (1648-95). An English Jacobite politician and conspirator. He was born in Netherby, Cumberland, and was sent to Westminster School, thence to Christ Church, Oxford, and became a member of Parliament for his native shire at the age of twenty-seven. For his support of the Stuarts, he was rewarded with a Scotch peerage (1681), and the following year as Viscount Preston he was sent on a diplomatic errand to France, but returned (1685) to enter the Parliament of James II., and became a member of the Privy Council. After the downfall of the Stuarts Preston continued to be their agent in France, and upon one of his visits to London was imprisoned in the Tower for six months, but continued his conspiracies and was regarded by the Jacobites as the true Secretary of State. In 1691 he was again captured and tried and was condemned to death by the English Government, but saved himself by betraying his fellow plotters. Once again he was imprisoned for refusing to give evidence against Jacobites, but finally retired and devoted himself to the revision of his translation of *De Consolatione Philosophiæ* by Boëthius, which was published posthumously.

PRESTON, THOMAS SCOTT (1824-91). An American Roman Catholic clergyman. He was

born at New Hartford, Conn., of Protestant parents. Though the son's early influences were adverse to ritualism, when he graduated from Trinity College, Hartford, in 1843 with the determination of entering the ministry, he took the vow of celibacy. After completing his course at the General Theological Seminary in New York, he became attached to Trinity Church, later to the Church of the Annunciation in New York, the Holy Innocents, West Point, and Saint Luke's, New York. He was among the first in America to respond to the influences of the Tractarian movement, and accepting the Roman Catholic faith, after a brief course of study at Saint John's College, Fordham, he was ordained to the Roman Catholic priesthood at Albany in 1850. He was first assigned as curate to the old Cathedral in Mulberry Street, New York, then transferred to the Church of the Immaculate Conception at Yonkers. Returning to the cathedral in 1853, he became secretary to Archbishop Hughes, and in 1855 assumed the direction of the chancery, which he continued to administer until his death. In 1861 he was appointed rector of Saint Ann's to succeed Dr. John M. Forbes (q.v.). In 1874 he became vicar-general of the archdiocese; two years later the Pope conferred the title of Monsignor, and in 1888 he was named a Prothonotary Apostolic. He was a strict disciplinarian and warm supporter of parochial schools. In this he was opposed by a faction whose prominent members were Dr. Edward McGlynn and Father Ducey (q.v.), the latter at one time his assistant at Saint Ann's. He published a number of books on devotional and controversial subjects, among which *Protestantism and the Bible* (1880) and *Protestantism and the Church* (1882) have been extensively used.

PRESTON, WILLIAM CAMPBELL (1794-1860). An American lawyer, orator, and educator, born at Philadelphia. In 1809 he entered Washington College (Va.), but the next year entered the South Carolina College, at which he graduated in 1812. About 1817 he went abroad, met Washington Irving and his brother, and with them made walking trips through Wales and Scotland. He returned to the United States in 1819, was admitted to the bar in 1820, and removed to Columbia, S. C., in 1822. He soon won a great reputation, particularly as a jury lawyer. From 1828 to 1832 he was a member of the Legislature, and was a prominent advocate of Nullification. In 1837 he was elected to the United States Senate as a Calhoun Democrat. In 1842, on account of differences of opinion with his constituents, he resigned and resumed the practice of law. From 1845 to 1851 he was president of the South Carolina College, and lectured on belles-lettres. Though very successful, he was forced to resign on account of failing health. Preston was recognized as one of the most finished orators in the United States.

PRESTONPANS, prës'ton-pänz'. A village in Haddingtonshire, Scotland, on the Firth of Forth, eight miles east of Edinburgh (Map: Scotland, F 4). It gives its name to the battle fought in the vicinity in which the Jacobites under Prince Charles Edward routed the royal army under Sir John Cope, capturing their cannon, baggage, and military chest, September 21, 1745. Population, in 1891, 2200; in 1901, 1721.

PRESTWICH. A cotton-manufacturing town in Lancashire, England, $4\frac{1}{2}$ miles north-north-west of Manchester (Map: England, D 3). It is a favorite residential suburb of Manchester merchants. Population, in 1891, 10,900; in 1901, 12,800.

PRESTWICH, JOSEPH (1812-96). An English geologist. He was born at Clapham, London, and was educated at University College, London. Though engaged as a wine merchant until his sixtieth year, he frequently contributed to the *Transactions of the Geological Society*, and in 1874 was appointed professor of geology at Oxford (1874-88). His reputation rests chiefly on his classification of the Tertiary deposits of England, which he was the first to correlate with the strata of the Paris basin, and on his promulgation of the theory of man's contemporaneity with other Pleistocene mammals. Of his publications, the most important is his treatise on *Geology* (2 vols., 1886-88), which is considered one of the best existing presentments of the principles of the science from the point of view of the anti-uniformitarian. Professor Prestwich was president of the Geological Society of London (1870-72); vice-president of the Royal Society (1870-71); and president of the International Geological Congress (1888). Consult the *Life and Letters of Sir Joseph Prestwich*, by his widow (1899).

PRESTWICHIA (Neo-Lat., named in honor of Prestwich, an English geologist. A fossil crab found in the Carboniferous coal measures of North America and Europe, and probably closely ancestral to the modern horse-shoe crab or *Limulus*. The chief interest of this fossil lies in its close resemblance to one of the larval stages of *Limulus*, in which respect it forms a link in the history or phylogeny of the latter peculiar organism.

PRESUMPTION (Lat. *præsumptio*, anticipation, from *præsumere*, to presume, anticipate, take for granted, from *præ*, before + *sumere*, to take). In law, in its broadest sense, an inference as to the existence of a fact not known or proved to exist, which inference arises from its logical connection or association with certain other facts which are known or proved. As thus defined, a presumption may be nothing more than a mere inference of fact such as a jury is required to make in rendering a verdict. Thus, proof of the loss of a vessel in a storm with the other attendant circumstances may create a presumption or inference of the fact of death of a passenger sufficient to justify a jury in finding the death of the passenger as a matter of fact, unless the 'presumptive' proof of the fact of death is rebutted or explained away by proof of other circumstances.

In a narrower and more important sense the term signifies an inference of fact which is required by some positive rule of law to be made from the proof or known existence of certain other facts. Thus, the proof that one has not been seen or heard from by his friends or acquaintances for a considerable period, together with other circumstances, may or may not give rise to the presumption of his death; but if the absence is prolonged for a period of seven years, it is a positive rule of the common law that such absence, when unexplained, shall be deemed presumptive evidence of death.

It is evident that the effect of a presumption of this class is to give a weight or significance to facts actually proved in a given case not warranted by logic and not justifying in the absence of an express rule of law a finding by the court or jury of the existence of the fact presumed. Such presumptions are based upon considerations of convenience and serve a useful purpose in aiding in the proof of facts which it might be impossible to establish by any inference logically flowing from facts actually proved. It is for this reason that presumptions of this class are sometimes called 'presumptions of law'; that is, presumptions required by the law, as distinguished from mere logical inferences of fact. In strictness, however, such presumptions are true presumptions of fact. The effect of the presumption is *prima facie* to establish a fact, which, however, may be rebutted by the proof of other facts inconsistent with the fact presumed.

There is still a third class of presumptions so called, which are not true presumptions at all, but legal fictions. They are in reality rules of substantive law, although stated as presumptions of fact, and consequently they cannot be explained or rebutted. Thus the conclusive 'presumption' that a child under the age of seven has not capacity to commit a crime, or that one is presumed to know the law or the contents of certain public records, is not a presumption, but a positive rule of law which cannot be controverted. Oftentimes such rules of law originated as presumptions of fact, as, for example, the rule that twenty years' use of a right or interest in real estate gives rise to the conclusive presumption that such use is by virtue of a lost grant and is therefore lawful. Originally the presumption was a presumption of fact, which might be rebutted like any other true presumption, but with the sanction of a long line of judicial decisions the presumption became adopted as a rule of substantive law, if there had been twenty years' user of the property which established the lawfulness of the use as a matter of law, and the question as to whether the use of property was by virtue of a lost grant ceased to be a jury question.

The function of true presumption is primarily to aid a litigant in sustaining the burden of proof cast upon him by the pleadings in a case or by the rules of procedure.

Some of the typical presumptions, in addition to those already mentioned, are: One charged with a crime is presumed to be innocent. Infants between the age of seven and twelve are presumed to be incapable of committing a crime. A state of facts proved to exist is presumed to continue to exist. Letters having been proved to have been properly mailed are presumed to have been received. The unexplained failure of a party to a litigation to testify in his own behalf gives rise to the presumption that his testimony would be unfavorable to his case. This rule, however, has no application to one placed on trial upon a criminal charge, as the effect of such a presumption would be to deprive the accused of his legal right not to testify. There are many other presumptions of less frequent use which are founded upon the same general principles. See *Burden of Proof*, under EVIDENCE. Consult the authorities noted under EVIDENCE; also Lawson, *The Law of Presumptive Evidence* (2d ed., San Francisco, 1899).

PRETENDER (from *pretend*, OF. *pretender*, Fr. *prétender*, from Lat. *pretendere*, to pretend, allege, hold out, from *pre*, before + *tendere*, to stretch). The name borne in English history by the son and the grandson of the dethroned James II., the two being specifically known as the Old Pretender and the Young Pretender, respectively. See STUART, JAMES FRANCIS EDWARD; STUART, CHARLES EDWARD LOUIS PHILIP CASMIR.

PRETENSE, ESCUTCHEON OF. See ESCUTCHEON.

PRETI, præ'tè, MATTIA (sometimes MARCO, or MARIA) (1613-99). An Italian painter of the Neapolitan School, born at Taverna, Calabria. He was also called Il Cavaliere Calabrese, and Cordisco. He was a pupil of Lanfranco in Rome, or, according to other authorities, of Guercino in Cento, and also studied in France, Spain, and Antwerp, and ultimately settled in Malta, where he died. He was a follower of Caravaggio and Sabbatino, and has the same skill in the use of chiaroscuro. His works include "The Prodigal Son," in the Naples Museum, and frescoes in the Church of the Carmine, Modena, and in San Pietro a Majella, Naples.

PRETORIA. The capital of the Transvaal Colony, formerly the South African Republic, British South Africa. It is situated 4500 feet above sea-level on the southern slope of a spur of the Magalies Berge, in the south central part of the colony, 35 miles by rail, north-north-east of Johannesburg (Map: Transvaal Colony, E 4). It was regularly laid out on an extensive scale, with wide and straight streets crossing at right angles, but, although it became the converging point of the main railroad lines from Delagoa Bay and Port Elizabeth, it never acquired much economic importance, owing to the competition of Johannesburg. The Raadzaal or former Parliament House, 126 feet high, surmounted by a statue of liberty, is the most important building. The population is about 15,000, of whom 10,000 are whites. Pretoria, named after the Boer General Pretorius, was founded in 1855 to succeed Potchefstroom as capital of the Transvaal Republic. In May, 1900, it surrendered to the British, after which its four imposing but useless fortresses were dismantled. Consult Boyd, "Pretoria," in *Anglo-Saxon Review*, vol. iv. (London, 1900).

PRETORIUS, Dutch pron. præ-tò'ri-us, MARTINUS WESSELS (1827-1901). A South African soldier and statesman, the first president of the South African Republic. He was born in Natal, the son of Andries Pretorius, one of the leaders of the 'Great Trek,' and subsequently commandant-general of the Boer forces. He succeeded to his father's rank and position upon his death in 1852, and strove to carry out his policy, which had for its object the consolidation of the various independent Boer states. He won distinction as a military commander in the wars with the Kafirs, and in 1860 was chosen president of the Orange Free State. When, in 1864, the small Boer states north of the Vaal River combined to form the South African Republic, Pretorius left the Free State and threw in his fortunes with the new republic, of which he was at once elected president. He was re-elected in 1869, but in the following year, because of dissatisfaction over the arbitration agreement to which he had assented, in reference to territory

claimed by the Baralong tribe, he resigned office. The acts of his successor, President Burgers, led in 1877 to friction with the British authorities, and to a proclamation annexing the Transvaal to the British Empire. Pretorius took a prominent part in the revolt which followed, and after the independence of the Republic was recognized in 1880 he, with Kruger and Joubert, organized a provisional Government. Pretorius expected to be chosen president, but the commanding position won by Paul Kruger in the struggle led to his election in 1883, and the final retirement of Pretorius to private life. He was one of the most conservative of Boer leaders, and during his last years bitterly opposed the war policy of Kruger, declaring prophetically that it meant the final extinction of both the Boer republics.

PREUSCHEN-TELMANN, proi'shën tsel'mân, HERMINE VON (1854—). A German painter and author. She was born at Darmstadt, studied under Keller in Karlsruhe, and attained her earliest and greatest fame in floral paintings, marked by brilliant colorings. She traveled widely, and devoted herself to still life, and then to a symbolic manner which she described as 'historical still life.' Her most striking picture is "Mors Imperator." Her literary labors include the poems, *Regina Vita* (1888); *Via Passionis* (1895); and *Vom Mondberg* (1900); and the fiction, *Tollkraut* (1893); *Von ihm und Ihr* (1900); and *Dunkelkammer* (1901).

PREVESA, præ-vä'sá. A fortified seaport of Turkey in Europe, in the Vilayet of Janina, situated at the entrance to the Gulf of Arta in the extreme southwestern corner of the country (Map: Balkan Peninsula, C 5). It has considerable trade. Population, about 7000.

PREVIOUS QUESTION. A question put to a parliamentary assembly upon motion of a member to ascertain whether it is the will of the assembly to vote at once and thus put a stop to further debate on the subject under consideration. The form of the previous question is: "Shall the main question now be put?" If the vote is in the affirmative, the subject under discussion must then be voted on without further debate on the main question or amendment. This puts it in the power of a bare majority to shut off debate at any time. Under the name of 'closure,' this method of parliamentary tactics was first extensively resorted to by Mr. Gladstone in the House of Commons in 1882 in order to prevent dilatory or obstructive motions of the minority. It has been frequently resorted to in the United States House of Representatives from the earliest time, but up to the present time has not yet been tried in the Senate, where the practice of unlimited debate is allowed. In the House of Representatives the defeat of the previous question operates to keep the business before the House as though no motion had been made, but in the English Parliament it has the effect of postponing consideration for the day. The object of the practice in the United States is to hasten action, and a motion is made by a friend of the measure; in the English Parliament the purpose is to get rid of the subject for the time, and the motion is made with the purpose of voting against the measure. Thus in the United States House of Representatives the mover of the previous question votes for it, while in England he votes against it. At first in the House

of Representatives the previous question was debatable, and if it was negatived the main question was postponed for the day, according to the English practice; but in 1805 a rule of the House declared it to be undebatable, and in 1860 a rule was adopted by which consideration of the subject is resumed when the previous question is negatived, thus completely changing the English practice. The original rule of the House provided that the effect of the adoption of the previous question was to cut off all motions except the main question, but this was later changed so as to allow a vote first on the pending amendments and then on the main question.

PREVOST, pré'vó', AUGUSTINE (1725-86). A British soldier. He was born in Geneva, Switzerland; entered the British army, and in the French and Indian War distinguished himself in Wolfe's attack on Quebec, holding at the time the rank of a captain in the Sixtieth Regiment. He became lieutenant-colonel in command of the regiment in 1761, and after the death of General Henry Bouquet in September, 1765, succeeded him in command of the British troops in the Southern Department, with headquarters at Pensacola. He was still in command on the southern frontier at the outbreak of the Revolution, and late in 1778 he invaded Georgia, captured Sunbury, and with Colonel Campbell, who had captured Savannah, practically subdued for the time being the uprising in Georgia. In March, 1779, he abandoned Augusta on the approach of General Ashe, but later, at Brier Creek, turned and administered a severe defeat to his pursuers. He then drove Moultrie back on Charleston, laying waste the country with fire and sword as he advanced, and encouraged his Cherokee allies to acts of the greatest barbarity and cruelty. Before he could take Charleston, however, Moultrie, its commander, was joined by Pulaski with reinforcements from the Northern Army, and Prevost withdrew into Georgia. In October, 1779, he repulsed an attack on Savannah by the combined French and American forces under D'Estaing and Lincoln. For this success he was promoted to be major-general, but took little further part of any importance in the operations in the South.

PRÉVOST, prá'vó', EUGÈNE MARCEL (1862—). A French novelist, born in Paris May 1, 1862. He was educated by the Jesuits and at the Polytechnic School, engaged in tobacco manufacturing, and entered the literary field in 1891. In 1887, however, he published *Le Scorpion*, an attack on Jesuit education; and this story was followed by *Chonchette* (1888) and *Mademoiselle Jaufré* (1889), both of which were less crude and more sentimental and idyllic, though with some affectation of moralizing. *Cousine Laura* satirized the distortions of love, and the author pursued the theme in *La confession d'un amant* (1891). His next work, *Lettres de femmes* (1892), was the first to win distinct notice. It was succeeded by *Nouvelles lettres de femmes* (1894) and *Dernières lettres de femmes* (1897). The series are gracefully written, witty, ironical, ingenious, and thoroughly seasoned to the moral taste of the French. The dominant note is sensual perversity. *L'automne d'une femme* (1893) is nobler, but *Les demi-rierges* is distasteful, and *Le moulin de Nazareth* (1894) may be classed as revolting. *Notre compagne* (1895), a collection of stories, is, on the other hand, never vulgar, always

clever, and often pure; and *Le jardin secret* (1897) is a strong and worthy narrative of conventional marriage, with the moral of Goethe's *Die Mitschuldigen*. In 1900 appeared *Les vierges fortes*, which was composed of two volumes, *Prédérigue* and *Léa*. In 1901 *L'heureux ménage* was published. These last volumes deal with the woman question, both as concerns the education and the free life of young girls, and the marriage relation. M. Prévoſt does not appear to find that the new or higher education for young women, as he understands its development in England and America, points to anything very satisfactory for the French. As a whole, his stories suggest Bourget and Maupassant. At his best he is less powerful, less searching, but in narration he is admirably deft, lucid, compact, swift, and unerring. His feminine psychology is masterly, and probably no French author of his generation has so intimately understood the delicate, intricate nature of women.

PREVOST, Sir GEORGE (1767-1816). A British soldier and administrator. He was born in New York, entered the British Army in 1783, when he became a captain, and between 1790 and 1801 saw considerable service in the West Indies, commanding the British troops in Saint Vincent in 1794-95, and acting as Military Governor of Saint Lucia from 1798 to 1801, after which for a year he was Civil Governor. In 1802 he was appointed Captain-General and Governor-in-Chief in Dominica. Created a baronet in 1805, he was the same year made a major-general, and three years later a lieutenant-general. In 1808 he was appointed Lieutenant-Governor and commander-in-chief of Nova Scotia; in 1809 was second in command at the capture of Martinique, and in September, 1811, succeeded Sir James Craig as Governor of Lower Canada and Governor-General of British North America, which position he retained throughout the War of 1812, nominally, but not always actually, directing, as commander-in-chief, the British operations in Canada. On May 29, 1813, in concert with Sir James Yeo, he made an unsuccessful attack upon Sacketts Harbor, N. Y., and on September 11, 1814, in conjunction with Downie, who commanded the naval forces, was again unsuccessful in an attack upon Plattsburg, N. Y., where he was repulsed by the Americans under Macomb. For his faint-heartedness, or lack of enterprise, on the latter occasion he was called before a court-martial, but died before a verdict could be rendered.

PRÉVOST D'EXILES, prá'vó' däg'zól', ANTOINE FRANÇOIS (1697-1763). A French novelist, best known as the author of *Manon Lescaut* (q.v.). Prévoſt was born at Hesdin, April 1, 1697. His father was a petty official. Antoine had been by turns a student of the Jesuits, a novice among them, a soldier (1713-14), a Jesuit, a soldier again, and, as "the unhappy end of a too tender attachment," a Benedictine (1721-28). Then we hear of him as wanted by the police for a libel on the Duke of Tuscany and for alleged breaches of conventual discipline. It was a fateful period in the history of the French novel when Prévoſt sought refuge in England (1728), where he remained for two or three years, and, after a hasty and not wholly voluntary departure, returned thither in 1733 famous as author of the *Mémoires d'un homme de qualité*, the seventh volume of which is his greatest and shortest

novel, *Manon Lescaut* (1731). Prévost remained once more two years in England, viewed askance by the Huguenot colony, and so thrown more with the English, the result of which appears in *Clévaland, ou le philosophe anglais* (8 vols., 1731-38); *Les mémoires de M. de Montcal*; and an Irish novel, *Le doyen de Kilerine* (6 vols., 1735-40), which he followed after his return by a story based on the life of the fascinating Greek girl, Mademoiselle Aïsse, a then reigning Parisian celebrity. He died at Chantilly, November 23, 1763. Prévost wrote also two other novels, *Mémoires pour servir à l'histoire de Malte*, and *Mémoires d'un honnête homme*; but the latter years of his life were devoted almost wholly to translations of the novels of Richardson, begun in 1742, by which he influenced literature more even than by *Manon Lescaut*, propagating an indiscriminating interest in England and the English, whose democratic spirit inspired him to warm enthusiasm. Thus he helped to shake French confidence and pride of social and intellectual superiority, and to pave the way both for a cosmopolitan literary spirit and for Rousseau. Most of his novels are exotic in scene and in ethics, extravagantly romantic in structure, and with a new intensity of sentiment in depicting the tragedy of middle life.

His average work closely resembles the lesser novels of Defoe, but *Manon* is the proclamation in fiction of the "divine right of passion." It affected radically the novels of Rousseau and Diderot, and can be traced through Hugo, and Dumas, and George Sand, to the present day. Prévost himself tells us that the story is "a terrible example of the force of passion." The author does not preach, though his sympathy seems to go out toward his attractive sinner. The book is a portrayal of a coquette whose love of dress and finery as well as her passion for her chevalier are in desperate conflict with the miseries of life, to which contribute a pack of scoundrels, including her own brother. The style of this epoch-making work is more natural than that in any other of the author's books. In Richardson Prévost found a fuller expression of himself than he had yet been able to attain. *Pamela* in English began to appear in 1740. Prévost recognized its value instantly, and in 1742 his French version appeared in London. The English *Clarissa* is of 1748-49, the French of 1751; Richardson begins *Graudison* in 1753; Prévost, while awaiting its completion, busies himself in an attempt to spread English and German literature in France through founding with Rousseau a *Journal étranger*. Prévost's work was that of editor, as much as translator, and Richardson greatly profited by the process. Prévost's *Œuvres choisies* appeared in 39 volumes (Amsterdam, 1783-85; 1806). Of *Manon Lescaut* the editions are many. Consult: Texte, *Jean Jacques Rousseau and the Cosmopolitan Spirit in Literature*, trans. (New York, 1899); Sainte-Beuve, *Portraits Littéraires*, vols. i.-iii. (2d ed., Paris, 1864); id., *Causeries du lundi*, vol. ix. (ib., 1857-62); Harisse, *L'Abbé Prévost* (Paris, 1896).

PRÉVOST-PARADOL, pa'ra'dôl', LUCIEN ANATOLE (1829-70). A French journalist and author, born in Paris, August 8, 1829. He studied at the Collège Bourbon and at the École Normale, and in 1851 obtained the French Academy's prize

for eloquence. After obtaining his degree of doctor of letters in 1855, he was appointed to the chair of French literature at Aix; but in the following year resigned his professorship and became one of the editors of the *Journal des Débats*, writing most of the leading articles. He also wrote for the *Courrier du Dimanche*, and his opposition to the Empire and his advocacy of a responsible Ministry brought him into difficulties with the censorship. He was twice an unsuccessful candidate for a seat in the Corps Législatif. In 1865 he was elected a member of the Academy, and in 1868 visited England, where he received a warm welcome. Believing that the Empire had at last adopted the principle of parliamentary government, he consented in 1870 to fill the post of envoy at Washington; but, undeceived by the events connected with the proclamation of war with Prussia, he committed suicide at Washington, July 20, 1870. His chief works are: *Revue de l'histoire universelle* (1854); *Essais de politique et de littérature* (1859-63); *Quelques pages d'histoire contemporaine* (1862-66); *La France nouvelle* (1868). Consult Gréard, *Prévost-Paradol* (Paris, 1894).

PREYER, pri'ēr, WILHELM THIERRY (1841-97). A German physiologist and psychologist, born at Moss Side, near Manchester, England. He was educated at the universities of Bonn, Berlin, Heidelberg, Vienna, and Paris; became a lecturer in the philosophical faculty at Bonn in 1865; in 1867 in the faculty of medicine also; and in 1869 was appointed professor of physiology and director of the physiological institute at Jena. In 1888-93 he was a lecturer at Berlin. He made laboratory investigations in regard to spectrum analysis, propounded a theory of sleep, investigated the limits of perception of pitch, and applied the principles of H. G. Grassmann's (q.v.) theory of extension to psychology. He also conducted researches in connection with the blood, respiration, the color-sense, and other subjects. In addition to papers contained in the publications of learned societies and contributions to Pflüger's *Archiv für die gesamte Physiologie*, Liebig's *Annalen*, and other scientific periodicals, he wrote several volumes, including *Die Blausäure* (2 pts., 1868-70); *Die Blutkrystalle* (1871); *Naturwissenschaftliche Thatsachen und Probleme* (1880); *Biologische Zeitfragen* (2d ed. 1889); *Die Seele des Kindes* (4th ed. 1895); *Zur Psychologie des Schreibens* (1895); and *Darwin; sein Leben und Wirken* (1896).

PRIAM (Lat. *Priamus*, from Gk. Πρίαμος). In Greek legend, a son of Laomedon and Strymo or Placia (others give his mother other names), and last King of Troy. His name was originally Podarees, but was changed to Priam, on account of his having been ransomed by his sister Hesione from Heracles, who had made him prisoner when he captured Troy from Laomedon. His first wife was Arisbe, daughter of Merops, whom he gave away to a friend in order to marry Hecuba, by whom, according to Homer, he had nineteen sons; though from other wives the number was increased to fifty and as many daughters, whose names, with some variations, may be found in Apollodorus and Hyginus. The best known of the sons are Hector, Paris, Deiphobos, Helenus, Troilus, and of the daughters, Cassandra and Polyxena. Priam is represented as too old to

take any active part in the Trojan War; and in Homer, only once appears on the field of battle to ratify the truce before the duel of Paris and Menelaus. He, however, takes part in Trojan councils, and after the death of Hector visits the Grecian camp, guided by Hermes, to ransom the body of his son from Achilles. The later epics recounted his death at the capture of the city in somewhat different ways. The usual account represents him as slain by Pyrrhus, son of Achilles, in his own palace court at the altar of Zeus Herkeios, where he had taken refuge, after a feeble attempt at resistance.

PRIAPUS (Lat., from Gk. Πρίαπος, *Priapos*, Πρίπος, *Priēpos*). One of the lesser figures in the ordinary Greek and Roman mythology, though at Lampsacus, Cyzicus, and other places in the fertile districts on the Hellespont and Propontis he was held in high honor. The Lampsacene tradition called him son of Dionysus and Aphrodite, but his parentage was variously related. He was a god of fruitfulness and reproduction, particularly of gardens and vineyards, though his protection was also extended to the flocks and herds. In art he was sometimes represented as old and effeminate, clothed in Asiatic garb, a kerchief on his head, and with the folds of his garment held up and filled with fruit. More commonly his image was set up in gardens and vineyards to scare away birds and thieves. The character of these images led to many coarse jests in the poets and elsewhere. The *Priapea* is a collection of 80 short Latin poems, partly collected from the walls of the Temple of Priapus, and for the most part apparently not later than the Augustan age. Edited by Bücheler, *Petronius*, etc. (3d ed., Berlin, 1894).

PRĪBRAM, przhĕbrám, or **PRZIBRAM**. A town of the Crownland of Bohemia, Austria, 33 miles southwest of Prague (Map: Austria, D 2). It derives its importance from extensive lead and silver mines in the neighborhood, the largest in the Empire. They were worked as early as 1330, and since 1819 have been mainly the property of the Government. One of the shafts, the Albertschacht, is about 3400 feet deep. Close to the town is the Heilige Berg, a shrine visited by more than 100,000 pilgrims yearly. Population, in 1900, 13,576, mostly Bohemians.

PRIBER, prĕbār', **CHRISTIAN**. A French Jesuit who came among the Cherokee in 1736 and settled at Great Tellico town, in what is now East Tennessee. He at once set to work studying the Cherokee language, compiling a dictionary and grammar, and adapting himself to the native dress and mode of life for the time, in order better to accomplish their civilization and conversion. He drew up for their adoption a regular form of government modeled upon the European plan, with a prominent chief as principal ruler and himself as secretary. Fearing that the result would be to win over the Cherokee to the French interest, the English Government of South Carolina undertook to arrest him, but the Indians refused to give him up, and the commissioner was obliged to return under safe-conduct of an escort furnished by Priber. In 1741, however, he was seized by some English traders while journeying in Alabama and sent as a prisoner to Frederica in Georgia, where he soon afterwards died in prison.

PRIBYLOV, prĕ'bĕlŏf', **PRIBILOFF** (or **SEAL**) **ISLANDS**. A group of small volcanic islands in Bering Sea, belonging to the United States, 200 miles northwest of Unalaska, Alaska (Map; Arctic Regions, A 5). They aggregate 170 square miles in area, Saint Paul and Saint George being the largest. They are perfectly isolated and surrounded by fog, which causes the fur-seal to select these grounds for the purpose of breeding, so that these islands are the principal centre of the Bering Sea seal fisheries. They have about 400 permanent inhabitants.

PRICE, **BONAMY** (1807-88). An English economist. He graduated at Worcester College, Oxford, in 1829, taught from 1830 to 1850 at Rugby, and from 1868 until his death held the Drummond professorship of political economy at Oxford. He was an earnest advocate of the principles of free trade, and, in a series of lectures delivered in the United States (1874), he gave vigorous expression to his opinion on the subject. His publications include: *The Principles of Currency* (1869); *Currency and Banking* (1876); and *Practical Political Economy* (1878).

PRICE, **IRA MAURICE** (1856—). An American educator, born near Newark, Ohio. He graduated at Denison University in 1879, and for a year was professor of Greek and modern languages at the University of Des Moines—now Des Moines College—in Iowa. He was professor of Hebrew and cognate languages in the Baptist Union Theological Seminary in 1888-92, and then associate professor of the Semitic language and literature in the Graduate School of the University of Chicago. His works include: *An Introduction into the Inscriptions Discovered by Mons. E. de Sarzee* (1887), and *Syllabus of Old Testament History* (1891).

PRICE, **JOHN** (1600-c.1676). An English scholar, born in London. He studied at Christ Church, Oxford, and in 1635 attracted the attention of scholars by his edition of Apuleius's *Apologia*. Subsequently he held the Greek chair at Pisa, and still later was at Rome under the patronage of Cardinal Barberini. He was generally ranked among the foremost scholars of the time, this estimate being based for the most part on his work in Apuleius. Other publications by him are the *Metamorphoses* of Apuleius (1650), and numerous biblical commentaries, particularly on New Testament books, whose value is impaired by unwarranted emendations.

PRICE, **LANGFORD LOVELL** (1862—). An English economist and author, born in London. He was educated at Trinity College, Oxford, in 1888 became fellow and treasurer of Oriel, and was Newmarch lecturer in statistics at University College, London, in 1895-96. In 1897 he became governor of Dulwich College, and in 1898 was appointed an examiner in the moral sciences tripos at Cambridge. His publications include: *Industrial Peace* (1887); *Economic Science and Practice* (1896); *A Short History of English Commerce and Industry* (1900); and other works on subjects of political economy.

PRICE, **RICHARD** (1723-91). A British non-conformist divine, author, and political and moral economist. He was born at Tynnton, Wales, the son of a dissenting minister of stern Calvinistic tendencies. He completed his education

at the Fund Dissenting Academy in London, was a private chaplain at Stoke Newington from 1743 to 1756, and in 1758 was appointed preacher at Stoke Newington; later, until the year of his death, he held this appointment in conjunction with the ministry of Hackney. In 1769 he published his *Treatise on Reversionary Payments*; this was followed by his *Appeal on the Subject of the National Debt*, and by the compilation and publication of the celebrated *Northampton Mortality Tables*, and various works relating to life assurance and other annuities, forming most valuable contributions to the branches of science to which they respectively refer. In 1776 appeared his *Observations on Civil Liberty and the Justice and the Policy of the War with America*. Of this work 60,000 copies are said to have been sold in a few months. So greatly was it admired in the United States that the American Congress in 1778, through Franklin, communicated to him their desire to consider him a fellow citizen, and to receive his assistance in regulating their finances; an offer which he declined, principally on the ground of age. The work procured him the freedom of the city of London, and in 1783, at the same time as Washington, he received the honorary degree of LL.D. from Yale University. He died April 19, 1791. Consult Morgan, *Memoirs of the Life of Richard Price, D.D.* (London, 1815).

PRICE, STERLING (1809-67). An American soldier, born in Prince Edward County, Va. He was educated at Hampden-Sidney College, but removed to Chariton County, Mo., in 1831. In 1844 he was elected to Congress, but in 1846 he resigned and raised the Second Missouri Cavalry for the Mexican War. Under Gen. Stephen W. Kearney he marched from Fort Lavenworth to Santa Fé, suppressed an insurrection, and completed the conquest of California. He was promoted to be brigadier-general of volunteers July 20, 1847, marched to Chihuahua, and defeated a Mexican force in one of the last battles of the war at Santa Cruz de Rasales, March 16, 1848. From 1853 to 1857 he was Governor of Missouri. In the beginning of 1861 he was a 'Conditional Union' man, and co-operated with F. P. Blair (q.v.) and his 'Unconditional Union' party in calling the convention, of which he became president, to consider the secession of the State. He eventually joined the secessionists, was appointed major-general of State troops, May 18th, and began to organize the forces. He participated, under McCulloch, in the battle of Wilson's Creek, August 10, 1861; retreated before General Frémont, and spent the winter at Springfield. On the approach of Gen. S. R. Curtis, he retreated into northwest Arkansas. On March 7-8, 1862, he participated, under Van Dorn, in the battle of Pea Ridge, and soon afterwards was made a major-general of the Confederate Army, his commission being dated the day before this battle. Next he served around Corinth, and joined General Beauregard at Tupelo. He was assigned to command the Army of the West, but operated first in Tennessee. On September 19, 1862, he was defeated by Rosecrans at Iuka, Miss., and on October 3-4, 1862, took part in General Van Dorn's unsuccessful attack on Corinth. He served in northern Mississippi until February, 1863, when he was transferred to Arkansas. On July 21, 1863, he

took part in the unsuccessful attack on Helena. While in command of the district of Arkansas, under Gen. E. Kirby Smith, he opposed Gen. Frederic Steele. In September, 1864, he made a raid into Missouri, fought a number of battles and skirmishes, and gained 5000 recruits, but was forced to retreat into southwest Arkansas. At the close of the war he went to Mexico and became interested in a colonization scheme, but returned in 1866. Consult Snead, *The Fight for Missouri* (New York, 1886).

PRICE, THOMAS RANDOLPH (1839-1903). An American scholar, born in Richmond, Va. He studied at the University of Virginia, and at Berlin and Kiel until 1861, when he came home and served in the Confederate Army during the Civil War. In 1867 he was appointed to the professorship of Latin and Greek at Randolph College, and afterwards had the chair of Greek and English there, and the chair of Greek in the University of Virginia until 1882, when he was made professor of English language and literature in Columbia University. He edited *Othello* in the Bankside Shakespearé (1890), and published previously *The Teaching of the Mother-Tongue* (1877) and *Shakespeare's Verse Construction* (1889).

PRICE, SIR UVEDALE (1747-1829). An English dilettante, born at Foxley, in Herefordshire. He was educated at Eton and Christ Church, Oxford, but did not take a degree. At school and college he formed a close friendship with Charles James Fox, with whom he traveled in Italy and Switzerland, visiting Voltaire at Ferney. He was made a baronet in 1828. Price's principal publication was the *Essay on the Picturesque* (1794; enlarged 1796; completed in 3 vols., 1810). In this famous essay he argued in favor of natural beauty against artificial landscape. Scott followed his views in laying out Abbotsford.

PRICE'ARD, JAMES COWLES (1786-1848). An English physician and ethnologist. He was born at Ross, in Herefordshire, England. He was educated under private instructors, and later studied medicine at Bristol, London, and Edinburgh. His real interests, however, were in ethnology, in which he maintained the theory of the primitive unity of the human race. In addition to his classical studies and the mastery of French, Italian, Spanish, and modern Greek, he devoted himself to Celtic, and was the first to show the Indo-Germanic character of the Celtic group of languages. He published several works on insanity, one of which, his *Treatise on Insanity and Other Disorders Affecting the Mind* (1835), was long a standard work, and was made commissioner in lunacy in London, where he died. Prichard was practically the founder of anthropological science in England. Among his numerous works the most important are: *De Generis Humani Varietate* (1808); *Researches into the Physical History of Mankind* (5 vols., 1836-47); *A Review of the Doctrine of a Vital Principle* (1829); *Eastern Origin of Celtic Nations* (1831); *Different Forms of Insanity in Relation to Jurisprudence* (1842); *Natural History of Man* (1855); and *On the Relation of Ethnology to Other Branches of Knowledge* (1847).

PRICKLY HEAT. The popular name for *miliaria papulosa*, formerly known as *lichen*

tropicus. It is an eruptive skin disease characterized by a large area of small, red, acuminate papules crowded closely together, with excessive sweating, heat, and itching. In tropical countries it is a formidable disease. In this country it is frequently seen in a mild form during hot weather. Carthartics internally, and cooling lotions (such as weak carbolic acid, solution of boric acid, or of bicarbonate of soda) locally, give relief. See MILIARIA.

PRICKLY PEAR, or INDIAN FIG (*Opuntia*). A genus of 200 or more species of cacti, fully half of which occur in the Southwestern United States. Their fleshy, spiny or hairy stems, generally formed of compressed or cylindrical articulations, are leafless, except upon younger shoots, which produce small, cylindrical, early, deciduous leaves. The flowers which spring from among the clusters of pickles, or from the margin or summit of the articulations, are solitary, or corymbose-paniculate, generally yellow, rarely white or red. The fruit, which resembles a fig or pear, with clusters of pickles on the skin, is mucilaginous, and generally eatable. Some species are used for hedge-plants in warm countries. The common prickly pear or Indian fig (*Opuntia vulgaris*), a low-growing native of the Eastern United States, from Massachusetts southward, is naturalized in many Mediterranean and other warm countries. It grows well on rocks, and spreads over expanses of volcanic sand and ashes too arid for almost any other plant. Its yellow or purple tinged oval fruit, somewhat larger than a hen's egg, has a pleasant acid flavor, but is inferior to that of *Opuntia ficus indica* (supposed by some authors to be a form of *Opuntia Tuna*), of which there are many distinct varieties. It is extensively used in many countries as an article of food. The dwarf prickly pear, a variety of *Opuntia vulgaris*, very similar, but smaller, and having prostrate stems, is naturalized in Europe as far north as the sunny slopes of the Tyrol. The tuna (*Opuntia Tuna*), much used in some parts of the West Indies as a hedge-plant, and also valuable as a food of the cochineal insect, has red flowers with long irritable stamens and an edible fruit. *Opuntia Engelmanni* (see Plate of CACTI) is one of the larger flat-jointed species common from Texas westward. From Texas to California and in Mexico are many species with cylindrical stems and upright habit of growth, some attaining a height of 10 feet or more. Some of the thick, fleshy, flat-jointed species are eaten by stock in spite of their spines. Sometimes the spines are singed off to make the plants less difficult to eat. Spineless varieties are grown for the especial use of stock. In the Cape of Good Hope, Australia, and elsewhere the species introduced for stock food have become a serious pest.

PRIDE, THOMAS (?-1658). A soldier during the great Civil War in England of whose early life practically nothing is known. In 1644 he entered the Parliamentary Army as captain, and for a time served under Essex. His promotion was rapid, and he distinguished himself in several of the great battles, notably at Naseby in 1645, where he commanded Harley's regiment. In the quarrel between the army and Parliament he energetically supported the former, and was given command of Harley's regiment. On December 6, 1648, under orders from Fairfax, he

prevented over a hundred members from sitting in the House of Commons, arresting over forty of them, in order to prevent an agreement with Charles I. This incident has gone down in history as Pride's Purge. Pride was a commissioner at the trial of the King, and was one of those to sign the death warrant. He died October 23, 1658. At the Restoration he was attainted, but his body does not seem to have been exhumed.

PRIDE AND PREJUDICE. A novel by Jane Austen (1813), written in 1796. It describes English country life in the family of Mr. Bennett and his five daughters. The plot consists in the overcoming of Elizabeth Bennett's prejudice against Mr. Darcy, her wealthy suitor, and of his pride in his position, the two obstacles to their marriage.

PRIDEAUX, prē'dō, HUMPHREY (1648-1724). An early English Oriental scholar. He was born at Padstow, in Cornwall. He was educated at Westminster School, under Dr. Busby, and at Christ Church, Oxford, where he took the degree of B.A. in 1672. In 1676 he published in Oxford an account of the Arundelian marbles, under the title of *Marmora Ozoniensia*. In 1679 the Lord Chancellor Finch appointed him rector of Saint Clement's at Oxford, and in 1681 a canon at Norwich. In 1688 he became Archdeacon of Suffolk and in 1702 Dean of Norwich. His principal works are his *Life of Mahomet* (1697), which was long very popular, but was inaccurate and is now entirely superseded; and *The Connection of the History of the Old and New Testament* (1715-16). The latter treats with much learning, but less discernment, the affairs of ancient Egypt, Assyria, Persia, Judea, Greece, and Rome, as far as they bear on the subject of sacred prophecy. His life from material supplied by his son was published in London, 1748, and his letters, from 1674 to 1722, to John Ellis were edited for the Camden Society by Thompson (London, 1875).

PRIDEAUX, JOHN (1718-59). An English soldier, born in Devonshire, Eng. He became ensign in the British Army in 1739; took part in the battle of Dettingen in 1743; fought in America against the French; became colonel and brigadier-general; was intrusted by General Amherst with the command of the expedition to reduce Fort Niagara in 1759, and while preparing for the siege was killed in the trenches by the accidental bursting of a shell. For an account of his expedition, consult Parkman, *Montcalm and Wolfe* (Boston, 1884).

PRIDE OF INDIA. See CHINA TREE.

PRIDE'S PURGE. The forcible exclusion in 1648 of over one hundred members from the House of Commons by Col. Thomas Pride (q.v.).

PRIEGO DE CÓRDOBA, prē-ā'gō dā kōr'-dō-nā. A town of Southern Spain in the Province of Córdoba, situated 40 miles southeast of the city of that name (Map: Spain, D 2). It has a very old church and the ruins of an old castle. The chief manufactures are cotton textiles and olive oil. Population, in 1890, 16,745. Priego was an important fortress under the Moors, and was several times captured and recaptured.

PRIENE, prī-ē'nē (Lat., from Gk. Πριήνη). A Greek city of Asia Minor, situated on the north shore of the Latwic Gulf on a projecting

spur of Mount Mycale. The Acropolis and earliest settlement were on a plateau inaccessible except by rock-cut steps, while the later city covered a series of lower terraces. Priene was one of the twelve cities of the Ionian League, and claimed as its founder Æpytus, son of Neleus, though tradition told of a second body of settlers from Beotia, who gave the place in early times the name Cadme. At that time the city was close to the shore and possessed a small but good harbor, which has now been completely destroyed by the alluvial deposits of the Mæander, which have filled the greater part of the ancient gulf. Even in Strabo's time the city was over four miles from the coast, and the distance is now much greater. The city was from an early period involved in a quarrel with Samos about the ownership of lands on Mount Mycale, and inscriptions show that the dispute was not settled until Roman times. It was conquered in the second half of the seventh century B. C. by the Lydian King Ardys, and later, for its support of a Lydian revolt, it was severely treated by the Persians. Its prosperity was renewed by the wise councils of Bias (q.v.), but it again suffered for its participation in the Ionic revolt. Later it came under the rule of the Athenians, and was about B.C. 442 placed by them under the protection of Miletus. During the fifth and fourth centuries it seems to have been of small importance, and its real development took place after Alexander's conquest of Asia. Under his patronage was erected the beautiful temple of Athena Polias, the work of the architect Pythias, who seems also to have laid out the new city on the lower terraces. This temple was excavated by Pullan and Newton for the Society of Dilettanti in 1868, and found to be a masterpiece of Ionic architecture, rivaling in its proportions and finish the Erechtheum at Athens, though with interesting variations in details. The gradual silting up of the bay must have made the place unhealthy, and under the Byzantine emperors the city was deserted. Fortunately, no later settlers were attracted to the site, and thus the ancient houses and buildings fell into ruin, or were destroyed by earthquake and buried in débris.

From 1895 to 1900 excavations were undertaken by the Berlin Museum, and as a result the ancient city has been recovered, and for the Greek town life of the Hellenistic age Priene must take a place similar to that occupied by Pompeii (q.v.) for the life of Italy under the early Empire. The city was planned with great care. East and west, parallel to the mountain-side, ran a series of straight streets, connected at regular intervals by narrow lanes, which ascend the hill. The rectangles thus formed were normally 35 × 47 meters, and contained four houses, whose entrances were on the side streets, so that on the thoroughfares were only blank walls, unbroken save perhaps by windows in the upper stories. The theatre, council house, market-place, temple of Æsculapius, and other public buildings were also laid bare, and a wealth of inscriptions and smaller objects recovered. No complete publication of the results has yet (1903) appeared, but preliminary reports may be found in the *Archäologischer Anzeiger* published in the *Jahrbuch des archäologischen Instituts* (Berlin, 1900). A popular account by A. L. Frothingham was published in the *Century Ma-*

gazine, vol. lxii. (New York, 1901). For the temple of Athena Polias, see Pullan and Newton, *Antiquities of Ionia*, published by the Society of Dilettanti (London, 1881). For the ancient history, see Lenschau, "De Rebus Priensibus," in *Leipziger Studien*, vol. xii., 1890.

PRIESSNITZ, prēs'nīts, VINCENZ (1799-1851). The founder of hydrotherapy. He was born at Gräfenberg, in Austrian Silesia, and at first devoted himself to farming. It appears that a neighbor, who had been in the way of healing trilling wounds on himself and others by means of cold water, treated Priessnitz in this way for a serious injury from the kick of a horse; and having had his attention directed to the virtues of cold water, Priessnitz, indisputably possessed of sharpness of intellect and some aptitude for the practice of the healing art, began to cure ailments with cold water, and soon attained considerable reputation. As the number of applicants for advice went on increasing, he gradually came, by experiment, to form a system of treatment for the various cases presented. Opposition to him on the ground of unlicensed practising gave way before special authority from the Austrian Government, and in 1822 the Gräfenberg water-cure was established. In 1829 there were 49 patients, and in 1837 the number had risen to 586. In 1833 Priessnitz abandoned farming in order to devote himself to the care of the establishments which he had to provide for the reception and treatment of his patients. See **HYDROTHERAPY**. Consult: Philo von Walde, *Vincenz Priessnitz als Begründer des Wasser- und Naturheilverfahrens* (Berlin, 1897).

PRIEST (AS. *prēost*, OF. *prestre*, Fr. *prêtre*, priest, from Lat. *presbyter*, elder, presbyter). The title, in its most general signification, of a minister of public worship, but specially applied to the minister of sacrifice or other mediatorial offices. In the early history of mankind there is no priest. Such a state of affairs may be seen to-day in Central Australia, where, although there are many religious observances, there are no priests of any kind. A secondary stage is that of the Shamanistic Altaic tribes, whose religion is a spirit-worship and whose priests are called Shamans. The Shaman may believe in the existence of a supreme god, but he and his co-religionists pay attention only to the evil spirits whom alone they reckon with. The Shaman priest is a conjurer, an exorciser, and goes clad with amulets and charms of various sorts. He is called in to aid the afflicted as well as to rout devils, and so approaches the position of a medicine-man. The latter, however, as represented by the redskins, is a priest in a community that recognizes higher divinities than evil spirits and pays worship to gods without the help of the medicine-man. One step higher, and a patriarchal form of society invariably evolves the family priest, the head of the family, who represents them before the gods by performing sacrifice. From this to the clan chief priest and royal priest is but a series of steps in the same direction. Thus the Akkadian matriarchal state of society produced priests who were just such Shamans as to-day represent priesthood among the Finns and Samoyeds, while the patriarchal Aryans had as far back as we can trace them the father-priest.

The chief formal priesthoods of antiquity, certainly those most elaborately developed, were those of the Hebrews, the Egyptians, and the Hindus. Compared with these, the priests of Greece and Rome formed a less compact social organization. — (See GREEK RELIGION; ROMAN RELIGION.) The early Babylonian priests were little more than exorcisers. They attained their greatest dignity when their office was amalgamated with that of the king. They presided over sacrifice and offered libations, but with the common people they were chiefly renowned as devil-tamers and sorcerers. In course of time a priestly caste was developed, but it lacked the homogeneity and power of the Hindu priestly caste. Another powerful priesthood was that of the sun-god of the Aztecs, but this was a hierarchic power assumed from the beginning by the king, who was the high priest of the nation, all his family being regarded as sacred to the sun, the women of the king-priest being vestal virgins sacred to the god and king. The development of the priest and different ideas associated with his office are illustrated by the following account of the priesthood among the Hebrews, ancient Egyptians, and Hindus.

THE HEBREW AND JEWISH PRIESTHOOD. The Hebrew word for priest (*kōhēn*) is of uncertain origin; the Arabic *kāhin* means diviner, which corresponds to one of the most distinctive functions of the priesthood. According to the later Jewish theory, the priesthood belonged exclusively to the family of Aaron, while the remainder of the tribe of Levi held but the subordinate position of attendants at the sanctuary. But the examination of the historical records proves that this limitation of priestly prerogative was of late origin. The earlier strata of the historical books exhibit sacrifice as the right of all, especially of the heads of families. (Cf. the histories of the Patriarchs, and of Manoh and Micah, Jud. xiii., xvii., xviii.) Particularly was this the prerogative of national and religious leaders, of prophets like Samuel (I. Sam. xvi.) and Elijah (I. Kings xviii.), and of princes like David (II. Sam. vi., where he is clothed with the priestly ephod) and Solomon (I. Kings viii.; cf. ix. 25). Also David's sons are said to have been priests (II. Sam. viii. 18). But from the beginning of the national history there existed a family or caste to which the priesthood was a profession—the so-called tribe of Levi. Moses' institution of the ark required its ministers, and either he established a priestly caste, or, as is more probable, inasmuch as he belonged to the same family, he made use of an already existing caste. The part his brother Aaron played is obscure, but there is no reason to doubt that he exercised some special priestly functions.

The *locus classicus* for the position of the Levites in the early history is the story of Micah (see above), where, while a Levite is not necessary, he is much preferred; the Levite in question appears to be a grandson of Moses (Jud. xviii. 30, R. V. (See GERSHOM.) Again, the priest at the ark in Shiloh is Eli, of the line of Ithamar, son of Aaron; doubtless this connection gave the Levites a prerogative in priestly functions, of which they were enabled to take advantage upon the settlement of the ark in Jerusalem, and especially upon the building of the Temple by Solomon. From this time on, it

would seem, the sacerdotal functions of the religion of Yahweh in the Southern Kingdom came gradually to be monopolized by the Levites. The prestige of the Temple naturally tended in Judah to the exaltation of a special religious caste throughout that land. As for the kingdom of Israel, it is not stated (except in the doubtful passage I. Kings xii. 31) whether the priests belonged to the Levites or not; at all events, the prophets find no fault with their sacerdotal character. During the monarchy hierarchic grades arose; thus Abiathar of the line of Ithamar is the leading priest under David, to be dispossessed under Solomon by Zadok of the line of Eleazar. With the expansion of the caste and the growth of the sacred ritual, differentiations in office ensued, which resulted in the sacrificial functions being reserved for 'the sons of Aaron,' the remaining Levites, including Moses' descendants, being degraded to lower ministries. In Ezekiel's ideal sketch of the restored theocracy, the priesthood is confined to 'the sons of Zadok,' but in Chronicles the line of Ithamar is admitted, the high-priestly descent remaining, however, in the former family. The Restoration immensely exalted the position of the priesthood, especially of its chief. (Cf. Zech. iii., vi.) But it possessed no political force and little spiritual stimulus, so that it became a close corporation, intent upon enjoying and increasing its temporal privileges, leaving the development of religion in the hand of more popular leaders. The priesthood was raised to its highest honor through the assumption of the monarchy by the priestly Maccabean family, so that for seventy years a priest-king ruled Israel. (See MACCABEES.) With the fall of the Maccabean kingdom and the destruction of that family by Herod, the priesthood fell back to its conventional position, becoming the tool of the Romans, who made and unmade the high priest. (Cf. Annas and Caiaphas in the Gospels; also Acts xxiii. 2 sqq.) It had a small but strong party behind its back in the Sadducees (q.v.), so named after the above-mentioned Zadok. With the destruction of the Temple in A. D. 70 the priesthood ceased, as sacrifice was no longer legitimate. The tradition of the ancient caste is still faintly preserved in certain Jewish families.

As for the functions of the priesthood, in addition to the sacrificial acts, which were accompanied with blessing and prayer, there was the important office of the divine oracle, for which the instrument of Urim and Thummim (q.v.) was used, in all kinds of questions. (Cf. the histories of Saul and David.) Also the priests at the various sanctuaries possessed the right of giving the *torah* or instruction of God in all matters. (Cf. Deut. xvii. 8 sqq.) With the codification of the law, the teaching function passed from the priests to the more zealous lay expounders, the Scribes (q.v.). The support of the priests came in earlier times directly from the worshipers; they had the right to certain portions of the sacrifices, to the tithes, and other offerings. (Cf. I. Sam. ii. 12 sqq.; Neh. x. 32 sqq.) Later there was established a more definite provision for the support of the Temple and its priests in a poll-tax levied upon all Jews. (Exod. xxx. 13; Neh. x. 32; cf. Matt. xvii. 24, R. V.) The number of the priests grew to vast proportions, according to Josephus over 20,000, and

they were divided into 24 classes (I. Chron. xxiv.), the individuals coming up to Jerusalem at their appointed seasons. (Cf. Luke i.) The priests alone had access into the Holy Place, the high priest alone into the Holy of Holies. For the dress of the priests, see Exod. xxviii.; for general regulations, Levit. xxi., and *passim* in the Priestly Code. Consult the works mentioned in the article LEVITES; and Schürer, *History of the Jewish People* (Edinburgh, 1885-90); Wellhausen, *Prolegomena zur Geschichte Israels* (4th ed., Berlin, 1895). See AARON; LEVITES; HIGH PRIEST.

THE EGYPTIAN PRIESTHOOD. From the earliest times each Egyptian nome had its own local cult administered by a priesthood who formed a sort of collegiate body and were divided into several classes. The most numerous, and at the same time the highest, class were the priests called by Egyptians *hen nuter*, or 'servants of the god.' Their functions are not very clearly defined, but it would seem that they conducted the temple services with the aid of the inferior clergy, and delivered the oracles of the god. The duty of the *kheri-heb* (i.e. 'he with the book') or 'reciter priest' was to recite from the ancient sacred books, and he usually officiated at funerals, where he read over the deceased the appropriate chapters of the Book of the Dead (q.v.). As these old religious texts were believed to possess magical powers, the *kheri-heb* came to be regarded by the people as a magician. Lowest in order of rank stood the *we'b*, a name which signifies 'pure.' The *we'b* was required to examine into the purity of sacrificial animals before they were laid upon the table of offerings; he also poured out drink offerings and performed the rites of ceremonial purification by sprinkling with holy water. At the head of the priestly college of each nome stood the chief prophet or high priest, who in some localities bore a distinctive title. Thus the high priest of Memphis was called the 'Master Craftsman,' and the high priest of Heliopolis was the 'Great Seer' or 'He who sees the secrets of Heaven.' Under the Old and Middle Empires membership in the local priestly guild was hereditary, and the office of chief prophet was usually, though not necessarily, held by the ruling nomarch. During this period brotherhoods of pious laymen, termed *Unnut*, or 'hour-priests,' were attached to the various temples. Each member devoted a certain portion of his time to the temple services and the association took part in a body on stated occasions. Nobles and high officials usually held one or more priestly offices, but it is probable that in the majority of cases their duties were more or less perfunctory. The funerary chapels attached to the tombs of important personages were served by priests entitled 'servants of the Ka' (*hen ka*), and in the temples connected with the pyramids of Egyptian kings the worship of the deceased monarchs was conducted by priests styled 'prophets of the pyramid.'

Under the New Empire the position of the priesthood changed considerably, though to a less extent in the smaller country temples and in the ancient sanctuaries than in the great temples of the new capital, Thebes. The priesthood of Ammon, which may be considered as fairly representative of the later period, contained five gradations of rank: the first, second, and third

prophets, the divine father, and the *we'b*. The high priest or first prophet of Ammon held a very exalted position; he not only directed the affairs of the great national sanctuary, at the head of which he stood, but also exercised a sort of pontificate over all the temples of Egypt. The second prophet of Ammon had, among other duties, the superintendence of the artists belonging to the temple, and the *we'b* officiated as 'reciter priest.' The priestly office was no longer hereditary, as in the older period, and though the sons of priests often followed their fathers' profession, this was largely due to personal or family influence. A young man might be appointed to the priesthood in his fifteenth or sixteenth year, and his subsequent progress depended upon his abilities and upon the influence he could exert.

Priests of all classes were bound to observe rigid personal cleanliness. They shaved their heads, wore pure linen garments, and, in case of contact with anything ceremonially unclean, must perform the necessary rites of purification before they could exercise their sacred functions. Under the Old Empire they do not seem to have worn a characteristic dress, but in the time of the New Empire the ecclesiastical costume is quite distinctive. The details of the dress varied with the rank and functions of the wearer, but all wore a white linen skirt of ancient fashion. Some wore over this a wide cape which hung from just below the armpits, while others enveloped the body in a great cloak. Certain priests officiating at funerals are represented as wearing a panther skin, and the high priest of Heliopolis wore a panther skin dotted with stars, in allusion to his title of 'He who sees the secrets of Heaven.' The high priest of Memphis wore about his neck a curious necklace of elaborate design, and judges, who were all priests of *Mat*, wore an image of the goddess when on the bench.

In the older period noble ladies frequently bore priestly titles; they were usually prophetesses of Neith or Hathor, though to what extent they actually took part in the temple services is difficult to say. It is probable that such titles were chiefly honorary. Under the New Empire women of all ranks were connected with the various temples, especially that of Ammon of Thebes, as singers or musicians. They were regarded as forming the harem of the god and held different degrees of rank. Certain women of high rank, for example, bore the title of 'chief concubine' of the god, and at the head of the mystical harem of Thebes stood the 'legitimate wife of the god,' usually the Queen herself, who represented the goddess Mut, the heavenly consort of Ammon.

Connected with the Serapeum (q.v.) of Memphis and with other temples of Serapis in Egypt was a regularly organized monastic system. The monks lived in cells, which they were not permitted to leave, and received their food through air-holes in the wall, their sole channel of communication with the outer world. They called each other brethren, and sought by pious meditation to overcome their passions and attain a condition of insensibility to external impressions. Consult: Brugsch, *Aegyptologie* (Leipzig, 1891); Wilkinson, *Manners and Customs of the Ancient Egyptians* (London, 1878); Erman, *Life in An-*

cient Egypt (London, 1894); Deveria, *Monument biographique de Bakenkhonsou* (Paris, 1862). See also EGYPT.

THE HINDU PRIESTHOOD. The priesthood of India belongs to the first or Brahman caste exclusively. The growth of a priest caste can be traced in the history of Hindu literature. Originally a king, or pater-familias, whether of priestly caste or not, could officiate as a priest. Any defective knowledge on the part of a priest or any defective performance by him of the sacrificial rites was supposed to entail upon him the most serious consequences both in this life and in the future. As the duration of a Hindu sacrifice varies from one day to a year, or even more, the number of priests required at such a ceremony likewise varied. Again, as there are sacrificial acts at which verses from the Rig-Veda only were recited; others requiring the inaudible muttering of verses from the Yajur-Veda only; others, again, at which verses only of the Sama-Veda were chanted; and others, too, at which all these three Vedas were indispensable—there were priests who merely knew and practiced the ritual of the Rig-Veda, or the Yajur-Veda, or the Sama-Veda, while there were others who had a knowledge of all these Vedas and their rituals. The full contingent of priests required at a great sacrifice amounts to sixteen. Other inferior assistants, such as the ladle-holders, slayers, choristers, and the like, are not looked upon as priests. From one to four priests sufficed at the minor sacrifices, or those of daily occurrence. These were the rules and practices when the Hindu ceremonial obeyed the canon of the Vedic ritual; and the latter probably still prevailed at the epic period of India, though many additions to it are perceptible in the *Mahābhārata* (q.v.) and *Rāmāyanā* (q.v.). But at the Puranic period, and from that time downward, when the study of the Vedas had fallen into disuse, almost every Brahman not utterly ignorant became qualified to be a priest.

By a sort of historical retrogression to early conditions, in the latter-day sects of the Hindus it was not even necessary that a priest should be a Brahman. He might be of any caste, and priestesses as well as priests were permitted. The radical difference between the Vedic and Puranic ritual was in the abolition on the part of the latter of the Vedic service and in the method of slaughtering the sacrificial victim. In Vedic rites the victim is throttled; in Puranic rites its throat is cut, or very often no victim at all is offered, only vegetable offerings being made. The Puranic rites required no knowledge of the Vedas whatever. For the priesthood of the Buddhists, Jains, and Tibetans, see BUDDHISM; JAINAS; LAMAISM.

In the history of the Christian Church the question of the existence of a priesthood properly so called has given rise to fundamental divisions. On the one hand, Roman Catholic theologians contend that the Apostles were definitely made by Christ partakers of His mediatorial priesthood, with power to hand it down to their successors (see John xx. 21), and assert that from the date of this commission there has been an unbroken tradition of sacerdotal power, whose most important function is the offering of sacrifice for the living and the departed (see MASS); that the Christian ministry is as truly

a priesthood as that of the Jewish law, though with higher functions. There is a sense in which they admit this priesthood to be shared by the whole body of the faithful; but its specific exercise they claim is strictly limited to those who have been set apart by episcopal ordination. The Protestant bodies generally deny the existence of any such class or powers, and have therefore usually abandoned the use of the word 'priest,' substituting for it 'presbyter' or 'minister'—though Milton, dissatisfied with the thoroughness of the English Reformation, complained that "New presbyter is but old priest writ large." See ORDERS, HOLY; BISHOP; APOSTOLIC SUCCESSION.

PRIESTLEY, JOSEPH (1733-1804). An English clergyman and scientist. He was born at Fieldhead, near Birstall, in Yorkshire, the son of Jonas Priestley, a woolen cloth dresser. At six years of age, owing to his mother's death, he was adopted by his father's sister. He gave every evidence of an aptness for languages, studying Latin and Greek at school and Hebrew under a clergyman. Later he mastered Italian, French, and German himself, and ultimately acquired Chaldee and Syriac. He also had a mathematical mind and was given to scientific research. He was brought up a Calvinist; but as he grew older and began to think for himself he appears to have resented the Calvinist doctrine of original sin, which was synonymous with total depravity. In his twentieth year he was sent to the Non-conformist Academy at Daventry, where he remained three years. While there he joined freely in the theological discussions which prevailed, and found himself on every occasion on the heterodox side of the questions at issue. He next announced himself a necessitarian and finally became a Socinian and denied the divinity of Jesus Christ. Despite his unorthodox views, however, and a serious impediment in his speech, he sought the ministry, beginning at 22 years of age with a small congregation at Needham Market, in Suffolk. While there, he wrote *The Scripture Doctrine of Remission*, which was published in 1761. From Needham he went to Nantwich, and from there to Warrington, where he was appointed a teacher of languages and belles-lettres in a Nonconformist academy. Here he married and spent six of the happiest years of his life. The University of Edinburgh gave him an honorary degree in recognition of his literary work and he became acquainted with Franklin and Price.

He now manifested another side of his nature. Chemistry was then unborn, but Priestley, living next door to a brewery in Leeds, where he had removed to take charge of Mill Hill Chapel, became interested in the production of carbonic acid and succeeded in forcing it into water. He also wrote a *History of Electricity* and afterwards published political tracts and papers, some of which were opposed to the Government's attitude toward the American colonies. In 1772 he became librarian and "literary companion" to Lord Shelburne at a salary of £250 a year, and in 1774 he accompanied him on a Continental tour in France and Germany. About this time he wrote the *Letters to a Philosophical Unbeliever* and other works criticising the doctrines of Hume and others. He also made the discovery of oxygen and other gases, which gave him his scientific

reputation. In 1777 he published his *Disquisition Relating to Matter and Spirit*. This led to the severance of his relations with Lord Shelburne, and in 1780 he became the minister of a dissenting chapel at Birmingham. Here he made the acquaintance of James Watt and Dr. Darwin, the grandfather of the famous author of the *Origin of Species*, and here he had his celebrated controversy with Bishop Samuel Horsley, in which he was the recognized champion of Socinianism. His reply to Edmund Burke's *Reflections on the French Revolution* led to his being made a citizen of the French Republic and unhappily resulted in his house and chapel being burned by a mob and all his books, manuscripts, and scientific instruments being destroyed. This occurred in 1791, and because of the attack he left Birmingham and took up ministerial work at Hackney, London. He preached there for three years, and then, in 1794, removed to America, whither his sons had emigrated the year before. He settled at Northumberland, Pa., and spent the rest of his life there. He preached and lectured occasionally, but his services were not in great demand and his oratorical powers were failing. He declined the offer of a professorship of chemistry at Philadelphia, and later the principalship of the University of Pennsylvania. Most of his time was spent with his books and in scientific experiment, and he continued to write liberally till the hour of his death, although his later years were clouded by the physical infirmities of age. He died February 6, 1804.

Priestley was in many ways a remarkable man. He presented the unusual combination of theologian, scientist, and politician. His manifold and varied publications gave evidence of the scope of his genius. His pen was untiring. In religion and in politics he was a radical, but he was a sincere seeker after truth and a man of unblemished reputation and irreproachable moral character. His *Theological and Miscellaneous Works* and *Memoirs and Correspondence* were collected and edited by John T. Rutt, the former in 26 vols. (London, 1817-32), the latter in 2 vols. (ib., 1831-32). The edition contains over one hundred and thirty separate works, varying in size from short pamphlets to four-volume treatises, and the subjects treated of cover almost the whole ground of human knowledge and speculation.

PRIESTLEY, Sir WILLIAM OYEREND (1829-1900). An English obstetrician, a grand-nephew of Joseph Priestley. He was born near Leeds, studied at King's College, London, in Paris, and at the University of Edinburgh. In 1856 he settled in London, where for ten years (1862-72) he was professor of obstetric medicine at King's College, and from 1866 to 1876 was examiner in midwifery at the English Royal College of Surgeons. Priestley was knighted in 1893 and entered Parliament in 1896 as representative of Edinburgh and Saint Andrews. Following his master Simson, whose works he edited (1855-56), he devoted himself to the systematization of midwifery and largely contributed toward raising it from a position of mere empiricism.

PRIETO, pré-ã'tò, JOAQUIN (1786-1854). A Chilean politician, born at Concepcion. Although at first a Royalist, he took the patriot side in 1811, and was one of the foremost in the fight for independence. In the Civil War of 1829-30 he

defeated Friere at the Battle of Lircay (1830) and was made provisional President of Chile. This appointment was ratified six months afterwards, and he was reelected President in 1836. In the same year a war with Peru was begun in which Chile assisted the dissatisfied Peruvians to overthrow the Peruvian-Bolivian Confederation. General Prieto was commandant at Valparaiso at the time of his death.

PRIG, BETSEY. An ignorant, brutal nurse, the friend of Mrs. Sarah Gamp, and her "frequent pardner," in Dickens's *Martin Chuzzlewit*.

PRIGG VS. PENNSYLVANIA. An important case decided in 1842 by the Supreme Court of the United States, which defined the rights and duties of the various States with reference to the rendition of fugitive slaves. In 1826 Pennsylvania passed a law against kidnapping which imposed severe penalties upon any one who should remove any negro from the State with the intention of reducing or returning such slave to a condition of slavery. In 1837 a slave woman, Margaret Morgan, who five years before had escaped from her owner in Maryland into Pennsylvania, was seized by one Edward Prigg, the attorney of her owner, and, together with her children, was delivered to her mistress. Prigg was thereupon tried and convicted of kidnapping in the court of Yorke County, Pa., and the decision of this court was confirmed by the Supreme Court of Pennsylvania, to which Prigg appealed. The case was then carried before the Supreme Court of the United States which, by a vote of five to four, reversed the earlier decisions, and, among other things, decided (1) that by the Constitution the National Congress had the exclusive right to legislate concerning the rendition of fugitive slaves; (2) that the Legislatures of the various States had no power to pass legislation upon this subject; (3) that Pennsylvania's law of 1826 was therefore void; (4) that "the owner of a slave is clothed with entire authority in every State in the Union to seize and recapture his slave, whenever he can do it without any breach of the peace, or any illegal violence;" and (5) that no State could be compelled to aid the enforcement of a United States law on this subject. Though the right of slave-owners to their fugitive slaves was unequivocally confirmed, this decision has been regarded by many as in one respect a "triumph of freedom," since it relieved the various free States of any necessary participation in the catching and returning of fugitive slaves and encouraged them to pass laws, known as "Personal Liberty Laws," prohibiting all State officials, under heavy penalties, from aiding slave-catchers in any way and forbidding the use of State jails for the detention of captured fugitives. Consult Thayer, *Cases on Constitutional Law*, vol. i. (Boston, 1894); and 16 *Peters* 539.

PRILLIEUX, pré-yè', ÉDOUARD ERNEST (1836-). A French botanist, born in Paris. In 1877 he was appointed professor of botany at the Institut National Agronomique; in 1883 he was made inspector-general of agriculture, and in the same year became an officer of the Legion of Honor. His publications include articles on vegetable parasites, contributed to various French periodicals, and *Maladies des plantes agricoles et des arbres fruitiers et forestiers* (1895-97).

PRILUKI, præ-lōŭ'kâ. A district town in the Government of Poltava, Russia, situated 145

miles northwest of Poltava (Map: Russia, D 4). It has a considerable milling industry, and trades in the agricultural and animal products of the neighborhood. Population, in 1897, 19,055.

PRIM, *prém*, **JUAN**, Marquis de los Castillejos, Count of Reus (1814-70). A Spanish general and statesman. He was born in Reus, Catalonia, December 6, 1814, entered the army at an early age, rendered Narvaez (q.v.) efficient assistance in securing the downfall of Espartero in 1843, and was made a count. He was active in bringing about the return of Queen Christina, but in 1844, on account of his defection from Narvaez, was sentenced to imprisonment on a charge of conspiracy against the latter's life. In 1845 he was pardoned by the Queen, who made him Governor of Porto Rico. He led the progressive party in the Cortes (1848-53), was in exile 1853-58, and served in the campaign in Morocco in 1859-60. For his victory at Los Castillejos, January 1, 1860, he was made a marquis. In 1862 he was commander of the Spanish troops in Mexico, despatched to act in conjunction with the French and English forces, but disapproving of the plans of the Emperor Napoleon, he returned to Spain, where the Cortes sanctioned his course. In 1864 he was driven from Madrid, accused of participating in a military conspiracy, and in 1866 he began an unsuccessful insurrection against the Government of O'Donnell (q.v.), and was forced to flee to England. In 1868 he joined Serrano in the revolution which dethroned Isabella. In the provisional Government (October) Prim became commander-in-chief, Minister of War, and president of the Council. He was responsible for the choice of Prince Leopold of Hohenzollern to fill the vacant throne, a choice which brought on the Franco-German War (q.v.). Afterwards, through his agency, Amadeus I. (q.v.) was called to the throne. Prim was shot by an assassin December 28, 1870, and died from his wounds on the 30th, before Amadeus arrived in Madrid. Consult: Guillaumot, *Juan Prim et l'Espagne* (Paris, 1870); Blairet, *Le général Prim et la situation actuelle de l'Espagne* (Paris, 1870).

PRIMARY ELECTIONS (Lat. *primarius*, relating to the first or earliest, from *primus*, first, from *pro*, before; connected with Gk. *πρό*, *pro*, Skt. *pra*, Goth. *faür*, OHG. *fora*, Ger. *vor*, AS., Eng. *for*). The term used to designate the means through which candidates for elective offices are nominated. In a more restricted sense it refers to the election of delegates to nominating conventions (q.v.). A primary election differs from a regular election in that it is participated in only by the members of a particular political party. Thus there are Democratic primaries, Republican primaries, etc., at each of which the party convention is chosen or the party candidates are nominated directly. Until recently the primary election was a wholly extra-legal institution, that is, it was unregulated by statute. Each party framed its own rules and devised its own machinery for the selection of its candidates without legal restriction. The theory was that whatever political action antedated the election was beyond the domain of law, and hence the manner in which each party brought forward its candidates was to be determined by its own action. Every proposal to place the primary under the supervision of the State was attacked as a

species of despotism repugnant both to the liberty of parties and to the private rights of politicians. For a long time the non-officially conducted primary was the source of little or no abuse, but with the enormous growth of the city population and the complexity of political life in general the opportunities for fraud and corruption multiplied so that in many communities, especially in the larger cities, the primary degenerated into a confederation of selfish partisan associations from which a large majority of the voters were excluded. Thus in the city of New York the primary organizations came to be clubs with such rigid tests for membership that the number of members did not exceed one-fourth of the party voters, and in some cases was not more than one-sixth. Moreover, the party regulations did not afford sufficient means for identifying the voters of a given organization, with the consequence that the voters of one party could and sometimes did participate in the primaries of another party for the purpose of bringing about the nomination of unpopular candidates, with the hope of defeating them in the regular election. As a result of these conditions the demand for primary reform increased, and within the last decade laws have been passed in most of the leading States, including Minnesota, Nebraska, Ohio, New Jersey, Pennsylvania, Georgia, Kentucky, Mississippi, South Carolina, Texas, Wisconsin, Michigan, Missouri, Maryland, Massachusetts, California, Illinois, and New York, for the purpose of regulating primary elections and placing them under the supervision of the State.

In general these laws provide that sufficient public notice shall be given; that the elections shall be by ballot; that the election officers shall be sworn; that the expense of conducting the primaries shall be borne by the State, or, in some cases, as in Mississippi, by the candidates; that frauds shall be punished according to prescribed penalties; and that these requirements shall be compulsory in the large cities and optional elsewhere. A few of the most recently enacted statutes go even further and provide methods for securing, prior to the primary election, a fair and full enrollment of the voters of each party; for a proper test by which to determine who shall be considered a member of a particular party; for fixing a uniform primary election day; for using the 'blanket' form of ballot; for direct nomination of candidates, or, if through a convention, by delegates chosen by a pledging ballot at the primary; and for various regulations with regard to the organization and action of the convention. So far the most comprehensive and thorough-going measure of the kind is the primary election of Minnesota. Its distinguishing features are that it is compulsory; that it is general, applying to the nomination of county, municipal, and judicial officers and Representatives in Congress; that the elections for all parties are held on the same day as in the case of general elections; and that primary election day is also the first day for the registration of voters for the general election. The New York primary election law is equally thorough-going in several particulars. In Mississippi all nominations for State, district, county, and local officers are now made by primary election in accordance with the law governing the general election, but under the supervision of party committees. The general result of this legislation is to elevate the so-called primary to

the dignity of a preliminary election and surround it with the safeguards of law. It is undoubtedly a great step in the direction of purity of elections. See CAUCUS; CONVENTION; ELECTIONS.

PRIMARY QUALITIES. Those qualities which are in some systems of philosophy supposed to belong to the object as it is in itself; its antonym is secondary qualities, which are supposed to belong to the object only as it appears in consciousness. Various lists of primary qualities have been given. Locke's list includes: "Solidity, extension, figure, motion or rest, and number." The distinction between primary and secondary qualities cannot be consistently maintained, for the reason that the qualities of the thing-in-itself, even if there were such a thing, could never be known. See KNOWLEDGE, THEORY OF.

PRIMATE (Lat. *primas*, chief, from *primus*, first). A title in some of the Christian churches applied to a bishop as first in a province or group of provinces. A metropolitan is a primate as presiding in his province, or one of several metropolitans as presiding over others. The title does not seem to have come into ordinary use until the ninth century, after which it was given to the metropolitans of certain sees as the special representatives of the Pope. It strictly belongs to the Latin Church, but in its general use it corresponds with that of exarch in Eastern churches. In early usage the primate, as such, was the head of a particular Church or country, and held rank, and in some churches a certain degree of jurisdiction, over all the archbishops and bishops within the national Church. This jurisdiction, however, was confined to the right of visitation and of receiving appeals. In Africa the Bishop of Carthage, without the title, possessed all the rank and authority of a primate. The chief primatial sees of the Western Church have been: in Spain, Seville and Tarragona, afterwards united in Toledo; in France, Arles, Rheims, Lyons, and Rouen (the Archbishop of Lyons claiming the title of *primat des primats*); in England, Canterbury and York; in Germany, Mainz, Salzburg, and Treves; in Ireland, Armagh, and for the Pale, Dublin; in Scotland, Saint Andrews; in Hungary, Gran; in Poland, Gnesen; and for the Scandinavian countries, Lund. In England, as a settlement of the quarrels between Canterbury and York, the Pope designated the Archbishop of Canterbury as primate of all England, while the Archbishop of York was to be known as primate of England.

The title of primate is also given to several bishops of the Church of England in the British colonies. In the Episcopal Church of Scotland the title *primus* is given to the presiding bishop. He is chosen by vote of all the bishops without their being bound to give effect to seniority of consecration or precedence of diocese. See METROPOLITAN; PATRIARCH.

PRIMATES (Lat., chiefs). The highest order of mammals, including man, monkeys, and lemurs (qq.v.). They are characterized by the presence of well-developed clavicles, two pectoral mammae, and orbits directed forward, encircled by bone and shut off from the temporal fossae. The innermost digit of the hands and feet are usually opposable to the others; this is always so in at least one pair of limbs. The terminal joints of the digits bear flat nails, rarely claws. The incisor teeth are typically two in each jaw, direct-

ly in front, and canine, premolar, and molar teeth are also present. The brain (except in lemurs) exhibits a high type of structure, the cerebrum being very large and covering the cerebellum, and the surface of the former is much convoluted. Excepting man, the Primates are arboreal forms and are peculiarly well fitted for such a life. The tail is often long and sometimes prehensile. They are mostly small or medium-sized animals, though some of the anthropoid apes are large. They are omnivorous eaters, but fruit, berries, and other vegetable matter form a large part of their diet. The order is easily divided into two distinct sub-orders, the *Lemuroidea* and *Anthropoidea*, the former containing only lemurs and their near allies, spectres, pottos, aye-ayes, etc. (qq.v.), while the latter includes all the marmosets, monkeys, baboons, apes, and man (qq.v.).

PRIMATICCIO, prĕ'mā-tĕt'chō (called by the French "Le Primaticcio"), FRANCESCO (1504-70). An Italian painter. He was born in Bologna, and was the pupil of Innocenzo da Imola and Bagnacavallo, but was mainly influenced by Giulio Romano, his next master, whom he assisted in the decorations of the Palazzo del Te, in Mantua. In 1532 he was called by Francis I. to France, and with Rosso was employed at Fontainebleau. When Rosso died, Primaticcio took his place as director of works there. Before Francis's death Primaticcio had executed his most important frescoes in the Gallery of Ulysses at Fontainebleau, which were destroyed when the palace was remodeled in 1738. Under Henry II., Francis II., and Charles IX., he gained in fortune, and in 1554 he was made Abbé of Saint Martin of Troyes. Catharine de' Medici appointed him Court architect. In this capacity he made designs for the Valois tombs at Saint-Denis. During the years he spent at the Court of France his taste formed the so-called "school of Fontainebleau." He introduced Italian mannerism and so gave France that love for things Italian which predominated its art for more than two centuries.

PRIME. See BREVARY.

PRIME, EDWARD DORR GRIFFIN (1814-91). An American clergyman and journalist. He was born at Cambridge, N. Y., and graduated from Union College in 1832. He studied at the Theological Seminary at Princeton, where he completed the course in 1838. After some years with the Presbyterian Church of Scotchtown, N. Y., in 1849 he went to New Orleans for the benefit of his health, and then assumed the pastorate for a year of the Presbyterian Church in Eighty-sixth Street, New York City. In 1853 he became substitute editor of the *New York Observer*, while his brother, Samuel Irenæus, was in Europe. After the brother's return the two maintained an editorial association until 1885. He continued to edit the paper for a year after his brother's death. He made several extended journeys abroad, spent the winter of 1854-55 in Rome, and made a journey round the world in 1869-70 with the special object of studying the religious condition of Eastern countries. He published: *Around the World* (1872); *Forty Years in the Turkish Empire; or Memoirs of Rev. William Goodell* (1876); *Civil and Religious Liberty in Turkey* (1875); and *Notes, Genealogical, Biographical, and Bibliographical, of the Prime Family* (privately printed, New York, 1888).

PRIME, SAMUEL IRENÆUS (1812-85). An American clergyman, traveler, and writer. He was born at Ballston, N. Y., and graduated from Williams College in 1829. Three years later he entered Princeton Theological Seminary, but a severe illness compelled him to abandon his theological course in the first year. He was licensed to preach by the Presbytery of Bedford in 1833, and in 1835 was installed pastor of the Presbyterian Church at Ballston Spa, N. Y., but again illness compelled a change of occupation and he became principal of the academy at Newburgh, N. Y. He resumed preaching in 1837, being located at Matteawan, N. Y., but three years later entered upon the chief work of his life as editor of the *New York Observer*, a paper of which he afterwards came to be the principal owner. He was for a time one of the secretaries of the American Bible Society, a corresponding secretary of the Evangelical Alliance, the founder and president of the New York Association for the Advancement of Science and Art, president and trustee of Wells College, and a trustee of Williams College. He died at Manchester, Vt. Besides a large number of books of religious character he published: *Life in New York* (1846); *Travels in Europe and the East* (1855); *Letters from Switzerland* (1860); *The Power of Prayer* (1858); *American Wit and Humor* (1859); *The Alhambra and the Kremlin* (1873); *Life of Samuel F. B. Morse* (1875); *Irenæus Letters* (1880, 1885).

For his life, consult the autobiography in *Irenæus Letters*, series ii. (New York, 1885), and the sketch with bibliography in *Notes Genealogical, Biographical, and Bibliographical of the Prime Family*, by E. D. G. Prime (privately printed, New York, 1888).

PRIME, WILLIAM COWPER (1825—). An American journalist, born at Cambridge, N. Y. He graduated at Princeton in 1843, was admitted to the bar three years later, and practiced law in New York City until 1861, when he became part owner and editor-in-chief of the *New York Journal of Commerce*. In 1869 he gave up his editorial work and revisited Egypt and Palestine, where he had spent some time in 1855-56. He was a lover of art and in 1884 induced the authorities at Princeton to establish a chair of the history of art, of which he became the first incumbent. His interest in this subject brought him into close connection with the Metropolitan Museum in New York, of which he was first vice-president after 1874. He wrote, *Boat Life in Egypt and Nubia* (1857); *Tent Life in the Holy Land* (1857); *Coins, Medals, and Seals, Ancient and Modern* (1861); *The Owl Creek Letters* (1848); *Pottery and Porcelain of All Times and Nations* (1877); and the hymn "O Mother, Dear Jerusalem" (1865). He also edited *McClellan's Own Story* (1886).

PRIME MERIDIAN CONFERENCE. The terrestrial longitude of any place (see LATITUDE AND LONGITUDE) is the angle between two great circles on the earth's surface, both passing through the terrestrial poles, and touching respectively the place in question and some other place selected as the origin of longitudes. The great circle passing through the place thus selected as origin is called the prime longitude meridian. As early as 1630 an international conference was called to meet in Paris to fix a common prime meridian. The meridian of the island of Ferro, one of the Canaries, was selected, but the position

of the island with reference to points on the continent was not known, and was never authoritatively determined, so that practically this effort failed. In 1882 the United States Congress passed a joint resolution authorizing the President "to call an international conference to fix and recommend for universal adoption a common prime meridian to be used in reckoning longitude, and in the regulation of time throughout the world." The conference assembled in Washington, October 1, 1884. Delegates representing twenty-six countries were present, but they were not able to agree unanimously upon a prime meridian. However, most of them favored the adoption of Greenwich, England, as the origin of longitudes. The French delegates represented the only important nation that would not agree; and at present French authorities and navigators still reckon from Paris. The other important maritime nations now count from Greenwich, and in this number the United States are included.

PRIMER. A device for igniting the propelling charge in firearms or artillery. Cannon were first ignited by red hot irons or port fires applied to loose powder on the vent (touch-hole). These were replaced by slow match and later the powder was put into tubes or quills for insertion into the vent. In 1782 flint locks were used upon naval cannon. Friction composition was invented in 1807, and a few years afterwards percussion caps were introduced for cannon. Later, and to a certain extent at present, friction primers were used. A copper tube extending into the vent holds an explosive charge which is ignited by pulling a roughened wire through the friction composition in a housing in the outer end of the tube. This has been largely displaced by fulminate caps set in the bases of metallic fixed-ammunition cases and exploded by percussion or electricity. In percussion primers, a firing-pin strikes the fulminate of mercury which rests on an anvil. In electric primers the current heats a fine platinum wire set in guncotton. See GUNS, NAVAL; CARTRIDGE; SMALL ARMS; and ORD-NANCE.

PRIMES (from Lat. *primus*, first). One of the two classes into which integers are divided according to divisibility. Integers that are not exactly divisible by any integer except themselves and one are called *primes*, all others being called *composite* numbers. Thus, 1, 2, 3, 5, 7, 11, 13, 17, 19, 23, 29, are primes. Two integers are said to be prime to each other, or relatively prime, when they have no common factor except unity. Thus, 11 and 21, 15 and 32, 15, 32, and 48 are relatively prime. One of the earliest and best known methods of selecting primes is the sieve of Eratosthenes (B.C. 200). This consists in writing down all the odd numbers from 3 on and then striking out all the multiples of 3, 5, 7, Tehebitcheff (q.v.) (1850) was the first to reach any valuable conclusions in the way of ascertaining the number of primes between two given limits. Riemann (1859) also gave a well-known formula for the limit of the number of primes not exceeding a given number. See NUMBER.

PRIMITIVE BAPTISTS. See BAPTISTS, heading *Old School, or Primitive*.

PRIMITIVE METHODIST CONNECTION. See METHODISM.

PRIMITIVE SOCIETY. See GENS; MARRIAGE; SOCIETY; SOCIOLOGY; TRIBE.

PRIMO (It., first). A term used in music with the following significations: *prima donna*, the leading female singer (soprano); *prima vista*, at first sight; *prima rotta* (abbreviated *l*) is always followed by a bracket extending over one or more measures before a *repeat* begins; *tempo primo* denotes a return to the original rate of speed; *primo uomo*, the leading male singer (first tenor or soprano). This term is now no longer used, but was in general use during the seventeenth and eighteenth centuries, when in Italy the principal rôles in operas were written for and sung by male sopranos.

PRIMOGENITURE (ML. *primogenitura*, from Lat. *primogenita*, rights of the first born, neu. pl. of *primogenitus*, first-born, from *primus*, first + *genitus*, p.p. of *gignere*, to produce). In the law of inheritance, the right of the first born to take by descent the real property of a deceased ancestor, to the exclusion of all others of equal degree of consanguinity. The term has sometimes been employed in a wider sense to describe any priority which, in various legal systems, the law has accorded to the first born, thus comprehending the birth-right of the Hebrew and of Hindu law (where that belonged, as was not always the case, to the eldest son), which was at the most a right to a double portion of the inheritance, as well as the right of the eldest of the heirs in certain forms of Anglo-Saxon tenure to the chief house (*mansio*) of the ancestor. But the term is in modern law usually restricted to the persistent rule of inheritance which has for centuries maintained itself in our common-law system, whereby the eldest son of his issue, or, failing lineal descendants, the eldest male in the next degree of consanguinity, takes all the real estate of which his ancestor died seised and intestate, to the exclusion of all female and of junior male descendants of equal degree. Although not confined to lineal descendants, but comprehending the remotest degrees of consanguinity, the principle of primogeniture has never in the common law of land been applied to female heirs, who have, whether lineally or collaterally descended from their common ancestor, always been permitted, in default of male heirs, to share the inheritance equally.

This rule of descent, due, in its origin, to the exigencies of the feudal system, was formerly common to feudal Europe, but it has long since disappeared everywhere but in England. It has not generally been adopted in the English-speaking colonies of Britain, and though introduced with the rest of the common-law system into the American colonies, it was abrogated and abandoned by them at an early period in their history. See DESCENT; INHERITANCE. Consult Maine, *Ancient Law*, and id., *Early History of Institutions*.

PRIMORSKAYA, prê-môr'ská-yá. The Russian name of the Maritime Province (q.v.) in Siberia.

PRIM'ROSE, CHARLES. The Vicar in Goldsmith's *Vicar of Wakefield*, a simple-minded, devout, charitable man, bearing misfortunes with resignation and nobility.

PRIMROSE FAMILY. A popular name for an order of plants. See PRIMULACEÆ.

PRIMROSE LEAGUE, THE. A political league founded in London in 1883 in support of the principles advocated by the Earl of Beaconsfield (see DISRAELI), the name being adopted, it is said, on account of a preference shown by him for that flower. The membership includes both sexes, and the titles applied to members are Knight and Dame. There are associate members also and the branches or divisions of the league are known as habitations. The titles of the officers are grand master, chancellor (who is chairman of the grand council), and vice-chancellor.

PRIMULA (ML., fem. of Lat. *primulus*, diminutive of *primus*, first; so called in allusion to the early bloom), PRIMROSE. A genus of plants of the natural order Primulacæ, comprising about 150 species, mostly perennials, generally having only radical leaves and bearing the flowers in an umbel, more rarely solitary, on a scape. This genus is indigenous to Asia and Europe and more than half the number of species are native to the Himalayas, China, and Japan. Two small unimportant species are found in North America. Their fine colors and soft, delicate beauty have led to the cultivation of some of the species, and numerous varieties and hybrid forms with single and double flowers of various tints have been developed. They are extensively grown in ornamental gardening and also as house and conservatory plants. The common primrose (*Primula vulgaris*) is abundant in woods, hedges, and meadows in most parts of Europe. It has spoon-shaped and deeply veined leaves and bears its yellowish-white blossoms on single-flowered

EUROPEAN WILD PRIMROSE (cultivated form).

scapes. It is the parent species of many cultivated varieties. The name primrose belongs especially to this species. The English cowslip (*Primula officinalis*) is allied to the common primrose, and the oxlip (*Primula elatior*) is an intermediate between the two species. The Chinese primrose (*Primula sinensis*) is a popular ornamental plant in residences and conservatories and is commonly sold in flower markets. It is highly prized for its numerous large flowers of a variety of colors borne in umbels above the foliage. *Primula oboconica* is another beautiful Chinese species largely grown in conservatories for its numerous pale lilac or purple and sometimes nearly white blossoms.

The garden primroses prefer a rich, moist, loamy soil, and shady positions. The greenhouse varieties are potted in light soil chiefly composed of leaf mold with some sand and loam. The varieties grown in the open are propagated by seed or by dividing the clumps. The seed is sown out of doors in summer, preferably in pans; the young plants are potted and kept in a cold frame or the greenhouse over winter. In the spring the plants are set out in the pots where desired. Sometimes strong seedlings are planted in the open directly from the seed pans. The tender varieties grown under glass are also increased by seeds and offsets started in the greenhouse. The name primrose has reference to the early flowering of the plants of this genus. See *AURICULA*; *POLYANTHUS*; and Colored Plate of *GREENHOUSE PLANTS*. In America certain species of *Oenothera* (q.v.) are called evening primrose.

PRIMULA'CEÆ (Neo-Lat. nom pl., from ML. *primula*, primrose), PRIMROSE FAMILY. An order of dicotyledonous herbs, containing more than 350 known species, some of great beauty, mostly natives of temperate and cold regions. The flowers, often terminal on scapes, are regular, usually five-parted, and followed by capsular fruits. Among the best known genera are *Primula*, *Androsace*, *Lysimachia*, *Glaux*, *Cyclamen*, and *Dodecatheon*.

PRIMUM MOBILE (Lat., the first part movable). In the Ptolemaic system of astronomy, the tenth or outermost of the crystalline spheres, supposed to revolve from east to west every twenty-four hours, carrying the other spheres with it.

PRINCE (OF., Fr. *prince*, from Lat. *princeps*, from *primus*, first + *capere*, to take). An epithet which was originally applied to the *princeps senatus* of the Roman State, and afterwards became a title of dignity. It was adopted by Augustus and his successors; hence the word was afterwards applied to persons enjoying kingly power. In various parts of Continental Europe the title Prince is borne by families of eminent rank, but not possessed of sovereignty; and in England a duke is, in strict heraldic language, entitled to be styled 'high puissant and most noble prince,' and a marquis or earl as 'most noble and puissant prince.' Practically, however, in England, the term prince is restricted to members of the royal family. In Germany and Austria the ambiguity of applying the same title to the members of the royal houses and princely families, not sovereign, is avoided, the former being styled 'Prinz,' the latter 'Fürst.' The German Fürst takes rank below the duke (Herzog). In France the title has frequently been borne by e.g. the son of a duke, thus denoting no special rank or precedence.

PRINCE, THOMAS (1687-1758). An American historian and antiquary, born in Sandwich, Mass., of an old colonial family. He graduated at Harvard in 1707, was ordained, traveled in the West Indies and England, returned to Boston (1717), and was made assistant at the Old South Church (1718), with which he was connected till his death, which occurred at Boston, October 22, 1758. In 1703 he began a collection of manuscripts and books on the history of New England, which were deposited in the Old South Church tower, and partly destroyed by the Brit-

ish (1775-76). What remained forms the Prince collection in the Boston Public Library. Of the books, a catalogue was prepared by that institution in 1868, reëdited in 1870. Prince's chief work is *The Chronological History of New England* (1736-55; new ed. 1826), which he was not sufficiently encouraged to prosecute. Thus it does not come beyond the year 1633; for a large portion was devoted, according to the custom of early writers, to an abridged annalistic history of the world before the landing of the Pilgrims. Prince was so accurate, however, that what he wrote was of great value. Noteworthy, too, are his *Account of the English Ministers at Martha's Vineyard* (1727) and his *Earthquakes of New England* (1755). He published sermons during his lifetime, and several were printed after his death. As a scholar he probably surpassed all colonial Americans save Cotton Mather.

PRINCE ALBERT LAND. A large island of unknown area, lying to the north of the Mackenzie District of Canada, and constituting a part of the newly established Canadian District of Franklin (Map: Canada, G 2). It is typically Arctic in its character and has been but little explored. Its southern portions are known as Victoria Land and Wollaston Land.

PRINCE EDWARD ISLAND. The smallest province of the Dominion of Canada. It is situated in the southern part of the Gulf of Saint Lawrence, being separated from New Brunswick and Nova Scotia by the Strait of Northumberland (Map: Canada, S 7). Length, 130 miles; breadth, 4 to 30 miles; area, 2133 square miles. The surface is undulating; none of the hills, the chief of which are in the middle of the island and run from north to south, exceed 500 feet in height. The coasts are generally low and sandy, but in some places there are bold cliffs, varying in height from 10 to 100 feet and composed of Triassic red sandstone, the principal underlying formation. The island is indented with numerous bays and inlets, several of which, as Cardigan Bay on the east, the approach to Georgetown, and Hillsborough Bay on the south, the approach to Charlottetown, are deep and spacious and afford safe anchorage for large vessels. The rivers are short tidal streams. The climate is very healthful, being milder than that of the continental regions in the vicinity and free from the fogs which prevail on Cape Breton and Nova Scotia.

Forests originally covered the entire island. About two-thirds of the area is now cleared. Aside from some of the boggy and swampy lands, the whole of the island is cultivable. The soil, which is well watered with numerous springs and rivers, rests upon red sandstone. It consists for the most part of a layer of vegetable matter above a light loam, which rests upon stiff clay above sandstone, and is of great fertility. The agricultural products are about double the quantity required for local consumption. The natural fertility of the soil was injured by too great a succession of cereal crops, but it has been renewed through the application of mussel mud (a natural fertilizer dredged from the bays and rivers). According to the census of 1901 there were 161,472 acres of oats, 42,318 of wheat, 181,996 of hay, and 33,405 of potatoes. Turnips produce phenomenally and are extensively raised. Bar-

ley and buckwheat are grown. Fruit does not flourish so well as in Nova Scotia. The island has long been noted for its large production of eggs. Dairy farming is growing in prominence. Stock, especially cattle, are increasing in numbers. Prince Edward Island is extremely poor in minerals. Coal exists, but not under conditions which have made mining profitable. The neighboring waters abound in fish of many varieties, and the location of the island is most favored for fishing, yet the people have not engaged as extensively in the industry as have the populations in the sister provinces. In 1899, however, the catch was estimated at over \$1,000,000, the lobster fisheries constituting nearly one-half of the amount. Manufactures are not important, and are principally for domestic wants. Butter and cheese factories number 30 and 40 respectively and are constantly increasing in importance.

The Prince Edward Island Railway, which runs the length of the island, was built by the Dominion Government, by whom it is still owned and operated. All parts of the island are traversed by coach-roads. Regular water communication is maintained with the maritime provinces and Boston, except during the cold months, at which time navigation is impossible for the ordinary steamer. The Government has constructed a special boat which keeps up communication with New Brunswick throughout the winter.

The colonial government is vested in a Lieutenant-Governor, an executive council appointed by the Lieutenant-Governor, and a legislative assembly consisting of a single house whose members are elected by the people. The Province receives an annual subsidy from the Dominion, which constitutes nearly two-thirds of the total Government revenue. In 1901 the amount was \$196,931. The island is divided into three counties—Prince, Queens, and Kings—of which the chief towns are respectively Summerside, Charlottetown, and Georgetown. But most of the local affairs are in the hands of the provincial assembly.

POPULATION. The population decreased between 1890 and 1900 from 109,000 to 103,259. The density per square mile (50) is the highest for any Canadian province. This is true also of the average size of family (5.6.) The inhabitants are of British origin. Charlottetown, the capital, had a population of 12,080 in 1900. The strongest religious denominations are, in their order: the Roman Catholic, Presbyterian, Methodist, Anglican, and Baptist. Anglican episcopal authority over the province is exercised by the Lord Bishop of Nova Scotia, and Roman Catholic by the Bishop of Charlottetown. The free school system was established in 1851, and the schools are supported by Government grants and district assessments. The system is administered by a superintendent and council appointed by the Government. There is an average annual enrollment of 13,000 pupils, the expenditure for 1900 being about \$7.50 per enrolled child, of which amount the Government grants were nearly three-fourths.

The island is supposed to have been seen by Cabot in 1497. It came with Canada into English hands in 1763. The Legislature of Prince Edward Island at first declined to agree to the plan for a union of the British

North American colonies which resulted from the negotiations begun in 1864; but at last, in 1873, the colony entered the confederation and became one of the provinces of the Dominion. Consult Campbell, *History of Prince Edward Island* (Charlottetown, 1875).

PRINCE OF WALES, CAPE. See CAPE PRINCE OF WALES.

PRINCE OF WALES ISLAND. An island belonging to the Straits Settlements. See PENANG.

PRINCE PRETTYMAN. A character in the Duke of Buckingham's farce *The Rehearsal*. He is in love with Floris, and appears sometimes as a fisherman and sometimes as a prince. He is a parody on Leonidas in Dryden's *Marriage à la Mode*.

PRINCE RUPERT'S DROPS. Drops of glass thrown, when melted, into water, and thus suddenly consolidated. They have usually a form somewhat resembling a tadpole. The thick end may be subjected to smart hammering on an anvil without its breaking; but if the smallest fragment of the tail be nipped off, the whole flies into fine dust with almost explosive violence. The phenomenon is due to the state of strain in the interior of the mass of glass, caused by the sudden consolidation of the crust.

PRINCE'S-FEATHER. An annual plant. See AMARANTH.

PRINCE'S ISLANDS. A group of nine small islands, anciently called *Demonesi*, in the Sea of Marmora, 13 miles southeast of Constantinople. There are several monasteries on the islands, a theological seminary of the Greek Church, and a naval college. A favorable climate and fine scenery have made the group a popular place of resort. An earthquake in 1894 caused great destruction of life and property. Prince's Islands are of considerable historic importance. The population is estimated at about 10,000, though but four of the islands are inhabited.

PRINCES OF THE TOWER. The name given to Edward V. (q.v.) of England and his brother, Richard, Duke of York, the sons of Edward IV. (q.v.). In May, 1483, they were seized by their uncle, Richard, Duke of Gloucester (see RICHARD III.), and imprisoned in the Tower of London, while Gloucester was recognized by the Royal Council as Protector. The fate of the princes is a mystery. At first it was rumored that they had been murdered, although later they were popularly supposed to have been exiled. After twenty years Sir James Tyrrell alleged that on the refusal of Brackenbury, Constable of the Tower, to murder the princes at Richard's instigation, he himself with two servants had smothered them in their sleep. The testimony of Tyrrell, a notorious blackguard, in the reign of Henry VII. (q.v.), the enemy and successor of Richard, is by no means above suspicion. In the reign of Charles II. two skeletons were found at the foot of a staircase of the White Tower, and were buried in Westminster Abbey as the remains of the two princes. Here again the evidence is weak. The popular prejudice against their uncle in the Tudor reigns, perpetuated in great part by the pathetic scenes in Shakespeare's *Richard the Third*, are doubtless responsible for the attribution to Richard of a crime which has never been proved.

PRINCE'S PINE. An American evergreen plant. See WINTERGREEN.

PRINCESS, THE. A poem by Tennyson (1847). Mediæval in setting, but modern in thought, it is a kind of epic on the question of woman. The Princess Ida, to carry out her views, founds a college from which all men are debarred. The prince to whom she is betrothed enters with companions disguised as girls, and finally wins her love. The songs interspersed are some of the noblest lyrics of the last century.

PRINCESSE DE CLEVES, prân'sês' de klāv, LA. A novel by Madame de la Fayette (1677). The scene is the time of Henry II., but the plot is imaginary. The heroine loves the Duke de Nemours, but duty conquers, and her husband, though aware of her distress, never knows the name of his rival, a painful situation delicately treated. These characters stand for the author, her husband, and La Rochefoucauld.

PRINCES STREET. A famous street in Edinburgh, Scotland, overlooking the gardens beyond which stands the Castle. On one side it is lined with public buildings and monuments, and on the other is a beautiful terrace.

PRINCETON, prins'ton. A city and the county-seat of Bureau County, Ill., 103 miles west by south of Chicago; on the Chicago, Burlington and Quincy Railroad (Map: Illinois, C 2). It has the Matson Public Library and the library of the township high school, which was one of the first institutions of its kind established in the State. The surrounding district is fertile, and is engaged in farming and cattle-raising and coal-mining. The water-works and electric light plant are owned and operated by the municipality. Princeton was settled in 1830, incorporated in 1838, and chartered as a city in 1884. Population, in 1890, 3396; in 1900, 4023.

PRINCETON. A city and the county-seat of Gibson County, Ind., 27 miles north of Evansville; on the Evansville and Terre Haute and the Southern railroads (Map: Indiana, B 4). It has a fine court-house and a public library. The principal industries are farming and coal-mining, and the manufacturing of flour, carriages, wood handles, lumber, and brick. Shops of the Southern Railroad also are here. Princeton was settled in 1814. Population, in 1890, 3076; in 1900, 6041.

PRINCETON. A borough in Mercer County, N. J., 10 miles north by east of Trenton; on a branch of the Pennsylvania Railroad (Map: New Jersey, C 3). Princeton is a very picturesque town. It has an elevated site of great natural beauty, enhanced by wide avenues and fine shade trees. Its handsome residences, too, many of which are in the colonial style, add to its attractiveness. Princeton University (q.v.) is the chief feature of the borough. Other educational institutions in Princeton are the Princeton Theological Seminary (q.v.) and the Princeton Preparatory School. Population, in 1890, 3422; in 1900, 3899.

Princeton was first settled about 1696 and received its present name in 1724. It was of little importance, however, until the removal here from Newark of the College of New Jersey in 1756. On August 27, 1776, the first State Legislature of New Jersey assembled here and on the 31st chose William Livingston as Governor.

Washington here surprised and defeated a body of British on January 3, 1777. (See PRINCETON, BATTLE OF.) Congress, driven from Philadelphia by mutinous soldiers, met in Nassau Hall, Princeton, in June, 1783, and was in session until November 4th. It was here that news reached it on October 31st of the final signing of the definite treaty of peace with England. Consult: Hageman, *History of Princeton and Its Institutions* (Philadelphia, 1870), and a sketch in Powell, *Historic Towns of the Middle States* (New York, 1899).

PRINCETON, BATTLE OF. A battle of the American Revolution, fought January 3, 1777, at Princeton, N. J., between an American force under General Washington and an inferior British force under Colonel Mawhood and General Leslie. On January 2d Cornwallis with about 8000 men took up a position on the west bank of the Assunpink, at Trenton opposite the American army, which was inferior in every way to his own. Washington, unable on account of the floating ice to retreat across the Delaware, immediately resolved to attack the British detachments at Princeton and New Brunswick, and, leaving his camp fires burning, marched around the British left during the night. Reaching the Stony Brook Bridge, about three miles from Princeton, at sunrise, he sent General Mercer with about 400 men to destroy the bridge on the main road to Princeton, and went himself by a shorter way. The British force at Princeton, on its way to Trenton, encountered Mercer's brigade at the bridge. The Americans, occupying a piece of rising ground, began a vigorous fire upon the British, who soon made a bayonet charge and drove them from their position. During the fight General Mercer was mortally wounded, and his troops slowly retreated. The British pursued, but were soon stopped by a force of regulars and militia under Washington, who displayed the greatest personal gallantry. After a short but fierce engagement, the British retreated rapidly, some toward Trenton and some toward New Brunswick, while Washington entered Princeton and seized the military stores left there by the enemy. On the approach of Cornwallis, he withdrew, and took up a strong position at Morristown. The British loss was more than 100 killed and wounded, and about 230 prisoners. The American loss was about 100. Strategically the battle was very important, as it forced Cornwallis to fall back to New York, and left New Jersey in the possession of the Americans, besides inspiring the hitherto discouraged people to renewed efforts against the enemy. Consult: Stryker, *Battles of Trenton and Princeton* (Boston, 1898); and Johnston, *Campaign of 1776 Around New York and Brooklyn* (Brooklyn, 1878).

PRINCETON THEOLOGICAL SEMINARY. One of the oldest Protestant schools of theology in America. In 1809 the proposal to found a theological seminary for the Presbyterian Church was introduced before the General Assembly in the form of an overture from the Presbytery of Philadelphia. In 1812 the General Assembly fixed the location of the seminary temporarily at Princeton. The first session began on August 12, 1812, with three students in attendance, and in 1822 an act was passed incorporating the institution under the name of the Trustees of the Theological Seminary of the Presbyterian Church.

During its existence over 5000 students have been matriculated, coming from nearly every State of the Union and from foreign countries. The curriculum as at present organized embraces eight departments of study. The teaching force consists of ten professors and seven instructors. The biblical criticism of Princeton is conservative. The theology taught is the type of Calvinism set forth in the Westminster Confession of Faith and Catechisms, interpreted in the light of the classical literature of the English Puritan, Swiss, and Dutch theologians who wrote after the Synod of Dort. The representative publications of the seminary are the essays in the old *Princeton Review*, written by its professors, and in the *Presbyterian and Reformed Review* and the current *Princeton Theological Review*; together with the writings of Archibald and Joseph Addison Alexander, especially the commentaries of the latter on the Psalms and the Prophecies of Isaiah; the works of Samuel Miller, chiefly in ecclesiastical history; the three volumes of *Systematic Theology* by Charles Hodge; and the critical works of William Henry Green on the various Pentateuchal questions. The seminary had in 1903 a library of 70,600 volumes, and 30,000 pamphlets, grounds and buildings valued at \$526,150, an endowment of \$1,423,333, and a gross income of \$70,557. Its total attendance was 172 including 15 graduates and 8 special students.

PRINCETON UNIVERSITY. An institution of higher education at Princeton, N. J., founded in 1746. About 1726 William Tennent, a graduate of the University of Edinburgh, had established in Bucks County, Pa., a school known as the Log College, the success of which led in 1739 to a movement by the Synod of Philadelphia toward the establishment of a larger college for the middle colonies. The plan was abandoned owing to the unsettled condition of the times. In 1742 internal conflicts led to the division of the synod, and members of the newly formed Synod of New York determined on independent action. They sought a charter for the founding of a college in New Jersey, without assistance from either of the old synods, and secured it on October 22, 1746, from John Hamilton, Acting Governor of New Jersey. The institution was called the College of New Jersey and was situated at Elizabethtown. The first president was Rev. Jonathan Dickinson. A second charter was granted in 1748 by Jonathan Belcher, royal Governor of New Jersey, owing to doubts as to the validity of the first charter, and in order to give other religious communions a share in the administration of the institution. President Dickinson died in 1747 and was succeeded by the Rev. Aaron Burr, to whom belongs the credit for the organization of the curriculum, the procedure, and the discipline of the college. The institution was soon removed to Newark, where the first commencement was celebrated in 1748. In 1752 it was voted that the college be fixed at Princeton upon condition that the inhabitants secure to the trustees 10 acres of cleared land, 200 acres of woodland, and the sum of £1000. In 1754 the cornerstone was laid for the first building, which was named Nassau Hall. The college was completed and the students removed from Newark to Princeton in the fall of 1756. President Burr died in 1757 and was succeeded by Rev. Jonathan

Edwards, who died a month after assuming office. He was followed by Rev. Samuel Davies, who devoted much time to building up a college library. Davies was succeeded by Rev. Samuel Finley (1761-66) and in 1768 John Witherspoon, D.D., a Scotch clergyman, was inaugurated as president. He was a bold and active advocate of American independence. Among the students of this period were many later conspicuous as leading spirits, among them James Madison, Aaron Burr, William Bradford, Philip Freneau, and Henry Lee. The college suffered heavily during the war. The course of instruction was interrupted by the presence of both armies; Nassau Hall was wrecked, the library scattered, and the philosophical apparatus ruined. Yet only one commencement, that of 1777, was omitted, and the seven members of the graduating class for that year received their degrees a few months after the regular time.

President Witherspoon was succeeded in 1795 by Samuel Stanhope Smith, under whose administration the curriculum was broadened and the first provision for regular instruction in chemistry in an American college was made. On March 6, 1802, the interior of Nassau Hall was destroyed by fire, but was rebuilt in 1804. During the administrations of Presidents Ashbel Green (1812-22) and James Carnahan (1823-54) the institution had a rapid development. A department of law was established in 1846, but was abandoned in 1852 from lack of funds. Under President John Maclean (1854-68) four new professorships were established, with an endowment of \$195,000. On March 10, 1855, the interior of Nassau Hall was again burned, and was rebuilt in 1860. James McCosh of Queen's College, Belfast, was elected president in 1868, and resigned the office in 1888. During his term the attendance increased from 281 to 603, and the faculty from 10 professors and 7 tutors to 31 professors, 4 assistant professors, and 5 instructors. Gifts amounting to upward of \$3,000,000 were received, of which \$1,000,000 was expended in the erection of 14 buildings. Among the more important changes in the curriculum were the introduction of the system of elective studies (1870); the founding of the John C. Green School of Science (1873); and the establishment of the Graduate Department (1877). Francis Landey Patton (q.v.) became president in 1888. During the fourteen years of his administration the college increased from 603 to 1354 students, and the faculty from 40 to 100 instructors, while 17 new buildings were added to the equipment. On October 22, 1896, the one hundred and fiftieth anniversary of the signing of the first charter of the College of New Jersey, the corporate title was changed to Princeton University. Dr. Patton resigned the presidency in June, 1902, to resume the work of teaching in the Princeton Theological Seminary, and, at his own request, was succeeded by Woodrow Wilson (q.v.), the first lay president of the institution.

The government of the university is in the hands of a self-perpetuating board of trustees under the presidency of the Governor of New Jersey. In 1900 five alumni trustees were added to the board, holding office for five years. The requirements for admission to the college, since June, 1903, conform to the recommendations of the National Educational Association and the

College Entrance Examination Board, whose certificate is accepted in place of the regular examination. The university is organized in three departments, the Academic, the School of Science, and the Graduate School. The college course embraces instruction in the three departments of philosophy, language and literature, mathematics, and natural science. Most of the studies of the freshman year are required, with election between French and German. The elective studies of the sophomore year are Latin, Greek, mathematics, French, and German, while the elective course of the junior year occupies two-thirds of the student's time, and the senior year offers seven elective courses. Optional courses are also offered for those who wish to extend their work in special studies. In the John C. Green School of Science four-year undergraduate courses in general science lead to the degree of B.S., and the courses in chemistry and electricity to the degrees of C.E. and E.E. The graduate department offers over 200 courses of study leading to the master's and doctor's degree in arts and science. A number of fellowships, ranging in value from \$200 to \$600, are offered for advanced work.

The university campus now consists of 225 acres. Nassau Hall (1756) contains the histological and paleontological laboratories, the laboratory of experimental psychology, the department library of geology and paleontology, and the museum. The dormitories include West College (1836); Reunion Hall (1870), named to commemorate the reunion of the Old and New Schools of the Presbyterian Church; Witherspoon Hall (1877); Edwards Hall (1880); Albert B. Dod Hall (1890); David Brown Hall (1891); Blair Hall (1897), a sesquicentennial gift from the Hon. John Insley Blair; Stafford Little Hall (1899), which is joined by an extension erected in 1902; and University Hall (1876). Upper and Lower Pyne buildings were erected in 1896. The sod was turned by President Wilson for a new dormitory, presented by the class of 1879, on the day of his inauguration, October 25, 1902. There are two library buildings, the Chancellor Green Library (1873), refitted as the working library of the university, and the New Library Building, dating from the sesquicentennial. It is connected with the Chancellor Green Library. The general collection occupying the united buildings in 1903 numbered 175,000 volumes and 47,000 unbound periodicals and manuscripts. Departmental libraries and special collections raise the number of volumes at the disposal of the students to a total of over 265,000. The museums comprise those in geology and archaeology, biology, historic art, and mathematical models. The laboratories include the magnetic observatory, in connection with the School of Electrical Engineering; the chemical, histological, biological, paleontological, and civil engineering laboratories, with the mineralogical collections of the School of Science. Other important university buildings are the Halsted Observatory, containing the Clark equatorial, of 23 inches aperture, for scientific work, chiefly in the department of astronomical physics; the observatory of instruction, with a Clark equatorial of 9½ inches aperture, devoted entirely to the use of students; the Isabella McCosh Infirmary, erected by alumni and friends of the university; Dickinson Hall (1870), for the work of the academic

department; Marquand Chapel (1881); Alexander Hall, seating 1500 persons, and used for commencement exercises and other public occasions; and the gymnasium (1869). A new gymnasium was erected in 1902-03 by the alumni at a cost of more than \$280,000.

The university provides pecuniary aid to deserving students through a large number of endowed scholarships and charitable funds. In 1903 the total student attendance was 1383, and the faculty numbered 108. The endowment is about \$2,500,000, and the annual income about \$275,000.

PRINCIPAL (Lat. *principalis*, chief, from *princeps*, first, chief, prince). A legal term having several different applications. Thus, in criminal law, all actually participating in the commission of a crime or who are present aiding and abetting in its commission are principals, while those who aid or abet before or after its commission are termed accessories. Actual physical presence is not necessary to constitute one a principal. One may be a principal who is only constructively present at the commission of the crime by aiding in its commission at the time. See **ACCESSORY**.

In the law of agency, one who appoints an agent is called a principal. (See **AGENT**; **MASTER AND SERVANT**.) In the law of suretyship, the principal debtor for whom another becomes surety is known as a principal. See **SURETY**; **FRAUDS, STATUTE OF**.

PRINCIPAL. The name given to an important stop of the organ, of 4-foot pitch on the manual, and 8-foot pitch on the pedal. It is sometimes termed the octave stop, because it is tuned one octave above the diapasons. It stands midway in pitch between the diapasons and the fifteenth; and in tuning an organ it is, owing to its clearness of tone, the best stop to begin with for the adjustment of other stops; probably from this fact it derives its name. See **ORGAN**.

PRINCIPAL AND AGENT. The legal rules governing this relationship are set forth under the heading **AGENT**, and the subject in its general aspects is there discussed. For the special doctrines applicable to the most important examples of this relationship, see **ATTORNEY**; **AUCTIONEER**; **BROKER**; **COMMISSION MERCHANT**; **DEL CREDERE**; **COMMISSION**; **SHIPMASTER**.

PRINCIPAL AND SURETY. A phrase descriptive of two persons who are indebted to a third, but whose relations are such as to make it the duty of the principal to discharge the debt and save the surety harmless therefrom. See **GUARANTY**; **SURETYSHIP**; and the authorities there cited.

PRINCIPE, prín'thâ-pâ. A district on the east coast of Luzon, Philippine Islands, belonging to the Province of Tayabas (q.v.).

PRINCIPE (prín'châ-pe), IL (It., the Prince). A celebrated short political treatise by Niccolò Machiavelli (1513) showing how a ruler might gain and extend absolute power. Cesare Borgia was presumably the model for the prince, and the dissimulation and treachery advocated to attain success made Machiavelli's principles synonymous with political infamy. A modern view has credited him with ardent longing for Italian unity and with the purpose of portraying merely the methods of his day.

PRINCIPIA (Lat., principles). A famous mathematical treatise in Latin, by Sir Isaac Newton (1687). It consists of three parts, two on the motions of bodies and one on the solar system, and contains the full development of Newton's great discovery, the principle of universal gravitation.

PRINCIPES. See AGAPEMONE.

PRINDLE, CYRUS (1800-77). An American abolitionist and one of the founders of the Wesleyan Church of America. He was born in Vermont, and entered the New York Conference in 1821; an abolitionist in principle, he was removed from important appointments to the poorest; in 1843 with others he seceded from the Methodist Episcopal Church and founded the Wesleyan Church; when the work of the Church was done, with about 100 others of his ministerial associates, he came back to the Methodist Episcopal Church.

PRINGLE, priŋ'g'l. Sir JOHN (1707-82). An English physician, born at Stichel, Roxburghshire, and educated at Saint Andrews, at Edinburgh, at Leyden, and in Paris. In 1734 he was appointed professor of metaphysics and moral philosophy in Edinburgh University. He settled in London in 1748, where he became physician to the Queen in 1761 and to the King in 1774. His most important work was done as an army sanitarian, in which field his *Observations on the Diseases of the Army* (1752) is regarded as a classic. His life by Kippis is prefixed to *Six Discourses Delivered at the Royal Society* (London, 1783).

PRINGLE, THOMAS (1789-1834). A Scottish poet, born at Blaiklaw, Teviotdale, Roxburghshire. He was educated at the University of Edinburgh. In 1811 he became clerk in the register office, Edinburgh, and with his friend, Robert Story, began writing clever satirical verse. A poem contributed to Hogg's *Poetic Mirror* (1816) resulted in a friendship with Scott. Helped by James Cleghorn, he edited Blackwood's *Edinburgh Monthly Magazine* (six numbers, April to September, 1817). Having quarrelled with the publisher, he resigned, and *Blackwood's Magazine* (established October, 1817) took the place of the older periodical. In 1820, to better his fortune, Pringle sailed for South Africa, where he formed the settlement of Glen-Lynden, became librarian at Cape Town, founded an academy, and started a Whig newspaper and a magazine, both of which were suppressed by the Government. Returning to England (1826), he became secretary to the Anti-Slavery Society (1827). In his new position he displayed great energy. He died just as he was about to sail for South Africa, on December 5, 1834. Pringle's works comprise a collection of his early poems entitled *Ephemerides* (1828); *African Sketches* (1834), composed of poems inspired by South Africa and the "Narrative of a Residence in South Africa." The latter volume contains "The Emigrants" and "A Farm in the Desert." Pringle's finest poems. Editions by Conder (1835) and Ritchie (1838) contain biographical sketches.

PRINGLE-PATTISON, ANDREW SETH (1856—). A British philosopher. He was born at Edinburgh; was educated there and in Germany; became professor of logic, rhetoric, and metaphysics at Saint Andrews (1887), and professor of logic

and metaphysics at Edinburgh in 1891. In 1898 he assumed the name Pringle-Pattison on succeeding to the Haining estate. He has published: *The Development from Kant to Hegel* (1882); *Essays in Philosophical Criticism*, with R. B. Haldane (1883); *Scottish Philosophy* (1885); *Hegelianism and Personality* (1887); *Man's Place in the Cosmos* (1897); *Two Lectures on Theism* (1897).

PRINGSHEIM, prings'him, NATHANAEAL (1823-94). A German botanist, born at Wziesko, near Landsberg, Silesia. For a time he studied medicine, associated himself with the Liberal political movement, and then turned definitely to natural science, in which cryptogamic botany soon became his speciality. After studying at the universities of Breslau, Leipzig, Berlin, and Paris, he submitted, at Berlin, an essay *Zur Entwicklungsgeschichte der Achlya proliferata* and became a lecturer there. As a result of his essays *Grundlinien einer Theorie der Pflanzenzelle* (1854) and *Ueber die Befruchtung und Keimung der Algen und das Wesen des Zeugungsaktes* (1855-57), he was chosen in 1858 a member of the Royal Academy of Scientists. In 1857 he founded the *Jahrbuch für wissenschaftliche Botanik*, which he edited up to the time of his death. He was professor of botany at Jena from 1864 to 1868 and then returned to his lectureship at Berlin, but he had little interest in teaching and devoted himself almost entirely to research. In 1882 he founded and became the first president of the German Botanical Society. Pringsheim, Thuret, and Bornet are regarded as the founders of the scientific study of the algae, and the German was one of the first investigators to prove the existence of a sexual process in this kind of vegetation. During the last twenty years of his life his attention was directed more to plant physiology than to the morphological questions in which he won his greatest successes. He made extensive researches in the effect of light on plants, and developed a new, though not wholly satisfactory, theory of the function of chlorophyll. He was one of the foremost cryptogamic botanists of the nineteenth century. Among his works, which were published in four volumes at Jena in 1895-96, are the following: *Beiträge zur Morphologie der Meeresalgen* (1862); *Ueber die Embryobildung der Gefässkryptogamen und das Wachstum von Salvinia natans* (1863); *Ueber Paarung von Schwärmsporen* (1869); *Weitere Nachrichten zur Morphologie und Systematik der Saprolegniaceen* (1873); *Untersuchungen über das Chlorophyll* (1874).

PRINSEP, JAMES (1799-1840). An English architect and Orientalist, who studied under Pugin, the celebrated architect. Owing to impaired eyesight, he gave up for a time his studies, and went out to India (1819), where he became in turn assistant assay-master in the Calcutta mint, assay-master in the Benares mint, and eventually assay-master in the Calcutta mint (1832). At Benares he designed the mint, built a bridge over the Karamasa and took down and restored the minarets of the Mosque of Aunrungebe. At Calcutta he constructed a canal between the Hugli and the Sunderbands. In numismatics he won distinction by *Useful Tables Illustrative of Indian History*. At Calcutta he edited *Gleanings in Science*, afterwards the journal of the Asiatic

Society, of which he became secretary. Giving his attention to antiquities, he succeeded in deciphering inscriptions which had hitherto baffled scholars. Weakened in health, he returned to England in 1838, and died two years later. Consult the *Essays on Indian Antiquities, Historic, Numismatic, and Palæographic, of the Late James Prinsep* . . . with *Memoir by Henry Thoby Prinsep*, edited by Thomas (London, 1858).

PRINSEP, VALENTINÉ CAMERON (1838—). An English painter and author, born in Calcutta, India. He was a pupil in London of Leighton, whose style he imitated, and of Gleyre in Paris, and began to exhibit at the Royal Academy in 1862. His paintings "A Minuet," "A Bientôt," and "The Linen Gatherers," were at the Exposition of 1878. He went to India to paint the "Declaration of Queen Victoria as Empress" in 1876, a large canvas with many portraits. He was elected to the Royal Academy in 1897. His publications include *Imperial India: An Artist's Journal* (1879), several plays, and some writings on art.

PRINSTERER, GUILLAUME GROEN VAN. See GROEN VAN PRINSTERER.

PRINT (by apheresis, from ME. *emprinten*, *enprinten*, to imprint, from OF., Fr. *empreinte*, imprint, p.p. of *empreindre*, It. *imprimere*, to impress, imprint, from Lat. *imprimere*, *inprimere*. to impress, from *in*, in + *primere*, to press). In the arts, anything which is the result of, or which takes its principal characteristic from, having been printed upon or impressed. The most important use of the term, especially in connection with fine arts, is as being the only proper term for that picture which is produced by taking an impression, as upon paper, from an engraved plate or block. It is much the custom in the United States to speak of such pictures as 'engravings,' but this is, of course, erroneous and misleading, and the term 'print' is the one which should be used in such cases. The art of printing from an engraved plate is not wholly mechanical, because there are many cases in which the impression taken is not merely a flat transfer from the unmodified, hard surface. Thus, in printing woodcuts, it is customary to use what are called overlays, which are pieces of thin paper cut in peculiar shapes, accommodated to the design engraved upon the block; and these overlays are placed where needed behind the paper upon which the transfer is to be made in such a fashion as to cause certain parts of the printing to be stronger and blacker than others. So in the printing from dry point (q.v.) plates in which that process has been used for the completion of an etching (q.v.) it is quite usual to leave a certain amount of ink upon the surface of the copper plate. As in the *Liber Studiorum* (q.v.) the plates are etched and also charged with mezzotint or aquatint, so, in prints made by this process, the line work of the draughtsman is completed in a way by the surface work or gradation made by the printer. In ordinary commercial use, the word 'print' is used in a special sense, as meaning one of the more ordinary impressions from the block or plate in contradistinction to the proofs of different kinds. See PROOF.

PRINTING. The process of taking impressions, generally on paper in ink, of printing types or of designs, drawings, or photographic prints,

which have been previously cut, etched, drawn, or engraved on some solid surface. Printing with ink is done by three methods: (1) from a raised surface in high relief, as in type or woodcuts; (2) from a sunk or incised surface, as in copper-plate engraving; (3) from a flat surface on stone made repellent to ink in portions by daupening the stone, as in lithography (q.v.). As the raised surface is easiest inked and impressed, typography is found most generally useful.

The Chinese methods of printing were practiced at a very ancient date. As early as B.C. 50 the Chinese had originated a method of printing in ink on paper by means of engraved blocks, although it was not until nearly a thousand years later that printing in this manner was extensively practiced. In A.D. 925 the principal Chinese classics were printed for the Imperial College of Peking from blocks of wood engraved in relief. The method of producing these printing-blocks is described as follows: The work which is intended to be printed is first written on sheets of thin transparent paper. Each of these sheets is then pasted face downward upon a block of wood and an engraver with suitable tools cuts away the portions of the paper and block on which nothing is traced, thus leaving the characters in relief and producing a printing-block. To print from these blocks, they are inked; a sheet of paper is carefully laid on and a brush is passed over the paper, pressing it upon the inked surface and thus securing a printed impression. By this process a separate engraved block had to be prepared for each printed sheet or page. The Chinese are also credited with having used movable type as early as the twelfth and thirteenth centuries, and such types are now used extensively by the European missions in China for printing Chinese books and papers. The chief difficulty in using movable types for printing Chinese is due to the fact that each Chinese word requires a separate character instead, as in the European languages, of being composed of letters or characters which are resolvable into an alphabet. The native Chinese printer to-day, when uninfluenced by European teaching, uses the primitive printing-blocks described above.

In Europe in classical and mediæval times books were made by transcribing them in manuscript (q.v.). About the thirteenth century, in Italy and Spain, these manuscripts began to be produced with the initial letters stamped in ink from engraved blocks of wood. This practice was gradually developed until printing-blocks were quite commonly employed in printing images and text, generally of a religious character, on paper sheets which were bound together in book form. In short, the gradual development of printing in relief was as follows: (1) initial letters, autographs, and trade marks; (2) playing cards; (3) figured or ornamental textile fabrics; (4) religious pictures with and without lettering; (5) engraved words without pictures; (6) types of single letters founded in a mold.

Whether he was or was not the first to employ movable printing types, John Gutenberg (q.v.) is usually named as the inventor who first established typography on anything like a scientific basis. The claimant who seems to have the best right to contest with Gutenberg the invention of typography is Laurens Janszoon Coster (q.v.) of

Haarlem, Holland, who is said to have invented types of wood about 1428, and at a later date types of metal, with which he printed several small books. Coster's types are stated to have been stolen by one of his workmen and conveyed to Mainz, Germany, where this workman introduced typography. Among those for whom the honor of the invention is claimed are: Albrecht Pfister, of Bamberg, Germany; Pamphilo Castaldi, of Feltré, Italy; Johannes Mentel, of Strassburg, Germany; and Procopius Waldvogel, of Prague, whose claims are based on unreliable authority. None of the alleged inventors established the art or left worthy successors. It is to Gutenberg that we owe the practical establishment of typography. The facts in Gutenberg's career as a printer are meagre. There is an unsatisfactory record that he experimented with printing at Strassburg in 1439. In 1448 he had a printing office at Mainz; in 1455 he was sued by John Fust (q.v.), who was associated with him in the enterprise, for the recovery of money lent, and judgment being secured against him, Fust seized his printing house equipment. Another printing establishment was started by Gutenberg, who operated it until his death, about 1468, with his son-in-law, Peter Schöffer. Meanwhile Fust had continued the operation of the printing establishment founded by Gutenberg. Upon the sacking of Mainz by the Archbishop Adolf in 1462 the pupils and workmen of these printers were scattered and the art, which had been carefully guarded as a secret, became widely known. Printing was practiced in Rome in 1467; in Paris in 1469; in Spain in 1474; and in England in 1477, the first press in this last country being set up at Westminster Abbey by William Caxton (q.v.). The first press in the New World was established at the City of Mexico in 1540 and this was followed by one in Peru at Lima in 1584. The first press in the British colonies of North America was set up at Harvard College in 1638, and this press still continues under the name *University Press*.

In a brief review of the development of printing it is impossible more than to allude to the work of such famous printers as Aldus Manutius (q.v.), who, with other members of the same family, published the famous Aldine Editions (q.v.), the Elzevirs (q.v.), whose activities extended from 1583 to 1712, and the Stephens (q.v.) of Paris, famous for their editions of the Scriptures and the classics.

MODERN PRINTING TYPES. Types of metal are manufactured by a process of founding. (See **TYPE-FOUNDING**.) The earliest types used were of the style known as Gothic or black-letter, which was afterwards superseded, except in Germany, Russia and Greece, by the Roman letter. (See **BLACK-LETTER**.) Printers have a distinct name for each size of type, and use about 16 sizes in different descriptions of book-work; by the older terminology the smallest is called *brilliant*, the next *diamond*, and then follow in gradation upward, *pearl*, *agate*, *nonpareil*, *minion*, *brevier*, *bourgeois*, *long primer*, *small pica*, *pica*, *English*, *great primer*, and *double pica*. The larger sizes generally take their names thus—*two-line pica*, *two-line English*, *four*, *six*, *eight*, or *ten-line pica*, etc. Other nations designate many of these sizes by different names. Some of these names were given

from the first maker; others from the books first printed with the particular letter. Thus, *Cicero* is the name of a type in France and Germany, with which Cicero's letters were first printed (Rome, 1467); *pica* is from the service of the mass, termed *pica* or *pic*; *primer*, from *Primarius*, the book of prayers to the Virgin; *brevier*, from *breviary*; *canon*, from the *canons* of the Church, etc. The following illustrates the size of the various types named:

1—Brilliant,	International.
2—Diamond,	International.
3—Pearl,	International.
4—Agate or Ruby,	International.
5—Nonpareil,	International.
6—Minion,	International.
7—Brevier,	International.
8—Bourgeois,	International.
9—Long Primer,	International.
10—Small Pica,	International.
11—Pica,	International.
12—English,	International.
13—Great Primer,	International.

At present in Europe and America, generally, printers use a numerical nomenclature instead of the old nomenclature given above and commonly used by the layman. This nomenclature, as adopted by the United States Typefounders' Association in 1886, is as follows:

OLD NAME	Square of "body" in inches	New name
Excelsior.....	0.0415	<i>point</i> 3

A complete assortment of types is called a *font*, which may be regulated to any extent. American founders assort characters by weight and not by count. As types of the same body vary in width (some thin and some wide), a specification by count of single types would be misleading as to weight. The following table shows the relative frequency of the letters in composition:

The types used in printing offices are sorted in different boxes of two shallow trays known as *upper* and *lower case*, the latter lying nearest the compositor upon the frame for their support. The lower case is placed

immediately under his hand, the upper case directly above in a slanting position, and the under part of the frame is stocked with cases of different fonts. In the upper case are placed all the capitals, small capitals, and a few of the characters used as references to notes. In the lower case are all the small letters, figures, most of the points, and the spaces for blanks between the words. In the lower, alphabetical arrangement is not preserved; each letter has a larger or a smaller box allotted to it, according as it is more or less frequently required; the letters in most request are placed at the nearest convenient distance to the compositor. See article CASE for illustration.

TYPE-SETTING OR COMPOSING. The setting of printing types in proper order for printing is termed composing, and may be performed either by hand or by machine. (For machine composition, see TYPE-SETTING MACHINES.) In hand composition, the compositor places the copy before him on the upper case, and standing in front holds in his left hand a short tray of iron, known as a composing-stick. The stick has a movable slide, which may be regulated to any width of line. One by one the compositor picks up and puts together the letters of each word and sentence, and the appropriate points, into his stick, securing each with the thumb of his left hand, and placing them side by side from left to right along the line. When he arrives at the end of his line, the compositor must separate the words, so that they will fill the width of the measure. Spaces of varying thickness are inserted as evenly as possible between the words. When the compositor has set up as many lines as his composing-stick will hold conveniently, they are lifted by grasping them with the fingers of each hand, as if they were a solid piece of metal. He then places the mass upon a shallow tray termed a galley, which has a ledge on two or three sides.

The printer's unit of measurement by which the compositor is paid is the *em* in America and the *en* in Great Britain. An *em* is the square of the body of the type selected; the number of *ems* that fill a line, multiplied by the number of lines in a page gives the total number of *ems* of type in the page. The piece compositor is paid an agreed rate per 1000 *ems*, but the rate varies with different kinds of composition. Tabular matter, mathematical formulas, etc., are usually paid for on a time basis.

Composed type that has served the purpose for which it was set is known as *dead* matter, and its separate letters have to be distributed into the case for re-use, in new work. The compositor first wets the composition so that the separate types will slightly cling together. He then places a number of lines upon his composing rule, picks up a few types between thumb and forefinger, and drops them one at a time, into their proper compartments in the case.

MAKE-UP is done by taking composed type from the galley in sufficient quantity to make a page of prescribed size. It is then tied up so that it can be safely handled and is put upon an imposing-stone or iron-topped table. When the page consists of several columns, as in newspapers, the type of one column is placed after another, upon the stone. The pages are separated by suitable blanks, and the whole mass of type is 'locked up' by filling the angular space around the type and inside the iron frame with strips

of wood or metal and by wedging them with screw clamps or quoins, so tightly that none of the type can fall out. Proofs are taken from the type in galley and in page form, which are read for errors, so that corrections may be made before the type is sent to press. At least two proofs of the type—a galley proof and a page proof—are always taken and read for errors, and very often in careful work several proofs of each kind are 'pulled' and read by different persons. See **PROOF-READING**.

The printer's *form* may consist of any number of pages from 2 to 128. 'Imposition' is a method of arranging pages so that they will follow one another upon the printed paper in the proper consecutive order. The method of imposition or the order of arrangement differs according to the number of pages in the form, but the general principle of the process may be understood from the following diagram of a 16-page form, in which the numeral in each case indicates the number of the page in that form and its location

the top of the page. To guide the binder in arranging the printed sheets in their proper order, letters or numerals known as signatures are placed at the foot of the first page of each section. The letters J, V, and W are not used for this purpose.

STEREOTYPING is a process by which the composed types of a page are founded in one piece. The object is to preserve composition so that it cannot be distributed, to cheapen cost, and save wear of type. Many methods have been invented, but two only are now in use: stereotyping by the papier-maché process, and electrotyping. The papier-maché process is preferred for its speed by daily newspapers; electrotyping by book printers for its greater accuracy, and its applicability

to fine engravings in relief. Crude experiments at soldering composed types together and at making duplicates by the pressure of pages on type metal softened by heat were made in the eighteenth century, but the first practical work was done by William Ged, a goldsmith, of Edinburgh, in 1725. His invention was not kindly received by the printers and publishers of England, and soon fell into disuse, but it was revived and improved by Earl Stanhope of London, about the year 1802. For nearly fifty years afterwards it was preferred for book work, and was generally known as the plaster process. The page of type to be stereotyped was put in an iron pan and a preparation of plaster of Paris poured over it, which was afterwards baked dry in an oven. The dried mold so made was then submerged in melted type metal that penetrated every crevice. When properly cooled, the mold was broken, and a duplicate of the composed type appeared on one side of the plate. The rough side of the plate was planed down, its edges were beveled, and faulty letters corrected, until it became a presentable duplicate of the type work. Stereotyping by plaster was brought to Newark by David Bruce in 1813. Stereotypes have also been made by pressing the types upon prepared dampened china clay, but the clay process is rarely used. The papier-maché process, invented by Genoux, of France, in 1829, was neglected for many years, but is now in favor with all daily newspapers. Sheets of thin tissue paper, pasted together and backed with damp unsized thicker paper, constitute the mold or matrix for the papier-maché process. They are firmly and evenly impressed on the page of type, which may be flat or curved, and are then dried upon the page. When dry the matrix is removed, and adjusted to an iron mold on which melted type metal is poured from several openings. The plate so made is then cooled, planed, and beveled to fit the press. All the operations, aided by machinery, are made with great speed. Ten minutes is the ordinary time.

ELECTROTYPING. For fine book work and for duplicating engraved illustrations, electrotyping is the process preferred. By this process the type page is impressed in a thin sheet of wax which is first dusted with a coating of powdered graphite and then with a coating of iron filings. The wax mold so prepared is immersed in a bath containing a solution of sulphate of copper through which passes an electric current from a dynamo. This deposits a thin film of copper on the wax mold. (See **ELECTRO-CHEMISTRY, INDUSTRIAL APPLICATION OF.**) When thick enough to be stable the film or shell of copper is backed with a solder of tin, and afterwards with a firmer basis of type metal, applied in a melted state. This type metal base is then planed and beveled, so that it can be neatly fitted to a thicker base of hard wood that makes it type-high. Electrotypes plates may be curved by passing them through shapers or suitable bending rolls. Electrotypes plates for printing were made by Joseph A. Adams, a wood engraver of New York City, in 1839-41, but they did not supplement stereotype before 1850.

INKING ROLLERS. Printing ink is a trituration (not a chemical union) of boiled oil, smoke black, coloring matter, and other ingredients. By the old process for inking types, stuffed leather balls were made use of, but they were difficult to keep in proper order, and were inapplicable to

cylinder printing. The first improvement on the stuffed balls consisted in covering them with the elastic composition of glue and treacle then employed in the Staffordshire potteries. Catching at this idea, the inventors of cylinder printing machines made inking rollers by casting them in a cylindrical mold. This invention came generally into use between 1814 and 1818, everywhere superseding balls, and rendering printing machinery practicable. Inking rollers for type work, now made of a mixture of glue, glucose, sugar, and glycerin, are found more durable than those made from glue and molasses only. The quantities of each constituent must be varied to suit the speed of the machine, the nature of the presswork, and the temperature of the press-room.

PRINTING PRESSES. The earliest engraving of a printing press shows a stout framework of wood posts, firmly braced against the ceiling to resist upward pressure, a bed plate of stone as a rest for the form of type, which could be exposed to receive ink, and then be slid upon ways under the platen or pressing surface. Impression was given by a large screw of wood over this platen and this screw was moved by a long bar of wood and iron. The sheet of paper to be printed (about 16×20 inches was a common size) was laid upon an inclined framework of wood covered with blanket or parchment, which was hinged to slide on the ways and to be placed under the platen. This platen impressed only one-half of one side of the paper; to print the sheet 16×20 on both sides the pressman had to give four pulls on the bar. To print with uniform margin and in accurate register, the sheet on its

OLD COMMON PRESS.

p, platen; *s*, sole or bed; *t*, tympan; *f*, frisket.

first impression was pierced with small perforations on the front side, and afterwards suspended from holes so made on properly placed points when the second side was printed. Although the mechanism of the press was rude and even petty, good printing was done upon it by a competent pressman. The first improvement in construction was made by Blaew, of Amsterdam, in 1601, who in addition to other devices attached springs to the platen moved by the screw, so that it could have a quick return movement without special exertion from the pressman. In 1786 M. Pierres, of Paris, invented a printing press entirely of iron, and strong enough to print one side of the sheet by one pull of the bar, but it did not meet with favor. About 1804, Earl Stanhope, of Lon-

PRINTING

2. MIEHLE TWO-REVOLUTION CYLINDER BOOK AND MAGAZINE PRESS.

don, made great improvements on the large iron press of Pierres, adding many clever devices of his own for the lightening of labor. In 1806 Koenig, of Saxony, went to London with the model of an improved platen press, which he failed to introduce. His associates were more successful in reviving a patent issued to William Nicholson, of London, in 1790 for printing on a flat surface

son were rejected after fair trial by all book-printers. The old publishing house of Harper & Brothers used hand presses only in 1835, but soon after introduced the Adams power press. A prominent firm of law-book publishers in New York had all their work done on hand presses as late as 1849. The preference for hand-press work has been more marked in Great Britain. The fine books of Pickering and Whittingham and more

GORDON PRESS.

with cylindrical pressure. The new method was fairly tested upon a book form in 1811 and the new machine began to do the regular edition of the *London Times* in 1814. Soon after this all 30 daily newspapers had cylinder presses, for their greater speed and economy were advantages not to be neglected, but book work of all kinds continued to be done on platen presses of new construction. The Columbian Press, invented by

recently those of William Morris and his disciples were printed on a hand press. The hand press was found too slow and the cylinder press too cumbersome and costly for the small forms of commercial printing required before 1850. To supply this demand many small and inexpensive platen printing presses were devised for cards and circulars. In 1840 S. P. Ruggles, of Boston, invented a platen machine that printed a sheet of letter size at the speed of 1000 an hour, power being furnished by the foot of the pressman moving a treadle and attached crank. In 1850 George P. Gordon, of New York, patented a form of

ADAMS BED AND PLATEN PRESS.

George Clymer, of Philadelphia (1816); the Adams Power Press, made in 1830, by Isaac Adams, of Boston; the Washington Press, of Rust, of New York, in 1827, were for many years the favorites. The last two mentioned are yet in daily use in many printing houses of the United States. Cylinder printing machines, the first made, although indispensable to early newspapers, were damaging to type, and for that rea-

son still in use for small job work; (2) the two-revolution cylinder, that rotates at greater speed, and gives impression at every other rotation, is much used for book work; (3) the stop-cylinder, that stops its rotation after each impression, has been preferred for its accurate register and superior printing of engraved illustrations; (4) the double cylinder, that produces two prints from the same form

on each reciprocating movement of the bed, still finds some favor for newspapers of small editions: (5) the perfecting cylinder, that prints both sides of the sheet at the same operation. Other constructions, some of value, could be named, but those here specified are in most favor. The perfecting cylinder last mentioned is the only construction of flat-bed press that attempts to print both sides at once, but its movement is relatively slow. The high speed required by daily newspapers can be had only by the full use of the rotary principle for the pressed and the pressing surfaces. In 1835 Rowland Hill, of England, devised a press on this plan purposed to print upon an endless roll of paper, but his scheme was never put to practical use. In 1850 Thomas Nelson, of Edinburgh, exhibited at the World's Fair a little cylinder which did print a handbill on both sides at great speed from this endless roll. It was not favorably regarded as a practicable apparatus. In 1685 William Bullock, of New York, constructed a rotary press, which printed from an endless roll, 10,000 copies in an hour. R. Hoe & Co., of New York, had produced in 1847 a type-revolving printing machine.

is fed from three rolls of paper and can print, cut, paste, fold, and count 24,000 papers of 14, 20, or 24 pages each, 36,000 papers of 16 pages each, 48,000 of 10 or 12 pages each, and 72,000 of 8 pages each during every hour of its daily operation. In 1900 three octuple presses were installed for the *New York Journal*. Each press weighs, when in running order, about 200,000 pounds, and has 11 pairs of printing cylinders, 40 ink-distributing cylinders, 100 composition rollers, 22 ink fountains, 5 sets of oil fountains, and 850 gear wheels.

These presses are operated by electricity, and are 35 feet long, 10 feet wide, and 15 feet high. An 80 horse-power electric motor is required to start one of them from a state of rest until it attains its proper speed, after which it performs its work at a considerably less expense of power.

In these machines five-cylinder color presses are combined with a full black press, which also has extra facilities for turning out fine newspaper work from electrotype plates; consequently half-tone plates and colored illustrations can be printed in connection with the text.

In 1903 a press of still greater dimensions was

HOE FOUR-CYLINDER ROTARY TYPE-REVOLVING PRESS.

In this construction a large central cylinder contained the form of type on a small portion of its circumference, the rest of that circumference being used for the movement of inking rollers. The types were held in place by grooved and rebated column rules and screw clamps. Around this large cylinder were placed at graduated distances 4, 6, 8, or 10 impression cylinders, for each of which separate piles of paper and separate feeders had to be provided. Every revolution of the central cylinder produced from four to ten copies, but these copies were printed on one side only, and this defect limited its value as a newspaper machine. In 1871 R. Hoe & Co. invented a rotary press, which printed on both sides, from curved stereotype plates at the rate of 12,000 an hour. This machine, a favorite at the start, has been reconstructed on new lines with many improvements for the different requirements of eight-page or forty-eight-page newspapers. Two or more distinct machines are geared together in one construction and are known as the quadruple, sextuple, and octuple machines.

A sextuple press built for the *New York Herald* in 1889 is composed of about 16,000 pieces and weighs 116,000 pounds. This press

constructed by R. Hoe & Co., which uses when running at full capacity, eight rolls of paper, each four newspaper pages wide. This machine requires 125-horse power to drive it, and when running at its full capacity consumes in an hour about 70 miles of paper, the width of the roll, or 280 miles of paper of the width of the newspaper page. In addition to the eight rolls of paper already mentioned eight other rolls are in position, so that when any of the rolls run out the roll-carrier may be turned on a turntable, and the new roll of paper quickly pasted to the end of the depleted roll. The running speed of this press is 96,000 papers an hour, four, six, eight, ten, twelve, fourteen or sixteen pages, or 48,000 eighteen, twenty, twenty-two, twenty-four, twenty-six, twenty-eight, thirty, or thirty-two page papers, all delivered, folded to half-page size, pasted, and counted. Other rotary presses of merit are made in this country, and in France and Germany, but they contain no distinctive principle that calls for minute description.

TYPE-SETTING MACHINES. The output of newspaper presses would have been much smaller if type-setting machines had not furnished composed type at greater speed and lower cost. In

PRINTING

HOE DOUBLE OCTUPLE NEWSPAPER PRESS—1903 MODEL

1821 William Church, of Connecticut (but then a resident of London), proposed a method for casting and setting type by one operation with great rapidity, but the machine for this purpose was never put to practical work. In 1853 William Mitchell invented a type-setting machine that was used for many years in the printing house of John F. Trow, of New York, but it was not generally approved. Other machines succeeded, and many had merit. The Mergenthaler or linotype, a complex mechanism that casts composed types in solid lines, is the approved machine for daily newspapers, and is used to some extent for book composition. The Lanston machine by different apparatus casts and composes isolated types with nearly equal speed. Either machine, in the hands of a skilled operator, can produce as much composed type in one hour as was done in a day by the hand compositor. See TYPE-SETTING MACHINES.

PAPER. Improvements in paper-making have been great aids in the development of printing. In 1827 the Fourdrinier paper machine, that produced paper in the so-called endless roll needed for rapid newspaper printing, was introduced in the United States. It made paper of more uniform thickness, of larger size, and at lower price. Cotton rags were used until the supply diminished. In 1860 Henry Voeltner invented a method for grinding soft woods for conversion into paper pulp. His method has been improved by chipping the wood and treating it with suitable chemical agents, which have largely reduced its cost. Book papers that sold for 16 cents in 1850 are now sold for 5 cents or less, but the quality is not so good. See PAPER.

The methods of book and news presswork have been seriously changed. Before 1870 the rough paper then in use had to be dampened before it was thought fit for press, and type work was impressed upon it against a thick woolen or rubber blanket, which produced thick and strong print. This elastic impression was fatal to engravings with close and shallow lines which were choked with ink, to the damage of proper light and shade. Then paper-makers began to provide paper with a smoother surface, and printers undertook to print this paper in its dry state. Soon after, the newly discovered art of photo-engraving, which became common in books and magazines, compelled the making of still smoother paper. To supply this demand, a thin fabric of paper was coated with whitening, which, after proper smoothing or calendering, had a surface as smooth as polished metal. To print photo-engravings on this paper the elastic impression resistance had to be abandoned, and an inelastic resistance of hard cardboard substituted. Under this treatment the delicacy of fine lines in an illustration could be properly preserved; the inelastic resistance improved the appearance of the illustration, but it did not improve the readability of the type work, and it did add to the cost of presswork.

The increasing circulation of magazines that were filled with illustrations compelled the abandonment of the flat-bed cylinder press about 1884. The rotary principle then and now employed in newspaper work had to be adopted, but with finer mechanism nicely adjusted. In 1886 R. Hoe & Co. made for the printing of the *Century Magazine* a rotary press that took on 64 large octavo pages and printed them in a

satisfactory manner and with a speed not possible by any form of flat-bed cylinder.

BIBLIOGRAPHY. The bibliography of printing is very voluminous, and only a few of the principal books treating of the art can be named here: Han-sard, *Typographia* (London, 1825); De Vinne, *The Invention of Printing* (New York, 1878); id., *Historic Printing Types* (ib., 1886); id., *Plain Types* (ib., 1900); id., *Correct Composition* (ib., 1901); Faulman, *Geschichte der Buchdruckerkunst* (Vienna, 1882); Ringwaldt, *Encyclopædia of Printing* (Philadelphia, 1871); Thomas, *History of Printing in America* (Worcester, Mass., 1810, and Albany, N. Y., 1874); Hoe, *A Short History of the Printing Press* (New York, 1902); Bigmore and Wyman, *Bibliography of Printing* (London, 1880-86); *Dictionary of Printing and Bookmaking* (New York, 1891-94); Waldow, *Illustrirte Encyclopædie der graphischen Künste* (Leipzig, 1880-84).

PRINTING-HOUSE SQUARE. (1) A London court, so called from the former office of the King's Printer, which occupied the site. On it stands the office of the *Times*. (2) The open square fronting on City Hall Park, New York, about which are grouped the buildings of most of the daily newspapers.

PRINTZ, JOHAN (c.1600-63). A Governor of New Sweden. He was born in Bottneryd, Sweden, about the year 1600. He served as a cavalry officer in the Thirty Years' War, and for having surrendered the Saxon town of Chemnitz was dismissed from the service, but in 1641 was restored to royal favor, was ennobled, and was appointed Governor of New Sweden. He reached Fort Christina in 1643, and desiring to control the trade of the river and be as close as possible to the Dutch at Fort Masson, he established a settlement on the island of Tinicum, a few miles below the site of Philadelphia, and built a fort and also a mansion called 'Printz Hall.' His administration was a vigorous one, and during it the colony increased in numbers and in prosperity. He caused other forts to be built at various places for the protection of the colony, carried on a large trade with the Indians, and successfully maintained himself against the English and the Dutch. He quitted the colony in 1653, and two years later it was conquered by the Dutch under Stuyvesant. When Printz reached Sweden he was made a general, and a few years later became Governor of Jönköping. Consult: Winsor, *Narrative and Critical History of America* (8 vols., Boston and New York, 1889); and Brodhead, *History of the State of New York* (2 vols., New York, 1853-71).

PRIOR. See MONASTERY.

PRIOR, MATTHEW (1664-1721). An English poet and diplomatist, born July 21, 1664, probably in Wimborne, Dorsetshire, where his father was a joiner. The family moved to London, and the young Prior was placed in Westminster School, where he formed a life-long friendship with Charles Montagu, afterwards Earl of Halifax. He graduated B.A. from Saint John's College, Cambridge (1686), and was elected fellow (1688); through the influence of the Earl of Dorset he was made secretary to Lord Dursley, Ambassador to The Hague, where he remained several years, enjoying the friendship of King William III.; secretary in the negotiations at

the Treaty of Ryswick (1697); secretary to the Embassy at Paris (1698); secretary to the Board of Trade (1699); sat in Parliament (1701); and soon after forsook the Whigs for the Tories. He had a hand in the negotiations preliminary to the Peace of Utrecht, and was for a short period Ambassador at Paris; on the advent of the Whigs to power he was impeached and imprisoned for two years (1715-17). His last years were passed at Down-Hall, in Essex. He died September 18, 1721, and was buried in Westminster Abbey.

Prior gained recognition among the wits by *The Country-Mouse and the City-Mouse* (1687), written in conjunction with Charles Montagu. It is a readable travesty on Dryden's *Hind and Panther*. In 1700 he published a panegyric on King William, called *Carmen Seculare*. While in prison he amused himself with a long whimsical poem, entitled *Alma; or the Progress of the Mind*. A collection of his poems appeared in 1709, and another in 1718; the latter brought him four thousand guineas. Prior's short poems, comprising odes, epistles, and epigrams, are among the choicest specimens of English occasional verse. We may cite "To a Child of Quality Four Years Old," "The Merchant," "A Better Answer," "A Song," "To a Lady," and "For My Own Tomb-Stone." His verse tales have perfect grace. Consult the *Selected Poems*, ed. by Dobson, Parcliment Library (London, 1889); and the edition by Johnson in the Aldine series (London, 1892); and Thackeray's *English Humorists* (London, 1853).

PRIPET, prĕp'ĕt (Russian *Pripyat*). A river of Western Russia, the largest right tributary of the Dnieper. It rises in a group of lakes and marshes in the Government of Volhynia, near the boundary of Poland, and flows eastward through Volhynia and Minsk, then southeast into the Government of Kiev, where it joins the Dnieper some distance above the town of Kiev (Map: Russia, C 4). For the greater part of its course of 500 miles it flows through immense marshes and forests, which are almost uninhabited, and through which the river and its branches form a network of side channels and backwaters. The Pripet is navigable to Pinsk, and is connected by canals with the Vistula and the Niemen.

PRISCIAN, prĭsh'an (Lat. *Priscianus Cæsariensis*). A Latin grammarian, perhaps, in point of reputation, the first of Latin grammarians, though one of the last in point of time. He belongs probably to about the early part of the sixth century, for he is mentioned by Paulus Diaconus as a contemporary of Cassiodorus. He taught Latin at Constantinople, probably at the Imperial Court, for he enjoyed a Government salary. The work which has mainly preserved his name is his *Commentariorum Grammaticorum Libri XVIII.*, dedicated to his patron, the Consul Julianus. The first sixteen books treat of the different parts of speech as conceived by the ancients; the remaining two are devoted to syntax, and in one manuscript bear the separate title of *De Constructione Libri Duo*. Priscian's Commentary is, for the time, a solid and comprehensive work, the production of a man of great learning and good sense, and is enriched with quotations from many Greek and Latin authors no longer extant. The epitome executed by the German

bishop, Rabanus Maurus, in the ninth century, was very popular in the Middle Ages. Besides the Commentary, Priscian wrote six smaller grammatical treatises, and two didactic poems in hexameter, *De Laude Imperatoris Anastasii*, and a free translation of the *Periegesis* of Dionysius. The first edition of the grammar appeared at Venice (1470); the best is that by H. Keil (Leipzig, 1884). The two poems will be found in vol. v. of Baehrens's *Poetæ Latini Minores* (Leipzig, 1883).

PRISCILLA and **AQUILA**. The names of two persons, wife and husband, connected with the personal work of Saint Paul and the early history of the Christian Church. The name Priscilla is a diminutive from the original Prisca, in which form it is found in the best texts in the three references to her in Saint Paul's Epistles. Her husband, Aquila, is described in Acts xviii. 2 as "a man of Pontus by race, lately come [to Corinth] from Italy, with his wife Priscilla, because Claudius had commanded all the Jews to depart from Rome." This decree was promulgated in A.D. 52. Like Paul, they were tent-makers by trade (Acts xviii. 3). It seems very probable that Aquila and Priscilla had accepted the Christian faith before leaving Rome; if so they were among the earliest believers there, and may have given Paul his information concerning the conditions obtaining among the Roman Christians (Rom. xvi. 17-19). They remained with Paul eighteen months after reaching Corinth, went thence with him to Ephesus, and tarried there while he went on to Jerusalem (Acts xviii. 11, 18, 19, 20). From there they returned later to Rome (Rom. xvi. 3). Still later they were at Ephesus again (II. Tim. iv. 19). These changes are quite consistent with the shifting character of Jewish life at the time, and with their function as missionaries of the new faith. They were regarded most affectionately by Saint Paul, who reckoned their service as hazardous and precious. There are no reliable sources of information concerning the close of their lives. The name of Priscilla (Prisca) figures quite largely in later tradition. There is a church in Rome bearing her name; a volume of *Acts of Saint Prisca* goes back at least to the tenth century; and one of the oldest catacombs in Rome is called *Cæmeterium Priscille*. The reason why the wife's name is placed first in so many cases has not yet been fully cleared up. The names of these two early Christians have recently become more prominent through the interesting hypothesis, put forward by Prof. Adolf Harnack of Berlin, in 1900, that the authors of the Epistle to the Hebrews were Aquila and Priscilla. Consult Sanday-Headlam, *Epistle to the Romans (International Critical Commentary, New York, 1899)*.

PRISCILLA. The heroine of Longfellow's *Courtship of Miles Standish*, wooed by John Alden for his friend Standish, but won for himself.

PRISCILLIAN (Lat. *Priscillianus*) (?-385). A Spanish Christian of prominence, who, while still a layman, started a reform movement with the view of deepening religious life and encouraging asceticism. He afterwards entered holy orders and was made Bishop of Avila, in Central Spain. His theology diverged from orthodoxy at some points, and in the end he was

charged with holding Gnostic, Manichean, and other heresies, although he himself disavowed the opinions of Manes. He seems, however, to have held peculiar views respecting the influence of the heavenly bodies upon men. He believed that the Church still possessed the gift of prophecy, and he gathered his followers into private assemblies, which lent color to the charge of sectarianism, later brought against him. A council at Saragossa (380) reproved the ascetic and separatist tendencies of the day, although without mentioning Priscillian by name, and a controversy ensued. His views were soon carried over into the Gallic Church, and within eight or ten years of its first appearance the party included several bishops and a large number of the clergy. In the course of the controversy Priscillian appealed to Pope Damasus (c.382), and further appeals to the Emperor were made by both parties. After Priscillian had protested against the jurisdiction of a synod convened at Bordeaux (384), he was tried before a civil tribunal, condemned for sorcery, and put to death, along with six others, by the Emperor's command. The Priscillianists continued for some time longer in a state of schism, and are found even as late as the sixth century. The literary remains of Priscillian are published in the *Corpus Scriptorum Ecclesiasticorum Latinorum*, vol. xviii. (Vienna, 1889).

PRISHTINA, prěsh'tě-nà. A town of European Turkey. See PRISTINA.

PRISM (Lat. *prisma*, from Gk. *πρισμα*, *prism*, something sawed, from *πριω*, *pricin*, *πριω*, *prizein*, to saw). A polyhedron (q.v.) two of whose faces (the bases) are equal polygons and whose lateral faces are parallelograms. When the lateral edges are perpendicular to its bases, the prism is called a *right prism*, otherwise *oblique*. A *regular prism* is a right prism whose bases are regular polygons. A prism whose bases are parallelograms is called a *parallelepiped* (q.v.). The volume of any prism equals the product of the base and the altitude. Consult Holzmüller, *Elemente der Stereometrie* (Leipzig, 1902).

PRISM, DISPERSIVE EFFECT OF. See LIGHT; DISPERSION.

PRISMATOID (from Gk. *πρισμα*, *prisma*, prism + *ειδος*, *eidōs*, form). A polyhedron (q.v.) which has for bases any two polygons in parallel planes, and for lateral faces triangles or trapezoids which have one side in common with one base, and the opposite vertex or side in common with the other base. Consult Holzmüller, *Elemente der Stereometrie* (Leipzig, 1902).

PRISON ASSOCIATION OF THE UNITED STATES, NATIONAL. An organization of prominent philanthropists interested in the subject of prison discipline reform, founded in Cincinnati, Ohio, in 1870, under the presidency of Governor Rutherford B. Hayes. The association was incorporated in New York State in April, 1871, the charter being granted to Governor Horatio Seymour (then and until his death president of the association) and twenty-four associate members. The management is in the hands of a board of directors, from which an executive committee of seven members is chosen annually, which discharges the active duties of the board

between the annual meetings. The other standing committees are on criminal law reform, police, prison discipline, discharged prisoners, juvenile delinquency. There is also a volunteer committee of correspondence for reform and aid of discharged prisoners in the various States.

PRISON BREACH, or PRISON BREAKING. The act by which a person escapes by force and violence from a place where he is confined in lawful custody. The act is a misdemeanor, and to constitute it there must be a lawful commitment, an actual breaking of the prison by force and violence by the prisoner or by others in his behalf and by his procurement, and he must fully escape, although, of course, subsequent recapture does not affect his act of breach. Similar escape by the violence of others without his procurement is a *rescue*. Consult the authorities referred to under CRIMINAL LAW.

PRISONER. Any person who is confined, or restrained in his liberty, against his will; a person subjected to imprisonment. The term is ordinarily used to designate persons whose bodies have been attached or seized in criminal or quasi-criminal proceedings and persons who are captured in war. For further information as to prisoners in the general and ordinary legal usage, see such titles as IMPRISONMENT; FALSE IMPRISONMENT; ESCAPE; PRISON BREACH; ATTACHMENT; BAIL; RECOGNIZANCE, etc. The rights of prisoners of war have changed greatly for the better within comparatively recent historical times. Among the Greeks and Romans, and for many centuries before and since, prisoners of war were the property of those by whom they were captured, and might be slain, kept as slaves, or sold at the caprice of their captors. This is still the case among savage races and among some of the semi-civilized races of the Orient. A mind picture of the treatment accorded to prisoners of war in early antiquity among all the races of the East is given by the accounts of the Jewish victories in the Old Testament. The custom of ransoming, and later when mercenaries and professional soldiers were largely used mitigated the hardships of the prisoners. The modern humane doctrine as to the rights of prisoners of war is laid down in the rules made by the Brussels Conference in 1874, which have been generally accepted. Under these a prisoner of war is a lawful combatant captured in war, and such non-combatants, as guides, balloonists, telegraph operators, and others who are identified with the army and rendering it direct service, and important public officials. Surgeons and chaplains, and, now, the hospital attendants of the Red Cross Society are exempt as such from being prisoners of war. A prisoner of war has no protection from the laws of the State and civil remedy; but he is protected by the rules of war against unlawful acts against his person. For further information consult such titles as WAR, LAWS AND USAGES OF; RANSOM; BRUSSELS CONFERENCE; ALIEN; INVIOABILITY; etc. Consult the authorities referred to under INTERNATIONAL LAW.

PRISONER OF CHILLON, THE. A poem by Byron (1816), founded on the history of François de Bonniard, a Genevese imprisoned by Charles, Duke of Savoy, in the Castle of Chillon, on the Lake of Geneva, from 1530 to 1536.

PRISON LABOR. Labor done by convicts or misdemeanants in prison. See CONVICT LABOR.

PRISONS (OF, Fr. *prison*, from Lat. *prænsio*, seizure, from *prendere*, *prehendere*, to seize, take, from *præ*-, before + *-hendere*, Gk. *χαραδύειν*, *chardancin*, to seize; connected with Goth. *bi-gitan*, to find, OHG. *firgezzen*, Ger. *vergessen*, to forget, AS. *gitan*, Eng. *get*). Prisons have been used from antiquity as places of detention or seclusion, but only in modern times as places of punishment for crime. Of the former class were the famous Tower of London, the Bastille of Paris, the Bicêtre, the Seven Towers of Constantinople, and the Castle of Spielberg in Austria. In the sixteenth century workhouses were erected in England, and also on the Continent, to which vagrants were committed; London (1550), Amsterdam (1588), Nuremberg (1588). There was at first little classification, and conditions were bad. Gradually, however, improvements were introduced. The rules and regulations necessary to the sheltering and employment of vagrants developed into prison discipline, while the necessity for classification led to the development of prison architecture. Imprisonment under the new conditions came to be viewed in a different light, and thus became a recognized punishment for crime.

Prisons were first looked upon as a possible means of reformation in 1704, when Pope Clement XI. established the Hospital of Saint Michael at Rome. This was not strictly a prison, but in the criminal wards the plan was introduced of having separate cells at night with work in common by day, silence being maintained. This plan is the basis of what is now known in America as the Auburn plan. A prison which became the architectural prison model for Western Europe and America was constructed at Ghent in 1773. The cells were in blocks, tier upon tier, radiating from a central octagon. The corridors were thus against the outer walls. This probably suggested the form of the Eastern Penitentiary at Philadelphia, in which, however, the corridors were placed in the centre of the blocks of cells, as at Saint Michael's. These plans, which make the entrance to each cell visible from the central room, have been adopted in many later prisons. Beccaria (q.v.), in his great treatise on *Crimes and Punishments* (1764), protested effectively against barbarous punishments, and John Howard (q.v.), who spent sixteen years in visiting the prisons of Europe, was able to effect radical changes in the prison régime of England. Two plans were henceforth followed. In one the prisoners are separated. They eat, work, and sleep in their cells apart from all other inmates. This is theoretically the policy of the Eastern Penitentiary of Pennsylvania and that adopted in Europe. By the other plan, the men have separate cells, but work, and often dine, together. This is the common plan in America. In either case much of the corrupting influence attendant upon the intermingling of prisoners is to a large extent avoided. Early prison conditions in America were exceedingly bad. At Simsbury, Conn., an abandoned copper mine was used as a State prison from 1773 to 1827. Reform began with the building of the Eastern Penitentiary at Philadelphia in 1817 and the Auburn State Prison of New York (1816), which became the

models for American prisons. Between the two systems fierce rivalry arose, but after many trials the Auburn plan has been generally adopted. With the introduction of steam heat, electric lights, and modern sanitary conveniences, prisons have been greatly improved. About the prisons are usually high walls on which guards are stationed, while the electric lights make undetected escape over the walls by night extremely difficult.

Prison management and discipline have not kept pace with mechanical improvements. The old forms of torture and barbarous punishment have, however, disappeared, while escapes are relatively infrequent. In the larger institutions there is great reluctance to tolerate idleness, which is always found to be demoralizing in the extreme. The question as to the proper occupation of the convict, however, is difficult of solution. (See CONVICT LABOR.) Inefficient management often destroys many of the good influences which modern penology demands shall surround the prisoner. Trained men are more and more needed both for efficient financial management and for wise discipline.

Places of imprisonment in the United States include 'lock-ups,' jails, and prisons proper. In each town or city are local 'lock-ups,' 'calabooses,' or 'police stations' for the detention of arrested persons pending immediate trial before the magistrates. Persons convicted of misdemeanors are confined in the county jails or houses of correction. Presumptive felons, bound over to the grand jury, are kept in the county jails pending trial, and then, if sentenced, are confined in the State penitentiaries. United States prisoners are usually kept in State institutions, as the general Government maintains only a few prisons. As a rule, county jails are breeding places of crime. The houses of correction are better managed. Few county jails provide work for prisoners. In some of the States the prison system is not yet well worked out. These institutions are for adults. There are also reformatories (q.v.) for younger delinquents. There is a general feeling that local jails should be given up, and that all prisoners should be under State control, as in England, where the general Government assumed control of all prisons in 1878.

The question of prison reform has received much attention in America as well as in Europe. The National Prison Congress, the National Conference of Charities and Correction, as well as local organizations, have had great influence in the past in bringing about improvements. The meetings of the International Prison Congress (q.v.) have been of great value. Consult: *International Prison Congress, Prisons and Reformatories at Home and Abroad* (London, 1872); Wines, *State of Prisons in the Civilized World* (Cambridge, 1880), a very useful compendium of facts; id., *Punishment and Reformation* (New York, 1895), an historical sketch of the rise of the penitentiary system; Barrows, *Prison Systems of the United States* (Washington, 1900); and id., *The Reformatory System in the United States* (ib., 1900). See CRIMINOLOGY; CONVICT LABOR; JUVENILE OFFENDERS; PENOLOGY; PUNISHMENT; REFORMATORIES.

PRISREND, préz'rënd. The capital of the Vilayet of Kosovo, European Turkey, situated on a small alluvial of the Drin, 75 miles east of Scutari (Map: Turkey in Europe, C 3). It is one of the most beautiful, richest, and most industrious towns in European Turkey. It has a citadel situated 1100 feet above sea-level, and a large number of bazaars, and carries on an active trade in flints, saddlery, glass, and copper and steel wares. Among its edifices are twenty-four mosques. The town is the seat of a Catholic archbishop, a Greek metropolitan, and a Servian theological school. Population variously estimated at from 30,000 to 60,000.

PRISTINA, prësh'tè-nà, or **PRISHTINA**. A town in the Vilayet of Kosovo, European Turkey, 30 miles north-northeast of Prisrend (Map: Turkey in Europe, C 3). It has several mosques and churches, and a Greek Catholic school. Population, 18,000, mostly Mohammedans.

PRITCHARD, CHARLES (1808-93). An English astronomer, born in Alberbury, Shropshire. He was educated at Christ's Hospital and at Saint John's, Cambridge. From 1834 to 1862 he was head of Clapham Grammar School, and in that period became a prominent member of the Royal Astronomical Society. Elected Savilian professor of astronomy at Oxford in 1870, he planned the new observatory, invented the wedge photometer about 1881, and in 1885 published *Uranometria Nova Oæoniensis*, a photometric catalogue for which in 1886 he received half of the Astronomical Society's medal. The measurement of stellar parallax by photography seems original with Pritchard. He died very soon after undertaking a share in the international stellar chart. He contributed to the *Encyclopædia Britannica*, and wrote *Occasional Thoughts of an Astronomer on Nature and Revelation* (1889).

PRITCHARD, MRS. HANNAH (1711-68). An English actress. She was found in 1733 singing in a booth at a public fair; from that time she appeared at the Haymarket and other London playhouses till, for the last twenty years of her life, she became a member of Garrick's company at Drury Lane. Though lacking in cultivation, she was an actress of great gifts in both comedy and tragedy. She played Cleopatra in *All for Love*, Zara in *The Mourning Bride*, and many other noted characters of the time. Her last appearance was in Lady Macbeth, her most famous rôle, in which only Mrs. Siddons could surpass her. A few months after her retirement, in 1768, she died at Bath, wealthy and universally respected. Consult: Doran, *Annals of the Stage* (ed. Lowe, London, 1888); Russell, *Representative Actors* (London, n.d.).

PRITCHARD, JETER CONNELLY (1857-). A United States Senator and jurist, born at Jonesboro, Tenn. He received an academic education at Martins Creek Academy, and was apprenticed to a printer. In 1873 he removed to Bakersville, N. C., where he worked at the printers' trade and became editor of the *Roan Mountain Republican*. He was a member of the Legislature in 1884, 1886, and 1890, and was admitted to the bar in 1887. He was the Republican candidate for Lieutenant-Governor in 1888, and the nominee of his party for United States Senator in 1892. The same year he was defeated for the Lower House of Congress, but helped to

bring about a fusion of Populists and Republicans on State affairs which was successful in 1894. He was elected to the United States Senate in 1895 for an unexpired term, and in 1897 was reelected for six years. As the only Republican Senator from the Southern States his influence was great. He was one of the leaders in the attempt to build up a white Republican party in the South, the so-called Lily-White movement, claiming that as the negro had been deprived of his vote in many of the States, it was unfair that he should control conventions and keep away desirable recruits from the ranks of business men. On the expiration of his term in 1903 he was appointed associate justice of the Supreme Court of the District of Columbia.

PRITCHETT, HENRY SMITH (1857-). An American astronomer, born in Fayette, Mo. After his graduation from Pritchett College, Glasgow, Mo., in 1875, he went to Washington to study practical and theoretical astronomy under Professor Asaph Hall in the United States Naval Observatory, where he became assistant astronomer in 1878. Two years afterwards he was appointed to the same position in the Morrison Observatory, Glasgow, Mo. He was sent to New Zealand in 1882 to observe the transit of Venus, and in 1883 was made professor of astronomy at Washington University, Saint Louis, Mo., and director of the observatory there. Six years afterwards he went to California in charge of the Government expedition for viewing the solar eclipse. He was superintendent of the United States Coast and Geodetic Survey, with headquarters at Washington, in 1897-1900, and was then elected president of the Massachusetts Institute of Technology, Boston.

PRITHU, prith'hoō. The name of several legendary kings of ancient India, especially one who is a hero in the Puranas (q.v.). His father was Vena, who was slain on account of his impiety. As Vena had left no offspring, and the kingdom consequently had no ruler, the sages assembled and consulted how to produce a son from the body of the dead King. First they rubbed his thigh, from which came forth a being called Nishada. By this means the wickedness of Vena was expelled. They then proceeded to rub the right arm of the dead King, and by this friction Prithu came forth, having in his right hand the mark of the discus of Vishnu, which destined him to be a universal emperor, whose power would be invincible even by the gods. Prithu soon removed the grievances of the people. He protected the earth, performed many sacrifices, and gave liberal gifts to the Brahmans, thus undoing his father's wickedness. During the interval in which the earth had been without a king, all vegetable products had been withheld, and consequently famine raged. He therefore marched against the earth, which, assuming the figure of a cow, fled from him. Seeing no escape, she at last promised to renew her fertility if he would make the world level. Prithu therefore uprooted mountains, and induced his subjects to take up their abodes where the ground had become a plain. The earth now fulfilled her promise; and as Prithu, by granting her new life, became, as it were, her father, she was henceforth called Prithivi.

PRIVAS, prè'vâ'. The capital of the Department of Ardèche, France, 43 miles northwest

of Orange by rail (Map: France, L 7). The town is built upon a ridge overlooking the valley of the Ouyèze, at the foot of the Coiron Mountains, and has a fine esplanade shaded with plane-trees, opening upon a panorama of great extent and beauty. It has important iron mines, the ore of which is exported, and it manufactures silks, woolens, leather, and brandy. Its buildings are unimportant. It was a Huguenot stronghold and was destroyed in 1629 by order of Louis XIII. and Richelieu. Population, in 1901, 7561.

PRIVAT-DOCENT, *prê-vât' dô-tsënt'* (Ger., private teacher). A private instructor in German and some other European universities. The privilege to thus offer instruction is acquired by promising scholars, holding the doctorate, after having gone through the process technically known as 'habilitation.' This process consists in publicly defending a scientific dissertation embodying the results of the candidate's original research. Usually the privat-docent draws his fees from the students.

PRIVATE (Lat. *privatus*, individual, p.p. of *privare*, to separate, from *privus*, one's own, from *præ*, OLat. *prai*, before). In the United States Army, all enlisted men, except the non-commissioned officers, are termed privates. See ARMY ORGANIZATION; and for pay, see PAY AND ALLOWANCES.

PRIVATE BILL. A technical term, employed to designate a bill introduced into the English Parliament for the benefit of one or more individuals, corporations, cities, or a particular locality, as distinguished from a general bill or act affecting the entire country or community. In the United States a measure affecting individuals is usually called a special act. See BILL; LEGISLATION; STATUTE.

PRIVATEERING. One of the usages of war according to which private individuals are authorized by the Government of one belligerent to fit out at their own expense vessels of war designed to prey upon the commerce of another belligerent. A privateer is an armed vessel fitted out for this purpose, owned and officered by a person or persons acting under a commission usually called a letter of marque (q.v.). Before granting such a commission it is usual to require the lodgment of caution money or the execution of a bond by way of security against illegal conduct. Citizens of the United States are forbidden by statute to accept letters of marque from powers at peace with the United States, and this is a general rule among nations. The commission is revocable upon proof of abuse, and according to English law the holder is liable in damages. As a further safeguard, a privateer is always subject to visitation and search by public vessels of war with a view to the verification of the genuineness of the commission under which it sails.

The practice of privateering is an old one among nations. In Europe it runs back to the time when public navies had not come into existence. During the Middle Ages, European States having few or no ships of war hired merchant vessels for the uses of war, and eventually the practice of issuing commissions to persons who owned ships or could procure them, authorizing them to prey upon the commerce of the enemy, came into general use. By way of compensation the person so commissioned was

allowed a share of the booty which he might capture. Such means enabled an inferior maritime power to call into existence on brief notice and at little or no expense a temporary force sufficient to enable it to cope with a more powerful rival. It was by this means that the Southern Confederacy during the Civil War drove the merchant marine of the United States from the high seas and seriously crippled its commercial interests. The practice is still sanctioned by international law, but it is rapidly falling into disfavor, and is not likely to be again extensively resorted to by any civilized nation. In the first place, a privateering force is never available for general naval operations, being restricted to the capture of unarmed merchant vessels. Secondly, the control over privateers is at most slight. Those who engage in the privateering service are often bold, adventurous, and sometimes lawless men, who tend to become robbers, since their motive is plunder and their reward booty. The belligerent employer of such persons has but little or no security against their aggressions upon neutral commerce, although he is held strictly responsible.

As the rights of neutrals increase, the disadvantage of employing this method of naval warfare becomes more potent. States having small navies find it possible upon the outbreak of war to increase their naval strength by purchasing or chartering ships. See DECLARATION OF PARIS.

PRIVATE SECRETARY, THE. A farce adapted by William H. Gillette from Von Moser's *Der Bibliothekar*, produced as *Digby's Secretary* in 1884, simultaneously with another adaptation, *The Private Secretary*, by Hawtrey, under A. M. Palmer. The best parts of each were combined later in the present form.

PRIVET (probably a corruption of *primet*, apparently from *prim*, privet, from Lat. *primus*, first, so called in allusion to its early bloom), *Ligustrum*. A genus of shrubs and small trees of the natural order Oleaceæ. Common privet (*Ligustrum vulgare*), a shrub growing in bushy places and about the borders of woods in the middle and south of Europe, is naturalized in some parts of North America. It has half-evergreen, smooth, lanceolate leaves, and black, rarely white, yellow, or green berries about the size of peas. The flowers have a strong and sweetish smell. The berries, which persist during winter, have a disagreeable taste, but serve as food for birds. They are used for dyeing. A rose-colored pigment obtained from them is used for coloring maps. The hard wood is used by turners and for making shoe pegs. Privet, though spineless, is much used for hedges, since it bears clipping well, and withstands the smoke and shade of towns. It is not hardy in Iowa and adjoining States, though introduced Russian forms seem able to withstand the winters. The so-called California privet (*Ligustrum ovalifolium*), a native of Japan, is one of the best varieties for hedges. Some species, natives of the East, have been introduced into American shrubberies. All species grow readily from cuttings.

PRIVET WEBWORM. The larva of a pyralid moth (*Diaphania quadristigmalis*), which feeds upon privet hedges in the United States. The soft, light-green eggs are fastened to the leaf near its midrib in clusters of fifty or more. The light-green caterpillars hatch in

early summer and feed upon the young leaves, hiding themselves in silken webs either between the upper leaves when still quite small, or lower down on the older leaves when fully grown. After three weeks they transform to the chrysalis condition within silken cocoons in folded leaves. The best remedy consists in trimming the hedge at the proper time, and afterwards applying an arsenical spray.

PRIVILEGE (Lat. *privilegium*, prerogative, from *privus*, one's own + *lex*, law). In law, a benefit or immunity growing out of some special rule of law or statute by virtue of which an individual or a class enjoys certain immunities or rights distinct from or beyond the provisions of law generally applicable to the community. It differs from a *dispensation* inasmuch as the latter merely relaxes the existing law for a particular case or cases, while the privilege is a permanent and general right. Of ancient and mediæval legislation the law of privilege formed an important branch, the so-called privileged classes being governed by a substantially different body of law from the other classes of society. In early law there were two privileges enjoyed by the clergy which deserve special notice from the frequency of the historical allusions to them—the 'privilege of the canon' (*privilegium canonis*) and the 'privilege of the forum' (*privilegium fori*). By the former the person of the clergyman, of whatever degree, was protected from violence by the penalty of excommunication against the offender; by the latter—known in England as 'benefit of clergy' (q.v.)—the clergyman upon claiming his privilege was exempted from trial by the ordinary civil tribunals, and could only be tried in the ecclesiastical court. Early English statutes placed limitations upon this latter privilege, and it was finally completely abolished. (See **BENEFIT OF CLERGY**.) In modern law there is scarcely any trace of the various form of class legislation which characterized the Middle Ages, and in most, if not all, of the States, class legislation is restricted by their respective constitutions. Privileges in the legal sense so far as they exist at all in modern law rest upon grounds of public policy, and in certain cases in the United States are sanctioned and protected by provisions of the State and Federal Constitutions.

Some forms of privilege have been considered in connection with other topics, in the law of which they constitute an essential part. Thus for a discussion of *privileges of witnesses*, that is, the circumstances under which witnesses are privileged from giving testimony, see **EVIDENCE**; **WITNESS**. For a discussion of the privilege which exempts one from liability for libel and slander, see **LIBEL**. See also **MONOPOLY**, and for the special privileges accorded to ambassadors and diplomatic agents by international law, see those topics respectively.

PRIVILEGES OF LEGISLATORS. It is essential to the maintenance of free government that members of legislative bodies should be privileged from arrest, both civil and criminal, during the term or session of the legislature, and for a reasonable time before the beginning and end of the session, and that they should not be called to any legal account for any language uttered by them during the course of their legis-

lative business. Such is the common law relating to members of Parliament. The United States Constitution provides (Art. 1, Sec. 6) that the Senators and Representatives "shall in all cases, except treason, felony, and breach of peace, be privileged from arrest during their attendance at the session of their respective Houses, and in going to and returning from the same, and for any speech or debate in either House they shall not be questioned in any other place." This provision has been substantially incorporated into the constitutions of the several States as applicable to the members of State legislatures.

PRIVILEGES AND IMMUNITIES OF CITIZENS. The Constitution of the United States nowhere undertakes to enumerate the privileges and immunities of citizens of the United States, although the Fourteenth Amendment assumes that there are such, and expressly prohibits the States from making or enforcing any law which shall abridge them. The Civil Rights Act declares that they include, among other things, the right to make and enforce contracts, to bring suit in the courts, to give evidence, to inherit, purchase, lease, hold, and convey real and personal property, and to enjoy the full and equal benefit of all laws and proceedings for the security of person and property. The Supreme Court of the United States in the noted Slaughterhouse cases, decided in 1872 (16 Wallace's U. S. Reports, p. 36), undertook to enumerate some of the more important of the privileges and immunities of United States citizens. According to the opinion of the court, they include a citizen's right of free access to the seat of government of the United States in order to assert any claim he may have upon that Government, to transact any business he may have with it, to seek its protection, to share its offices, to engage in its administrative functions; free access to the seaports, the sub-treasuries, land offices, and courts of justice; protection of life, liberty, and property when on the high seas, or within the jurisdiction of a foreign government; the right to assemble peaceably and petition for redress of grievances; the privilege of the writ of habeas corpus; the right to use the navigable waters of the United States; all rights secured to our citizens by treaties with foreign nations; the right to become a citizen of any State of the Union by a *bona fide* residence therein, with the same rights as other citizens of that State, etc. Of course, no enumeration can be complete, but the one given above is the most exhaustive and authoritative yet made. They include, as the court well says, the rights and privileges which of right belong to the citizens of all free governments. In the decision above cited the Supreme Court declared that there is a citizenship of the United States distinct from that of the State, and that only the privileges and immunities appertaining to United States citizenship are under the guardianship of the national authority, and that those appertaining to State citizenship must rest for their security and protection upon the action of States. With regard to the latter, the Constitution provides that the citizens of each State shall be entitled to all privileges and immunities of citizens in the several States. No complete enumeration of these has ever been attempted. Mr. Justice Washington, sitting in the United States Circuit Court, gave the opinion

that they might all be comprehended under the following general heads: protection by the Government, the enjoyment of life and liberty, the right to acquire and possess property of every kind, the right to pursue and obtain happiness and safety, the right to pass from one State to another for the purpose of trade, agriculture, professional pursuits, or otherwise, the privilege of the writ of *habeas corpus*, the right to maintain actions in the courts, to acquire and hold property, and the right of exemption from higher taxes than are paid by citizens of other States (*Carfield v. Coryell*, 4 Wash. c.c. 371). See also Cooley, *Constitutional Law*, pp. 206-208.

PRIVILEGED COMMUNICATION. A term applied to two distinct classes of statements. First, it denotes communications between parties to a confidential relation, which the law does not force the recipient to disclose as a witness. Examples of this class are statements made by a client to his lawyer, by a patient to his physician, those between husband and wife, those between a party and a witness in preparation of a case for trial, and State secrets. They are frequently called confidential communications. The extent to which they are privileged is generally regulated by statute in our States. Second, the term is also applied to statements which are defamatory, but which do not give to the injured party a right of action. Statements of this sort are of two kinds: absolutely privileged and conditionally privileged. Members of Parliament, of Congress, and of our State legislatures are not to be questioned in any other place than their respective Houses for any speech or debate made therein. (See United States Constitution, Art. 1, Sec. 6). Judges also enjoy an absolute privilege from civil action for anything said or written by them as judges. This rule is not made for the protection or benefit of a malicious or abusive judge, but for the benefit of the public, whose interest it is that judicial officers should be at liberty to exercise their functions with independence and without fear of consequences. Similar considerations of public policy have led the English courts to accord the same absolute privilege to the pleadings of litigant parties, to the remarks of counsel, and the statements of witnesses, in the course of judicial proceedings. In this country, however, the courts have generally held the privilege of such persons to be conditional and not absolute. That is, they are not liable in a civil action unless their defamatory statements are not pertinent or material to the case at issue, and are made in bad faith and for a malicious purpose.

A conditionally privileged communication is a defamatory statement made by a person in the discharge of some public or private duty, whether legal or moral; or in the conduct of his own affairs in a matter where his interests are concerned. The publication of legislative and judicial proceedings by newspapers belongs to this class. So do statements made by a lawyer to a client about the solvency of a third person with whom the client is about to engage in business transactions. Communications by a parent to a daughter of full age about the reputation of a suitor are also in this category, as are the warnings by a master to his servants about the character of a fellow-servant, or the statements of an employer about those who have

been in his service. In all of these, and in similar cases, the plaintiff must show that the defendant uttered the defamation in bad faith and for a malicious purpose, or he will fail in his action. See **DEFAMATION**; **LIBEL**; **SLANDER**. Consult Hageman, *Privileged Communications* (Somerville, N. J., 1889); also authorities noted under **SLANDER**; **LIBEL**.

PRIVILEGED DEBTS. In Scotch law, those debts which must be paid first out of bankrupt's, insolvent's, and decedent's estates, corresponding to the class of debts called preferred claims or debts in the United States.

PRIVILEGED DEED. In the law of Scotland, a holograph deed, which is exempted from the statute requiring deeds to be signed before witnesses.

PRIVY COUNCIL. In England, the assembly appointed by the sovereign to give advice on matters of state. In Anglo-Saxon times the kings had been advised by the Witenagemot, and in Norman times this became the Great Council. Naturally, the kings had more intimate counselors, and they separated in time from the larger body to form the Privy Council. There are traces of such a body as early as the minority of Henry III., but the institution did not become definitely fixed until the minority of Richard II. During the reign of Henry V. the name Privy Council first appears, and in the time of Henry VI. this became the official designation.

The period of the greatest power of the Privy Council was during the infancy of Henry VI. It came into frequent collision with Parliament, which was jealous of its power. Its sphere of action was very wide. As a deliberative body it gave advice to the Crown on political questions. It exercised legislative, judicial, and executive functions. Originally its judicial powers were very great. It frequently assumed cognizance of questions of private right; but in 1640 it was enacted that neither King nor Council should have any jurisdiction in matters regarding the estates and liberties of the subject, which should be tried in the ordinary tribunals of the land. The Star Chamber (q.v.), as it was constituted under Henry VII., was practically identical with the Council, except that the two Chief Justices were included among its members.

After the Restoration the executive and consultative powers of the Council began to decline. Vain attempts were made by Clarendon and later by Sir William Temple to give it new vigor. Since the reign of William III. the Cabinet has gradually appropriated all of the political functions of the larger body of which it is legally a part. The Privy Council has ceased to advise the Crown regarding the government of the realm.

Since 1870 a privy councilor may be either a native or a naturalized subject of Great Britain. The honor is conferred by the sovereign's nomination, without any patent or grant, and is completed by taking the oath of office. Among the large number of members of the Council are now included the princes of the royal family; the two archbishops; the Bishop of London; the judges of the House of Lords, the Judicial Committee, and the Court of Appeals; and all the Cabinet Ministers. The office of privy councilor

formerly fell by the demise of the Crown; but by an act of 1708 the Council continues to exist for six months longer unless sooner determined by the successor. Immediately on the decease of the sovereign, the Council assembles and proclaims his successor, the Lord Chancellor affixing the great seal to the proclamation. The body is styled collectively 'His Majesty's most honorable Privy Council.' The councilors are entitled to the designation 'right honorable' prefixed to their names; and they take precedence next after Knights of the Garter. A council can be held only under the presidency of the sovereign. Every other assembly of the members, though they should all attend, is merely a 'committee.'

The functions of the Council are either carefully defined by statute or they are exercised in virtue of the discretionary prerogative of the Crown. Some of them are of a formal or ceremonial character. In council, for example, a minister takes the official oath, a bishop does homage for the temporalities of his see, and the sheriffs for the counties are chosen. In certain cases of emergency proclamations may be issued in council; and under authority of Parliament Orders in Council (q.v.) have the force of law. Furthermore, the administration of various special laws of Parliament is intrusted to the Council. A large part of the administrative business is transacted in committees, either temporary or permanent. Legally the Cabinet (q.v.) is but a committee of the Privy Council. Other standing committees are the Judicial Committee, the Board of Trade, the Local Government Board, the Educational Committee, the Agricultural Committee, and the Committee for the Consideration of Charters of Incorporation under the Municipal Corporation Act of 1882.

Ireland has a Privy Council of her own; but the Privy Council of Scotland was merged in that of England in 1708.

JUDICIAL COMMITTEE. A high tribunal, composed of certain members of the Privy Council, created by the Act of 3 and 4 Wil. IV., ch. 41, in 1833. It was given jurisdiction of all appeals to his Majesty in council, which at that time included appeals from the High Court of Admiralty in both instance and prize cases, and all appeals from the courts of the colonies. The act also provided that the King might refer any other matters to the committee which he might see fit, and, under this clause, many important questions both legal and political in their nature have been decided by this committee. Members of the Council who are or have been justices of the superior courts of Great Britain and Ireland, comprising the Supreme Court of Judicature in England, the Superior Courts of Law and Equity at Dublin, and the Court of Session in Scotland, were included in the committee. The judges of the self-governing colonies, if members of the Council, are ex officio members of the committee. The Chief Justices of Canada, Cape Colony, and South Australia are now members. When it is considered that appeals from the highest courts of the colonies may involve important constitutional questions as to the powers and limitations of their legislative bodies, matters which to an important extent determine the very nature of the Empire itself, the dignity and importance of this Judicial Committee will be appreciated.

The committee has also jurisdiction over cer-

tain cases arising under the Clergy Discipline acts and petitions for the extensions of the terms of letters patent. By the Judicature Acts (q.v.) all jurisdiction of appeals from the High Court of Admiralty and in lunacy proceedings was transferred and vested in the Court of Appeal.

The forms of a secret council or committee have always been observed by the Judicial Committee, and no publication is made of the views or vote of any member. The judgments or decisions of the committee are transmitted to the sovereign in the form of a report, which embodies the views of the majority only.

EDUCATIONAL COMMITTEE. The committee on education was established in 1839 by an Order in Council for the purpose of promoting educational legislation and administering moneys voted by the Commons for school buildings and teachers' training colleges. The funds thus voted were turned over by the committee to two societies for the encouragement of elementary education among the poor, and provision was made for the inspection of schools by Crown officers. The encouragement of pupil teachers by scholarships in training colleges and the offer of salaries, made possible by the grants of 1846, and the administration of special funds for the increase in the salaries of trained teachers, also devolved upon this committee. The importance of the committee was greatly increased when in 1862 the distribution of moneys in aid of schools was made dependent on the character of their work. The committee of the Privy Council has charge mainly of the disposition of Government grants for public elementary education, the curricula, and the certification of teachers engaged in subsidized schools. The act of 1870 has increased its importance by investing it with the additional power of appointing school boards in cases where existing boards neglect their duties. In 1900 the Education Department, including the Department of Science and Art, was placed under the Board of Education for England and Wales, consisting of the Lord President of the Council, the principal Secretaries of State, and the Chancellor of the Exchequer.

R. Dasent (London, 1890-1901).

PRIVY PURSE, KEEPER OF THE. An officer of the royal household in Great Britain charged with the payment of the private expenses and charities of the sovereign.

PRIVY SEAL. A seal of the British Government, which formerly was affixed to documents that were afterwards to be authenticated by the great seal, or that were of such minor importance as not to require the great seal. The officer who has custody of the privy seal is called the Lord Privy Seal. As early as the reign of

Edward III. he was a member of the King's Council and a responsible minister of the Crown. The adixing of the privy seal was for centuries by the authority of the Lord Chancellor. Until the reign of Victoria, all letters patent, patents of inventions, charters, naturalizations, pensions, creations of honors, pardons, and so on, were required to pass from the signet office to the privy seal office, the signet seal being the warrant for the privy seal, as the latter was for the great seal. By the Great Seal Act, 1884 (47 and 48 Vict., c. 30, s. 3), it was provided that all instruments required to pass the great seal need only have a warrant under the sign manual, countersigned by the Lord Chancellor, Secretary of State, or a high official of the Treasury, and that thereafter no instrument need be passed under the privy seal. The Lord Privy Seal still ranks as fifth great officer of State, usually with a seat in the Cabinet, but there is no salary and no definite functions are now attached to the office. A peer above the rank of a baron is usually appointed; but a commoner is eligible. See GREAT SEAL.

PRIX DE ROME, *pré de rôm* (Fr., prize of Rome). The Grand Prix de Rome is a prize given by the French Government to a certain number of painters, sculptors, architects, musicians, and engravers, who have passed a rigid examination in their respective departments of art. The winner of the Prix has four years at the Villa Medici, the Académie de France à Rome, and the annual sum of about 4000 francs for his expenses; he is also exempt from military service. The competition for the Prix is open to any Frenchman between the ages of fifteen and thirty, who has fulfilled certain conditions in the Ecole des Beaux-Arts (q.v.), or elsewhere. A scheduled length of time is allowed the student in which to make drawings or models of a given subject, for the completed design, and ten pupils from each section are selected to enter the final competition. They have three months in which to prepare their work. The awards are made every year to painters, sculptors, musicians, and architects; every two years to line engravers; and every three years to engravers on fine stones and medalists. The Académie des Beaux-Arts, a section of the French Institute, has charge of the school at Rome, and the 'concours' for the Grand Prix. The director of the Academy at Rome is always a French painter chosen from among the members of the Académie des Beaux-Arts. A series of 'envois,' or specimens of work, are sent each year from Rome to the Salon, to show the pupils' progress. In the case of a musician, the 'envoi' goes to the Conservatory, which possesses autographs of all the prize cantatas since the establishment of the Prix.

The Prix de Rome was founded by Louis XIV. in 1666. Its purpose was to educate promising young painters and sculptors, at the cost of the State, by study of the antique in Rome. The first director of the school was Charles Errard (q.v.). In 1720 architects were also allowed to compete for the Prix. During the Revolution the school was inactive, but Napoleon enlarged it, and after 1803 musicians, medalists, line engravers, and engravers of precious stones were added to the list of 'pensionnaires.' At this date also the school was removed to the Villa Medici, the present site of the Académie de France à Rome. The

artistic value of the Prix de Rome is a disputed question. What was perhaps a necessity in the time of Louis XIV. is now said to have outgrown its use, but, on the other hand, the list of prize-winners in every department during the last century embraces many of the great names of France. Consult Baltard, *Villa Medici à Rome* (Paris, 1847).

PRIZE (OF, Fr. *prise*, fem. sg. of *pris*, p.p. of *prendre*, from Lat. *prendere*, *prehendere*, to seize, take). In international law, a term applied to all captures of property made during the course of war upon the high seas or in the territorial waters of a belligerent. The right to capture both the public property of an enemy on the sea and even the private property of his subjects is recognized by the rules of international law, although the right to capture private property on land has been generally abandoned. The capture of enemy's property cannot be lawfully made in neutral waters, and prizes thus taken must be restored to their owners with such reparation as the neutral Government may demand for the violation of its neutrality. Without authority the act of capture must be regarded as piracy and punishable as such. Since the authority to capture enemy's property is derived from the belligerent Government, it follows that the title of the captor to the prize which he has taken is subject to the disposition of his Government according to law. The Government may therefore vest the title in the captor, or it may appropriate the prize to its own use, or destroy it, or sell it, distributing the proceeds among the captors in such manner as the laws of the State may prescribe.

A question of some importance in the law of prizes is the determination of the exact date when the title passes from the original owner to the captor. The right of the captor to that which undoubtedly belongs to his enemy is complete as between him and his enemy so soon as the capture is complete; but as between him and a neutral State which may lay claim to a whole or part of the prize, further evidence of the lawfulness of the capture must be forthcoming. According to one view, the title passes at the moment at which the capture is definitely effected and all resistance has ceased, as is evidenced by striking the flag or voluntarily surrendering. Others claim that the title vests in the captor after twenty-four hours of secure possession. Still others insist that the capture is complete only when the prize has been carried *infra præsidia* and is thus secure against the possibility of recapture. Whatever may be the correct rule, it would seem that the Government to which the captor belongs has an inchoate title at least from the moment the act of seizure has been accomplished. This title may be contested by a neutral Government on the ground that the capture was made in its waters, or by its subjects, or for other reasons. The inchoate title, therefore, is made complete by having the prize sent in to a port of the captor and the question of the lawfulness of the capture authoritatively determined by a judicial tribunal. (See PRIZE COURT.) To this end it is the first duty of the captor to bring in his prize for adjudication if it is capable of making the voyage, otherwise he should destroy it as enemy's property if there be no doubt as to its character, or sell it and turn over the proceeds to the jurisdiction of the proper court for distribution. Formerly the usages of war per-

mitted the captor to take his prize into a neutral port, but neutrals may forbid the use of their ports for this purpose, if they see fit, and this is almost the invariable practice except in case of distress or other emergency, and then only for as short a time as circumstances will allow.

A prize intended to be sent into port for adjudication is put in charge of a prize-master who is aided by a prize crew. They are charged with taking care that the vessel is not despoiled or damaged and that it is duly delivered to the custody of the court with the ship's papers, register, etc. In order to avoid depletion of the fighting strength resulting from the necessity of supplying prize crews where a number of captures are made, or where for other reasons it may be inconvenient to send a prize into port, it is frequently provided by municipal law and is recognized by the law of nations that a captor may destroy his prize, subject, of course, to the liability of the captor's Government for any loss or injury occasioned to neutrals thereby. The right of the captor to accept a ransom for his prize is also recognized. This is an arrangement between the captor and the master of the captured vessel by which the vessel is allowed to continue its voyage upon the promise of the master to pay a specified sum to the captor. The ransom contract serves as a safe conduct for the vessel during the remainder of the voyage and is a guarantee against capture by another vessel of the captor's Government or that of his ally, but not against the perils of the sea. Ransom contracts are valid instruments under international law, and it is customary to allow either party to bring suit on it in the courts of the other. As a means of encouraging the capture of an enemy's vessels, the laws of many States provide for the offering of special rewards to those taking part in operations leading to the capture of vessels belonging to an enemy. Such is the prize money heretofore allowed by the Government of the United States, which consisted of the proceeds of the sale of captured vessels and cargoes lawfully captured and regularly condemned, and distributed among officers and crew. This provision for prize money, which had been a law of the United States from the establishment of the Government, was abolished by an act of March 3, 1899. By this act all laws authorizing the distribution of prize money as well as for the payment of bounties and head-money were repealed. See ADMIRALTY; CONTRABAND OF WAR; DECLARATION OF PARIS; PRIVATEERING; PRIZE COURTS; RECAPTURE; WAR, LAWS OF.

PRIZE COURTS. Special tribunals for the adjudication of questions of prize (q.v.). The submission of the question of the legality of a capture in war to the determination of a court is not a right which an enemy may claim, since it is assumed that all captures are enemy's property. But the fact that property frequently captured is claimed to be owned by neutrals makes a judicial inquiry in such cases necessary in order to determine the responsibility of a belligerent to neutrals. As the determination of questions of this character involves the exercise of admiralty jurisdiction, it is customary to confer jurisdiction in cases of maritime capture upon the admiralty courts. In Great Britain this is done by special commission; in the United States it is a regular branch of the admiralty jurisdic-

tion, which is exercised in the first instance by the district courts. Prize courts differ from other municipal courts in that jurisdiction over the property of a foreigner is acquired, not by his consent expressed or implied, but by force. A prize court usually sits within the territorial jurisdiction of the belligerent under whose authority the capture is made, although it may sit within the territory of an ally. It may not, however, sit in the territory of a neutral even with the consent of the latter.

It is highly desirable that the court may have the prize within its own custody, not only as a means of facilitating the investigation, but to diminish the risks of concealment and fraud and to insure a fair sale or speedy restitution. The question to be decided by the court is whether, according to the law of nations, the ship and cargo in question were liable to capture, and if so whether the capture was lawfully made. If the decision be in the affirmative, the prize is pronounced good, is then sold and the proceeds placed in the hands of an officer of the Government for distribution among the officers and men who made the capture, according to the provisions of the law governing captures. If the decision be in the negative, the vessel is restored to its owners. If in the latter case it has suffered damage from the hands of the captors, the Government of which the captors are subjects is held responsible only for failure to use reasonable care and skill.

The procedure in prize cases is based chiefly on the principles of the Roman law. The common-law doctrine as to the competency of witnesses has no application in the procedure of prize courts. The decision of a prize court is binding upon all parties concerned, but, on account of the magnitude of the interests often involved, provision is usually made in the municipal law of every State for the right of appeal to a higher court. Thus in the United States appeals from the decisions of the district courts lie to the United States Supreme Court.

PRIZE FIGHTING. In law, fighting with the fists, either with or without gloves, in public, and for some reward or prize. It is sometimes said that there must be an intention to fight 'to a finish' in order to constitute a prize fight, but the practice of fixing a limited number of rounds, in order to ostensibly make it a sparring exhibition, has necessitated the adoption of a different rule. The question of the intention of the parties and the promoters of the fight is important. If the intention is for either of the contestants to 'knock out' the other or disable him, and the fight is a public exhibition for money or a prize, it will be considered as a prize fight. The manner of distribution of the prize money between the contestants is immaterial. A prize fight differs from a sparring match in that the latter is not held for a prize, and there is no intention on the part of the contestants to do each other bodily harm. Most of the States define and prohibit prize fighting by statute. See PUGILISM.

PRJEVALSKY, przhá-vál'skè, NIKOLAI. See PRZHEVALSKI.

PROA. See CATAMARAN.

PROBABILISM (from Lat. *probabilis*, probable, from *probare*, to test, examine, from *probus*, good, Skt. *prabhu*, preëminent, from *pra*, before + *bhū*, to be). In Roman Catholic theology, the

doctrine regarding the use of so-called 'probable opinions' in guiding the conscience as to the lawfulness or unlawfulness of any particular action. The word came prominently into discussion in the seventeenth century and seems now fully accepted as a technical name. As the ground of the doctrine, it is assumed that, in human actions, absolute certainty is not always attainable as to their lawfulness or unlawfulness. Short of this certainty, the intellect passes through the stages of 'doubt' and of 'probability.' In the former, it is swayed between conflicting views, so as to be unable to decide, or even to approach toward deciding, what is true. In the latter, although there is a conflict of views, yet the reasons in their favor are not so equal that the intellect cannot see preponderating motives in favor of the truth of one or of the other. Moreover, in the conflict of views, another element will arise, as to their comparative 'safety,' that is, the greater or less danger of moral culpability which they involve; and this greater or less moral 'safety' of a view may or may not coincide with its greater or less 'probability.'

The doctrine of probabilism arose in the Middle Ages from the wide play given in penitential books to the idea of the morally indifferent, and was further promoted by the discussions of the scholastics upon conflict of authorities, and thus upon apparent or real conflict of duties, in the moral sphere. Vasquez introduced (1598) probabilism into the moral theology of the Jesuits, and it soon gained a large place, being developed with great subtlety. In its extremest developments probabilism held that it is lawful to act upon any opinion which has in its favor the authority of any grave and approved doctor, though it may be less probable than its opposite. Escobar taught that a confessor must absolve if a penitent appeals to a probable opinion, even if he himself holds another. In the sequel there was a very great relaxation of the whole moral tone, and serious scandals arose, leading to the condemnation of probabilism by the Sorbonne (1620). Against this theory, called probabilism simple, Pascal (q.v.) directed some of his famous *Provincial Letters* (1656). Discussion upon the subject was long continued, and in 1691 Gonzalez, the general of the Jesuits, issued his *Elements of Moral Theology*, which took the anti-probabilistic side, requiring that an opinion shall be certain before it is acted upon. Later sprang up three schools of probabilism, (1) that of *æqui-probabilism*, according to which, of two opinions one can be chosen only if it is at least equally probable with the other; (2) *probabiliorism*, according to which there are no cases of exactly equal probability, and the more probable is always to be followed; (3) *tutorism*, according to which the safer opinion is to be followed, even if less probable.

The great modern master on the subject is Saint Alfonso Liguori, whose system may be described as a kind of practical probabiliorism, in which, by the use of what are called reflex principles, an opinion which *objectively* is but probable is made *subjectively* the basis of a certain and safe practical judgment. There can be no doubt that the system of probabilism has been pushed by some individual divines to scandalous extremes; but it is only just to add that these extremes have been condemned by authority in the Roman Church; and that, on the other hand, the

principles of the higher Roman schools of probabilism are substantially the same as those of all moralists, whether of the old or of the new schools of ethics.

Consult: Döllinger-Reusch, *Geschichte der Moralstreitigkeiten in der römischen Kirche seit dem 16. Jahrhundert* (Nördlingen, 1889); Luthardt, *Geschichte der christlichen Ethik* (Leipzig, 1892).

PROBABILITY (Lat. *probabilitas*, from *probabilis*, probable). Expressions like the following are in common use: "It will probably rain to-day," "The chance of finding the article is very small," "He is more likely to succeed than to fail," "A is almost sure to be elected." These expressions all imply a lack of knowledge, an uncertainty as to the actual condition of affairs. But they signify different degrees of uncertainty. The first and third are indefinite, the second and fourth are quite definite. In order to answer in mathematical terms the question, "What is the chance of an event happening?" it is necessary to have some standard of measure or of comparison. Suppose we know only one of ten candidates on examination for a degree, and we hear that one passed. What is the chance or probability that our acquaintance is that one? If, according to our knowledge of the case, one candidate is as likely to pass as any other, we may say that the chance of our acquaintance having passed is 1 to 10. If, however, six of the candidates are men, and our acquaintance is a man, and we hear that it is a man who passed, the chance is now 1 to 6. But if we hear the name of the successful candidate, this name corresponding to that of our acquaintance, and observe that the names on the list are all different, the chance is now 1 to 1, or it is a *certainty*. Certainty is called the *unit of probability*. It is the standard which all estimate alike. All other degrees of probability will be expressed as fractions of certainty. E.g., in the above case of the candidate, on the first evidence the chance is 1:10, on the second evidence it is 1:6, on the third 1, or certainty.

If an event can occur in only one of a number of different ways, equally likely to occur, the probability of its happening at all is the sum of the several probabilities of its happening in the several ways. This proposition, the result of common experience, is generally accepted as axiomatic. Thus a coin can fall either head or tail, therefore the chance of its falling head is $\frac{1}{2}$, and of its falling tail is $\frac{1}{2}$, the sum of these chances being 1. This is as it should be, for the coin must certainly fall in order to produce head or tail. The probability of an event not happening is found by subtracting from unity the fraction representing the probability that it will happen. E.g., if the chance of an event happening is $\frac{2}{3}$, the chance of its not happening is $1 - \frac{2}{3} = \frac{1}{3}$. Or, if A's chance of hitting a target is $\frac{1}{3}$ and B's chance of hitting it is $\frac{1}{6}$, the chance of both missing it is $1 - (\frac{1}{3} + \frac{1}{6}) = \frac{1}{2}$. Two probabilities whose sum is unity are called *complementary probabilities*. E.g. the probability of drawing at one trial a white ball from a bag containing 2 white and 3 black balls is $\frac{2}{5}$. The probability of drawing a black ball is $\frac{3}{5}$. Their sum is 1, hence they are complementary probabilities. In general, if an event can happen in *a* ways and fail in *b* ways, all of which are equally likely to oc-

cur, the probability of its happening is defined to be $\frac{a}{a+b}$, and the probability of its failing is defined to be $\frac{b}{a+b}$, the two being complementary.

In this case, the odds in favor of the event are said to be a to b , and the odds against the event are said to be b to a . E.g. there are five ways of drawing one black ball from five black balls and three ways of drawing a white one from three white balls. Hence the probability of drawing a black ball from the whole eight on the first trial is $\frac{5}{8}$, and of not drawing a black ball, or, what is the same thing, of drawing a white one, is $\frac{3}{8}$. The odds in favor of drawing a black ball are 5 to 3. The odds against this are 3 to 5. Likewise, the odds in favor of drawing a white ball are 3 to 5, and the odds against it are 5 to 3.

If the probability of two independent events taking place are respectively $\frac{a}{(a+b)}$ and $\frac{a'}{(a'+b')}$, the probability that both will happen is $\frac{aa'}{(a+b)(a'+b')}$. The probability of both events failing is $\frac{bb'}{(a+b)(a'+b')}$. When *fail* is substituted for *happen*, bb' must be substituted for aa' . Similarly, the probability that the first event happens and the second event fails is $\frac{ab'}{(a+b)(a'+b')}$ and the probability that the first event fails and the second event happens is $\frac{a'b}{(a+b)(a'+b')}$. E.g., if p and p' are the respective probabilities that each of two events happens, then pp' is the probability that both happen. In like manner, if there of two events happens, then pp' is the probability that they will all happen is the product of their respective probabilities of happening.

If p represents the probability of the happening of an event in one trial and q the probability of its failing, the probability that it will happen exactly r times in n trials is

$$\frac{n(n-1) \dots (n-r+1)}{r!} p^r q^{n-r}.$$

The probability that an event will fail exactly r times in n trials is

$$\frac{n(n-1) \dots (n-r+1)}{r!} p^{n-r} q^r.$$

In the expansion of $(p+q)^n$, viz.

$$p^n + np^{n-1}q + \frac{n(n-1)}{2!} p^{n-2}q^2 + \dots,$$

the terms represent respectively the probabilities of the happening of the event exactly n times, $n-1$ times, $n-2$ times, and so on, in n trials. Hence the most probable number of successes and failures in n trials is given by the greatest term in the corresponding series. E.g. the probability of throwing an ace in one trial with a die is $\frac{1}{6}$ and of failing to do so is $\frac{5}{6}$. Also $(\frac{1}{6} + \frac{5}{6})^4 = \frac{1}{1296} + \frac{4}{216} + \frac{6}{216} + \frac{4}{216} + \frac{1}{1296}$, hence the probability of throwing an ace 4 times in 4 throws is $\frac{1}{1296}$, the probability of throwing an ace 3 times in 4 throws is $\frac{4}{216}$, the probability of throwing an ace 2 times in 4 throws is $\frac{6}{216}$, the probability of throwing an ace 1 time in 4 throws is $\frac{4}{216}$, the probability of throwing an ace no time in 4 throws is $\frac{1}{1296}$. Since the last fraction is the largest, the case of no ace in 4 throws of a die is more probable than that of 1, 2, 3, or 4 aces.

A problem in life insurance, a subject to which the theory of probability has been of indispensable service, will serve to show the applications of the subject. A table of mortality gives the numbers alive at each successive year of their age, out of a given number of children born. If A_n and A_{n+1} be the numbers in the table corresponding to the n th and $(n+1)$ th years of age; the inference from the table is, that of A_n individuals now alive, and of n years of age, A_{n+1} will live one additional year at least. Hence, the chance that any one of them die during the year is $\frac{A_n - A_{n+1}}{A_n}$. Calling this $1-p$, p is the chance

that any one of them will survive the year. Of two individuals, one n years old, and the other n' , what are the chances that (a) only one lives a year? (b) one, at least, lives a year? (c) both do not live a year? Calling the individuals A and B, the chance of A living out the year is p , and the chance of his dying within the year is $1-p$. For B these are p' and $1-p'$. Hence that A lives and B dies the chance is $p(1-p')$. That B lives and A dies the chance is $p'(1-p)$. Hence the answer to (a) is $p+p'-2pp'$. The second case includes, in addition to the conditions of (a), the chance that both survive, which is pp' . Hence the answer to (b) is $p+p'-pp'$. In the third case the chance that both live a year is pp' . Hence the chance that both will die is $1-pp'$.

The theory of probability also furnishes a measure of expectation. The law of expectation in its simplest form may be stated thus: The value of a contingent gain is the product of the sum to be gained into the chance of winning it. Suppose A, B, and C have made a pool, each subscribing \$1, and that a game of pure chance (i.e., not dependent on skill) is to be played by them for the \$3. What is the value of the expectation of each? By the conditions, all are equally likely to win the pool, hence its contingent value must be the same to each; and, obviously, the sum of these values must represent the whole amount in question. The worth of the expectation of each is therefore \$1. That is, if A wishes to retire from the game before it is played out, the fair price which B or C ought to pay him for his share is simply \$1. But this is obviously $\frac{1}{3}$ of \$3, i.e. the value of the pool multiplied by his chance of getting it.

Another very important application of the theory of probability is to the deduction of the *most probable* value from a number of observations, each of which is liable to certain accidental errors. In a set of such observations, the probable error is the quantity such that there is the same probability of the true error being greater or less than it, and this probable error has been shown to be least when the sum of the squares of the errors is a minimum. The method for obtaining this least error is called the method of least squares. See LEAST SQUARES, METHOD OF.

The doctrine of probabilities dates as far back as Fermat and Pascal (1654). Huygens (1657) gave the first scientific treatment of the subject, and Jakob Bernoulli's *Ars Conjectandi* (posthumous, 1713) and De Moivre's *Doctrine of Chances* (1718) raised the subject to the plane of a branch of mathematics. The theory of errors may be traced back to Cotes's *Opera Miscellanæ* (posthumous, 1722), but a memoir prepared by Simpson in 1755 (printed 1756) first applied the theory

to the discussion of errors of observation. Laplace (1774) made the first attempt to deduce a rule for the combination of observations from the principles of the theory of probabilities. He represented the law of probability of errors by a curve $y = \theta(x)$, x being any error and y its probability, and laid down three properties of this curve: (1) It is symmetric as to the Y-axis; (2) the X-axis is an asymptote, the probability of the error ∞ being 0; (3) the area enclosed is 1, it being certain that an error exists. He deduced also a formula for the mean of three observations. Among the contributors to the general theory of probabilities in the nineteenth century have been besides Laplace, Lacroix (1816), Littrow (1833), Quetelet (1853), Dedekind (1860), Helmert (1872), and Laurent (1873). On the geometric side the influence of Miller and *The Educational Times* has been marked. The literature of the subject is very extensive. Of the recent works, besides those already mentioned, the following are among the most important: Czuber, *Geometrische Wahrscheinlichkeiten und Mittelwerte* (Leipzig, 1884; French trans., Paris, 1902); Herz, *Wahrscheinlichkeits und Ausgleichungsrechnung* (Leipzig, 1900); Kries, *Die Principien der Wahrscheinlichkeits-Rechnung* (Freiburg, 1886); Poincaré, *Calcul des probabilités* (Paris, 1896); Whitworth, *Choice and Chance* (Cambridge, 3d ed., 1878). The following earlier works are also well known: Cournot, *Exposition de la théorie des chances et des probabilités* (Paris, 1843); De Morgan, *Essay on Probabilities* (London, 1838); Lacroix, *Traité élémentaire du calcul des probabilités* (Paris, 1833); Poisson, *Recherches sur la probabilité des jugements* (Paris, 1837). For the early history of the subject, consult Todhunter, *History of the Mathematical Theory of Probability* (Cambridge, 1865). For the later history and for a brief essay on the theory, consult Merriman and Woodward, *Higher Mathematics* (New York, 1896).

PROBATE COURT (Lat. *probatus*, p.p. of *probare*, to test, examine, from *probus*, good). A court whose original functions consist in the probate of wills and the administration of decedents' estates. In England it dates from the Court of Probate Act of 1857 (20-21 Vict., c.77), a statute which conferred upon this new tribunal all the powers and duties in probate matters, which the Prerogative Court of the Archbishop of Canterbury then had. By the Judication Act of 1873 (36-37 Vict., c.66) it became a part of the Supreme Court of Judication under the title of the Probate Division. Besides the judges of this division of the High Court of Justice, there are various registrars, record keepers, and minor officials assigned to the registry districts into which the kingdom is divided. Each district registrar has power to grant probate of wills or letters of administration, upon estates of persons having a fixed abode within the district at the time of death, provided no opposition is made thereto. In case of litigation, however, the proceedings for probate must be taken in the proper County Court, or in the Probate Division of the High Court.

In the United States, probate courts have been temporal tribunals from the first. This was inevitable, for there were no Church establishments in connection with which ecclesiastical courts could be organized after the English model. Hence the various colonies conferred the powers

of proving and registering wills, of granting letters of administration, and the like, upon some minor civil tribunal, such as the County Court in Massachusetts, or the Court of Burgomasters in New York, while that colony belonged to Holland, or the Court of Common Pleas after it passed under English rule. In many of the States at present probate tribunals are distinct courts, with original and extensive jurisdiction not only over the probate of wills and the administration of decedents' estates, but over the appointment of guardians to minor and other legally incompetent persons, over petitions for the adoption of children, and the change of names. In other States these functions are imposed by statute upon different local tribunals, such as district and county courts. Even in States of the former class, the tribunals are variously designated, as Courts of Probate, Surrogates' courts, Ordinary's courts, or Orphans' courts. They are always inferior courts from whose decisions appeals may be taken to higher tribunals. For their jurisdiction and powers, the statutes in each State must be consulted. See Nelson, *Handbook on Probate Practice* (London, 1901); Powles and Oakley, *Principles and Practice of the Court of Probate* (ib., 1892); Smith, *Practice and Proceedings in the Probate Courts* (Boston, 1894); Redfield, *Law and Practice of Surrogates' Courts in the State of New York* (New York, 1894).

PROBATION AFTER DEATH (Lat. *probatio*, from *probare*, to test, examine). A theological doctrine according to which man's future destiny is not unalterably fixed at death, but either all men or a certain class of men will be placed on trial in another life for a definite period or until they shall have yielded to God's redeeming love. In one form or another this doctrine has been held by many Jews and Christians since, under the influence of Persian and Greek thought, the idea of future punishment developed among them. (See HELL.) Some have thought of a fixed period extending from the death of the individual to the final judgment; others have made the period indefinite in length, depending upon the intensity of the soul's resistance to the grace of God. Some limit probation after death to such persons as have not had opportunity in this life of accepting Christ; others think that the same privilege will be extended to all men. Scriptural support for the doctrine has generally been sought in I. Peter iii. 19-20, iv. 6, in which a critical exegesis unquestionably is obliged to find the belief expressed that Jesus, after his death, went to Hades to proclaim the gospel to one class of the dead, viz. those who had been disobedient in the days of Noah. While the advocates of future probation have emphasized the necessity of actual knowledge of the life, teachings, death, and resurrection of Jesus, many defenders of the officially recognized system of eschatology have regarded such knowledge as of less importance than the moral and religious disposition that under favorable circumstances may find expression in a free and intelligent acceptance of Christ. A changed estimate of the value of the statements of Bible and creeds, and new methods of approach to the whole subject of man's future existence, have tended to remove from public discussion what once was a very burning question. Consult: Dorner, *System der christlichen Glaubenslehre*

(Berlin, 1879-81; Eng. trans., Edinburgh, 1880-84); *Dorner on the Future State*, translation of the eschatological section of the preceding work by Newman Smyth (New York, 1883). See ESCHATOLOGY; IMMORTALITY; JUDGMENT, FINAL; HEAVEN; HELL; UNIVERSALISM.

PROBLEM (OF. *probleme*, Fr. *problème*, from Lat. *problema*, from Gk. *πρόβλημα*, *problem*, from *προβάλλειν*, *proballain*, to place before, from *πρό*, *pro*, before + *βάλλειν*, *ballain*, to throw). In geometry, a proposition in which some operation or construction is required, e.g., the proposition "To construct an equilateral triangle" would be a problem.

PROBLEM OF THE THREE BODIES. An astronomical problem demanding the motion of three bodies attracting one another according to the law of gravitation. A complete solution of this problem has so far defied the mathematicians, although the general differential equations of the motion were given by Laplace. See CLAIRAUT.

PROBOSCIDEA (Neo-Lat., from Lat. *proboscis*, from Gk. *προβοσκis*, *proboskis*, *proboscis*, from *πρό*, *pro*, before + *βόσκειν*, *boskein*, to feed). An order of mammals embracing the elephants (q.v.), living and extinct. The nearest relatives of the Proboscidea are the extinct Toxodontia on one hand, and on the other the Hyracoidae. Consult Beddard, *Mammalia* (London, 1902).

PROBOS'CIS MONKEY, or NOSE-APE. A large, yellowish monkey with the head and long hair of the neck and shoulders chestnut. It is closely allied to the langurs, but is distinguished by having in the adult male a comically long nose, for which reason mainly it has been set apart in a separate genus, and given the name *Nasilis larvatus*. This monkey is a native of Borneo, where it goes about in large bands, the habits of which are little known. It seems to be merely an aberrant form of the genus *Semnopithecus*. See PLATE OF MONKEYS OF THE OLD WORLD.

PROBUS, MARCUS AURELIUS, Roman Emperor A.D. 276-282. He was born at Sirmium, in Pannonia. Probus early entered the army, and had the good fortune to attract the favorable notice of the Emperor, Valerian, who elevated him before the legal period to the rank of tribune. He distinguished himself against the Sarmatians on the Danube, and subsequently in Africa, Egypt, Asia, Germany, and Gaul, winning golden opinions from Valerian's successors, Gallienus, Claudius II., Aurelian, and Tacitus. By the last-named Emperor he was appointed governor of the whole of Rome's Asiatic possessions, and declared to be the chief mainstay of the Roman power; and such was the zealous attachment evinced for him by his soldiers, whose respect and love he had won equally by his firm discipline, by his care in providing for their wants and comforts, and by his liberality in the distribution of plunder, that, on the death of Tacitus, they forced him to assume the purple; and his rival, Florianus, having been removed, Probus was enthusiastically hailed Emperor by all classes (A.D. 276). His brief reign was signalized by brilliant and important successes; the Germans, who, since Aurelian's time, had made Gaul almost a part of Germany, were driven out with enormous slaughter, pursued into the heart of their

own country, compelled to restore their plunder, and to furnish a contingent to the Roman armies. Pursuing his victorious career, Probus swept the barbarians from the Rhatian, Pannonian, and Thracian frontiers, and forced Persia to agree to a humiliating peace. On his return to Rome, Probus celebrated his achievements by a triumph, and then, the external security of the Empire being established, devoted himself to the development of its internal resources. The senate was confirmed in its privileges; liberal encouragement was given to agriculture; numerous colonies of barbarians were established in thinly peopled spots, that they might adopt a civilized mode of life; and all branches of industry were protected and promoted. But Probus, as the Romans had now no enemies, employed the soldiers as laborers in executing various extensive and important works of public utility. Such occupations, considered as degrading by the soldiers, excited among them the utmost irritation and discontent, and a body of troops murdered him October, A.D. 282.

PROBUS, MARCUS VALERIUS. A Roman critic and grammarian, born at Berytus, in Syria, in the second half of the first century A.D. He devoted his attention chiefly to the archaic and classic literature of Rome, and made annotated editions of Horace, Vergil, Lucretius, Terence, and Persius, after the manner of the Alexandrian scholars. His biography of Persius is extant, but the commentary to Vergil's *Eclogues* and *Georgics*, and several grammatical treatises bearing his name, are probably the works of a grammarian of the fourth century. Probus is usually ranked among the greatest Roman philologists. Consult: Teuffel and Schwabe, *Geschichte der römischen Litteratur* (5th ed., Leipzig, 1890); and Steub, *De Probis Grammaticis* (Jena, 1871).

PROCEDURE (OF. *proccedure*, Fr. *procédure*, from Lat. *procedere*, to go forward, from *pro*, before, for + *cedere*, to go). In law, the successive steps or proceedings in the initiation and conduct of a judicial proceeding, and the rules of law governing them. In its broadest sense the term includes evidence and pleading. In a narrower sense the term is used as synonymous with practice, which embraces the rules governing the form and manner of conducting the various steps in a legal proceeding other than the rules of evidence (q.v.) and the rules of pleading (q.v.).

The judicial proceeding may be directed toward the person, when it is said to be *in personam*; or it may be directed toward the property, when it is said to be *in rem*. See IN PERSONAM; IN REM; LAW.

In English jurisprudence three distinct systems of procedure corresponding and adapted to distinct systems of jurisprudence were developed respectively by the courts of common law, the courts of chancery, and the courts of admiralty. While necessarily having many elements in common, these systems for the most part differ widely from each other and their characteristics can be best understood by treating each separately.

COMMON-LAW PROCEDURE. The common-law procedure is much older than the procedure in either equity or admiralty as practiced by the English courts, the *curia regis* which was the forerunner of the English courts of Exchequer, Common Pleas, and King's Bench, in which the common-law procedure was developed, having

been established during the reign of Henry I. (1100-1135). The common-law procedure was early marked by extreme formality, and ultimately it became necessary to simplify the system by means of legislation, which has given to us the various forms of reformed common-law procedure in modern use and in many States of the United States. See CODE; LAW; EQUITY.

The first step in an action at common law was the issuing of the original writ on application of the plaintiff, which commanded the sheriff to summon the defendant to give to the plaintiff the relief demanded by him or to appear before the next term of court and show cause why such relief should not be granted. The effect of the original writ was twofold. It gave the court jurisdiction over the subject matter by authorizing it to proceed with all subsequent steps in the litigation. It also gave the court jurisdiction over the person of the defendant when the sheriff had executed the writ by serving it personally upon him. It could then issue its process or mandate compelling the attendance of the parties and witnesses, direct the filing of pleadings, summon and impanel a jury, and after trial and verdict enter judgment for the successful party and issue its execution or other mandate to the sheriff for the purpose of satisfying the judgment. Historically the original writ is also important, as from it the action took its form, since the plaintiff's pleading was required to conform to the allegations and demand for relief contained in the original writ. See FORMS OF ACTION.

The original writ having been issued and served upon the defendant, it then became his duty to appear in the proceeding and plead, and if necessary the court could compel his appearance by issuance of its process (q.v.) known as a judicial writ as distinguished from the original writ. The method of pleading and of trying the issues raised by the pleadings is fully considered under such titles as PLEADING; EVIDENCE; TRIAL; JURY; etc., to which reference should be made in connection with this subject.

During the course of the proceeding and after verdict, the parties to the action might apply to the court for various forms of relief incidental to the proper conduct of the proceeding. Thus upon application the court might use the subpoena to command the attendance of witnesses, and punish for contempt; and after verdict the unsuccessful party might make motions for a direction of the court in effect reversing or setting aside the verdict of the jury. Thus the unsuccessful party might move: (a) for a new trial on the ground that the judge had not properly instructed the jury or that he had admitted or excluded evidence contrary to law or because of newly discovered evidence; or (b) he might move in arrest of judgment on the ground that some error on the face of the record vitiated all the proceedings; or (c) if the verdict was for the defendant, the plaintiff might move for judgment *non obstante verdicto*—without regard to the verdict—on the ground that he was entitled to judgment on the face of the pleadings; or (d) for a repleader, i.e. allowing the parties to plead anew because they had framed issues upon some immaterial matter; or (e) for a *venire facias de novo*, that is, a judicial writ summoning a new jury because the jury at the trial in the action was guilty of some misconduct invalidating its verdict.

Upon denial of these motions judgment was then entered by the court, usually by signing of the judgment by a proper officer of the court, for the plaintiff (*quod recuperet*) or for the defendant (*nil capiat*) in accordance with the verdict. The successful party was then entitled to enforce the judgment by the writ of execution. (See EXECUTION; JUDGMENT; ATTACHMENT; ARREST; DEBTOR; etc.) If, however, the unsuccessful party deemed the judgment erroneous in law, he was at liberty to remove the entire record of the case to a higher court for review upon suing out a writ of error, which, like the original writ, was issued out of Chancery. See ERROR, WRIT OF.

Such in its barest outline was the method of procedure developed by the common-law courts. The material elements of the system, except possibly those of the system of pleading, remain unchanged, although there has been great modification of the minor details, chiefly in the direction of greater simplicity. The first of these changes was in the use of the original writ. By the use of a series of fictions the common-law courts came ultimately to dispense with the original writ as a means of acquiring jurisdiction, and the action was regularly begun by the issuance by the courts of law of their judicial process, the summons directly, instead of the original writ. In each of the United States there are now courts established by statute having general jurisdiction over actions and authorized to acquire jurisdiction over the person of litigants upon service of its summons or writ. The summons is still issued in the name of the court, but usually attorneys as officers of the court are authorized to issue the summons directly without application to the court. This is true also of many other forms of process, as, for example, subpoenas to appear and testify, and the writ of execution.

The various changes in the system of pleading, which are more substantial than any which have taken place in procedure proper, have been noted under that title, but the system of pleading has been indirectly modified by changes in procedure. Thus the remedy for formal defects, which was formerly by demurrer, is now by statute generally a motion to strike out immaterial matter or to make the pleading more definite and certain. A party may be required to define and limit the scope of his pleading by a motion for an order directing him to give a bill of particulars (q.v.) of his claim. There are also various forms of relief incidental to the proceeding which have been created anew or adopted from the equity practice by statute; as, for example, the examination of witnesses before trial or by commission, the practice of referring some part or all of the controversy to a referee having substantially the power of court, and the granting of various provisional remedies, such as attachment and arrest. The extent to which execution against the person requiring the arrest of a defendant for non-payment of a judgment may be used has been much limited by modern statute, but in many States the plaintiff is given a statutory right to examine the judgment debtor as to his resources and give an appropriate remedy by receiver or otherwise by which the application of moneys due to the judgment debtors to payment of the judgment may be compelled. The practice on appeal has also been simplified, mere notice of the appeal served upon the appellant's opponent being

all that is generally required to perfect the appeal.

Common-law courts also exercised jurisdiction *in personam* by what were known as the extraordinary writs—certiorari (q.v.), habeas corpus (q.v.), quo warranto (q.v.), and mandamus (q.v.).

For the procedure in criminal actions, see PROSECUTOR; PROSECUTION; INDICTMENT; JURY; GRAND JURY; PUNISHMENT, etc.

EQUITY PROCEDURE. Procedure in equity is much simpler than the procedure at common law. Its essential characteristics are based on the fact that the jurisdiction of equity is *in personam* and that the sole power of that court is to command things to be done, and not directly to transfer or otherwise affect the rights of litigants. The first step in a proceeding in equity was to file in the office of the clerk of the court the bill which is the plaintiff's first pleading. Inasmuch as a court of equity acts *in personam* only, it can deal adequately with a many-sided controversy. There was consequently no limit to the number of parties to the proceeding, whose interests might be as diverse as their number, provided they were all interested in the controversy, and they might be brought into the proceeding by a proper bill. Upon service of the subpoena, the plaintiff then became entitled to an answer, failing which he was entitled upon the default of the defendant to the relief asked by the bill, or he could apply to have an attachment issued compelling the defendant to answer. Upon a determination of the questions raised by the pleadings and at the trial, the court might then make its decree adjusting the rights of all parties and commanding them to carry out its directions. If a party refused to obey the decree or order and was willing to accept the punishment for contempt, the court of equity was powerless to execute its decrees; but in modern practice this contingency is avoided by statutes authorizing the court to appoint an officer of the court to do the act required by the decree to be performed by a party and with the same legal effect. See PLEADING; TRIAL; EQUITY.

At any stage of the proceeding, or even before service of process, the court may grant interlocutory or intermediate relief to prevent injury to the parties or the subject of the suit pending the litigation. This is usually in the form of an injunction (q.v.) or the appointment of a receiver (q.v.).

Equity procedure, when it has been maintained as a distinct system, as in the United States courts and in a few States, notably New Jersey, has undergone no substantial change; and when modification has been adopted, it has been usually accomplished by rules of court.

ADMIRALTY PROCEDURE. Procedure in admiralty was founded upon the civil law and corresponds in many particulars to the equity system. It was much more simple and expeditious than the procedure of the common-law courts. It was adapted to proceedings either *in rem* or *in personam*, and, indeed, both forms of remedy might be sought and obtained in a single proceeding.

The first step in an admiralty proceeding was the filing of the libel, which, like the bill in equity, was both the plaintiff's or libellant's first pleading and a petition to the admiralty court to issue its writ or process, which was executed by

an officer of the court by personally serving it upon the respondent in case the proceeding was *in personam*, or by taking possession of the property in case the proceeding was *in rem*. As in equity practice, the libellant might compel the defendant to give discovery (see PLEADING), by annexing interrogatories to his libel. If the respondent failed to appear the libel was taken *pro confesso* upon the default, and an appropriate decree was rendered. Upon the appearance of the respondent, he might either except to the libel or file his answer. The exception might be peremptory, when it was in substance like a demurrer to the substance of the libel; or it might be dilatory, when it was in effect like a demurrer to the form of the libel or a motion to strike out irrelevant or scandalous matter. The effect of the peremptory exception, if sustained, was the dismissal of the bill; otherwise the respondent was required to answer. In the case of dilatory exception, if sustained, the libellant was required to correct his libel by amendment so that it was formally correct, otherwise the respondent was required to answer. The answer might set up any matter of defense or an independent claim against the libellant, when the answer was called a cross libel. No attempt was made to reduce the matter in dispute to a single issue as in the pleadings at common law. As in equity, all evidence was usually taken before a commissioner or corresponding officer of the court and then submitted to the court; and, as in equity, the judgment of the court might be embodied in an interlocutory decree followed by a final decree.

Incidental relief might be granted during the progress of the litigation upon petition, if the application was *ex parte*, or by motion, when notice was given to the other litigants. Thus the court might authorize the sale of perishable goods and the appropriation of the proceeds as directed by the final decree, or it might authorize the return of property from the litigation upon the filing of a proper bond.

Admiralty procedure has undergone but slight modification; and that, as in equity, has been effected for the most part by rules of court.

CODES OF PROCEDURE. The embarrassment experienced as a consequence of the technical character of the common-law procedure led to various attempts at reform by legislation. The earliest of these was directed toward a simplification of the system of pleading, and has been referred to under that title. In 1848 the Legislature of New York adopted a civil code which was intended to be a complete codification of procedure both in law and equity. The New York code served as a model for similar legislation in many other States, while most of the remaining States, though nominally not code States, have so far revised their systems of procedure as to have systems substantially like the codes of procedure. Owing to the inherent difficulties in acceptably codifying a system so complex as the law of procedure, the codes have required frequent amendment and revision, despite which they are still found to have perpetuated many of the faults of the common-law system.

The following are some of the more important changes effected both by the codes and the various statutes enacted for the purpose of reforming procedure. All formal distinctions between the procedure at law and in equity have been abolished, and while the methods of trial in the one

case by a jury and in the other by the court have been preserved, the same court sits both as a court of law and a court of equity. Interlocutory or provisional remedies have been created by which in certain cases the plaintiff is enabled to procure a preliminary writ of attachment directed against the property or person of the defendant pending the litigation. Provision is also made for various motions to correct or amend the pleadings and for examination of witnesses and parties before trial; and the law relating to injunction and receivers is frequently regulated wholly by statute. Various provisions are also made to aid in the enforcement of judgments, usually by way of supplementary proceedings for examination of the judgment debtor and the appointment of receivers to collect sums due to him and apply them in satisfaction of the judgment.

As already suggested, most of the States have adopted codes of procedure or a reformed procedure substantially like the codes in which the law and equity system have been amalgamated and simplified as far as practicable.

Consult: Martin, *Civil Procedure at Common Law* (1899); Clark, *Science of Law and Law Making*; Daniell, *Pleading and Practice of the High Court of Chancery* (6th. Amer. ed., Boston, 1894); Shiras, *Equity Practice in the United States Circuit Courts* (2d ed., 1898); Henry, *Admiralty Jurisdiction and Procedure* (1885); Bishop, *The Law of Criminal Procedure* (4th ed., Boston, 1895); Elliot, *Criminal Procedure in England and Scotland* (London, 1878); Elliott, *Appellate Procedure* (1892); and the works referred to under such titles as COMMON LAW; EQUITY; CODE; ADMIRALTY; PLEADING; etc.

PROCESS (OF, *proces*, Fr. *procès*, from Lat. *processus*, a going forward, from *procedere*, to go forward). In law, a comprehensive term, including all mandates of a court, in either civil or criminal actions or proceedings, whether directed to an officer thereof, or to an individual. The term is also sometimes rather loosely employed to designate all the proceedings in an action or legal proceeding, and it is in this sense that it is used in the familiar phrase 'due process of law.' However, the word 'procedure' is a much better term for that purpose, as it includes many steps in an action which could not strictly be termed process, as, for example, the argument of a case. Process is usually issued in the name and under the seal of a court by an officer thereof, but in some States, where code practice prevails, certain processes, such as civil summons and subpoenas, may be issued in the name of the proper court, by an attorney in his capacity as an officer of the court. Under the common-law practice, 'original process' was the original writ by which the action was commenced, and 'mesne process' (q.v.) was that which was issued afterwards and during the progress of the action. Disobedience of process is contempt (q.v.) of court. See ACTION; PROCEDURE; SUMMONS; SUBPOENA.

In patent law, a process is a mode or manner of accomplishing a particular result by the application or combination of elements or natural forces. See PATENT LAW.

PROCESSIONAL (ML. *processionale*, from Lat. *processio*, procession, from *procedere*, to go forward). The service-book which contains the

prayers, hymns, and general ceremonial of the different processions in the Roman Catholic Church. The processional approved for common use is that of Rome, of which many editions have been published.

PROCESSION OF THE HOLY GHOST. A theological term used to describe the origin or proceeding of the third person of the blessed Trinity. In the early Church, controversies were concerned chiefly with the second person, and the question as to the origin of the Holy Spirit was not raised. In the form of the Niceno-Constantinopolitan creed used by the Greek Church it is said simply that the Holy Ghost "proceedeth from the Father." This was understood in the Latin Church to mean that, as the Son proceeds from the Father, so the Holy Ghost proceeds from both the Father and Son, and in the course of time the words "and from the Son" (*filioque*) were added in the churches of the West. The question has always been one of the chief contentions between the Latin and Greek churches. See FILIOQUE; GREEK CHURCH; REUNION OF CHRISTENDOM.

PROCH, *prôg*, HEINRICH (1809-78). An Austrian composer, born at Böhmisoh-Leipa. While studying law, he took lessons in music and on the violin, and finally gave up law for music. In 1837 he became kapellmeister at the Josephstädter Theater, and three years later was appointed to the Court opera, from which post he retired in 1870. In 1844 he produced a three-act opera, *Ring und Maske*, which was followed by several others. His song compositions, however, were more popular. Notable examples are *Von der Alpe tönt das Horn*, and *Ein Wanderbursch mit dem Stab in der Hand*. He was also highly regarded as a conductor.

PROCHEIN AMI, *prô-shân' à-mé'*. The old Norman-French law phrase for next friend. See NEXT FRIEND.

PROCIDA, *prô'chè-dá*. A small island off the west coast of Italy, situated between the island of Ischia and the mainland, north of the entrance to the Bay of Naples (Map: Italy, H 7). It is about a mile wide and 2 miles long, and of volcanic origin, but low and flat. Two semicircular bays on the south coast are the remains of submerged craters. The island is fertile and populous, having in 1901 a population of 13,964, engaged in vine and fruit culture and tunny fishery. The town of Procida on the east coast lies at the foot of a precipitous rock crowned by a castle. Its population is 3700.

PROCIDA, JOHN OF. A tragedy by James Sheridan Knowles (1840) founded on the history of an Italian physician, who in the Sicilian Vespers lost his only son, Fernando, and finally received the crown.

PROCLAMATION OF EMANCIPATION. See EMANCIPATION, PROCLAMATION OF.

PROCLUS (Lat., from Gk. Πρόκλος, *Proklos*) (A.D. 410-485). The last important teacher among the Greek Neo-Platonists. He was born at Constantinople, brought up at Xanthus in Lycia, and first trained in philosophy at Alexandria by the Aristotelian Olympiodorus. In Athens he was a disciple of the Neo-Platonists Plutarch and Syrianus, and about 450 he succeeded the latter in the chair of philosophy. Hence he received the name Diadochos, the 'Suc-

cessor.' Among his contemporaries he is said to have had the greatest influence because of his learning and piety. He is sometimes known as 'the Scholastic among Greek philosophers,' because of his having labored to collate, arrange, and reduce to a rigidly scientific system the mass of older philosophy which had come down to him. His teaching was a development of that of his master, Plotinus, but is still more mystical and difficult to understand, combining the most transcendental speculation with the common superstitions of his age. Certain features remind us strongly of Gnosticism, and his teaching on evil seems to have been the source of the doctrine of Dionysius Areopagita. He taught, like his predecessors, a primordial essence, an ineffable unity, from which, unlike Plotinus and Iamblichus, he believed a plurality of other unities to proceed. These returned to their source and issued again in an unending cycle of emanations, but each time with a less perfect result, so that the tendency of his philosophy was ultimately pessimistic. Among his works, of which there is as yet no complete edition, the most important are his commentaries to certain of Plato's dialogues and also his work on *Platonic Theology*. His *Philosophical and Theological Institutions* in 211 chapters is a compendium of the principles of Neo-Platonism. Important are his treatises on *Providence and Fate, Doubts About Providence, the Nature of Evil*, etc. His work in eighteen books against the Christians, mentioned by Suidas, has now been lost. He also produced certain encyclopædic works, including a commentary on Hesiod, Euclid, and Ptolemy, and a book *On the Sphere*. Certain hymns have also been preserved. Some of these writings are known to us only in translation. Among the partial editions of his works may be named: *Procli Opera*, edited by Cousin (6 vols., Paris, 1820-27; 2d ed. 1864); a commentary on Plato's *Parmenides*, ed. Stallbaum (Leipzig, 1839, 1848); on Plato's *Timæus*, ed. Schneider (Breslau, 1847); on Plato's *Republic*, ed. Schöll (Berlin, 1886); ed. Kroll (2 vols., Leipzig, 1899-1901). There are English translations of the *Philosophical and Mathematical Commentaries by Taylor* (2 vols., London, 1792); the *Platonic Theology*, and minor philosophical and theological treatises by the same (2 vols., London, 1816); and of the *Commentary on the Timæus* (2 vols., London, 1820). See Zeller, *Philosophie der Griechen* (3d ed., Leipzig, 1881).

PROCNE, prók'nè (Lat., from Gk. Πρόκνη, *Proknè*). In Greek legend, the wife of Tereus and the sister of Philomela (q.v.).

PROCONSUL (Lat., deputy consul). Originally a Roman magistrate not holding the consulship, who was invested with powers nearly approaching those of a consul, not, however, including Rome and its immediate vicinity. In early times the proconsul was an ex-consul who, on completing his term of office, received a continuation of the *imperium* in order to enable him to bring an unfinished campaign to a close. The duration of the office was one year. In the later period, when conquests had added foreign provinces to the Roman rule, the consuls, on giving up their position, received, as proconsuls, either the conduct of a war or the administration of a province. Occasionally the office of proconsul, with the government of a province, was conferred

on a person who had never held the consulship. In the reorganization of the Roman Empire, the administration of the provinces was divided between the Emperor and the senate, and the title proconsul was confined to the governors of senatorial provinces. Under Constantine parts of certain dioceses came to be governed by proconsuls.

PROCOPE, pró'kóp', CAFÉ. The first and most famous of Parisian cafés, situated opposite the Comédie Française when that theatre was opened in 1689, and still existing. Among its frequenters were Voltaire, Rousseau, Robespierre, Gambetta, and other famous men. A journal *Lo Procope*, published by the proprietor of the café, was founded in the seventeenth century to record the history of the café and its frequenters.

PROCOPIUS (Lat., from Gk. Προκόπιος, *Prokopios*). An eminent Byzantine historian. He was born at Caesarea, in Palestine, about the beginning of the sixth century, went to Constantinople when still a young man, and acquired there so high a reputation as a professor of rhetoric that Belisarius, in 527, appointed him his private secretary. Procopius accompanied the great warrior in all his important campaigns in Asia, Africa, and Italy, and appears to have displayed remarkable practical as well as literary talent, for we find him placed at the head both of the commissariat department and of the Byzantine navy. He returned to Constantinople shortly before 542, was highly honored by Justinian, and appointed prefect of the metropolis in 562. His death occurred, it is thought, about three years later. Procopius's principal works (all in Greek) are his *Historiæ*, in eight books (two on the Persian wars from 408 to 553; two on the wars with the Vandals, from 395 to 545; four on the Gothic wars, going down to 553); *Ctismata*, or six books on the buildings executed or restored by Justinian; and *Anecdota*, or *Historia Arcana* (which some have been unwilling to attribute to Procopius), a sort of *chronique scandaleuse* of the Court of Justinian. The most valuable of these productions is the first. Procopius is the principal authority for the reign of Justinian. His style is pure, vigorous, and flexible. The best edition of his complete works is that by Dindorf (3 vols., Bonn, 1833-38). There is an early English translation of the *Historiæ* by Holcroft (London, 1653). The section on the Gothic wars has been edited with an Italian translation by Comparetti (3 vols., Rome, 1895-98).

PROCOPIUS, ANDREW (c.1380-1434). A Hussite leader, known as Procopius the Great. He is also sometimes called the Holy, or the Shaven, in allusion to his having received the tonsure in early life. He studied in Prague, and after traveling for several years in foreign countries he returned to Bohemia and entered the ranks of the insurgent Hussites. His military genius soon raised him to the rank of an influential commander; and on the death of Ziska (q.v.), in 1424, Procopius was elected by the Taborites, who formed the radical section of the Hussites, as their leader. In the ensuing years he ravaged Austria, but in 1426 he vanquished the crusading armies of Central Germany at Aussig. In the meantime another body of Taborites, who called themselves Orphans, had overrun Lusatia, and burned Lauban, under the leadership of Procopius the Lesser, or Younger, who now, in

concert with the more distinguished Procopius, attacked Silesia, and took part in those internal feuds of the Hussite factions by which Bohemia was almost wholly ruined. From 1428 to 1430 Procopius directed raids against Hungary, Silesia, Saxony, Franconia, and other neighboring lands, which were successful and caused the Hussites to be dreaded. The Emperor Sigismund attempted to treat with him, but was unsuccessful, and in 1431 Procopius decisively defeated a German army at Tauss. In 1433 the moderate Hussites or Calixtines accepted the terms offered by the Catholic party. The Taborites and Orphans, under the leadership of Procopius the Great and Procopius the Lesser, refused, however, to have anything to do with the Pope, and hence dissensions arose between them and the more moderate of the Hussites. After many lesser encounters between these factions, a decisive battle was fought near Böhmissch-Brod, on May 30, 1434, in which both Procopius the Great and Procopius the Lesser were slain. Consult Creighton, *History of the Papacy* (6 vols., London, 1897). See HUSSITES.

PROCRUSTES, *prō-krūs'tēz* (Lat., from Gk. *Προκρούστης*, *Prokroustēs*, from *προκρούειν*, *prokrouein*, to beat out, stretch). The surname of a celebrated robber of Attica, named Damastes, or Polypemon. According to the ancient legend, he had two beds, one short, the other long. If a short traveler came to him, he placed him on the long bed and hammered him out to fit; tall visitors he placed on the short bed and cut down to the proper length. Other writers speak of but one bed. On his journey from Troezen to Attica Theseus killed Procrustes in the same way he had slain his victims.

PROCTER, ADELAIDE ANNE (1825-64). An English poet, the eldest daughter of Bryan Waller Procter. She was born in London. In 1853 she became a contributor of verses to *Household Words*, under the *nom de plume* of Mary Berwick, and attracted the attention of Charles Dickens, who did much in the way of introducing her contributions to the public. All excepting four of her poems were first published either in *Household Words* or *All the Year Round*. In 1858 her collected poems were published in two volumes under the title of *Legends and Lyrics, a Book of Verse*. A number of editions were subsequently published, new verses being supplied to several of them, and for the edition of 1866, the tenth, Charles Dickens supplied a memoir. Her verses are distinguished by their tender sympathy and ardent feeling.

PROCTER, BRYAN WALLER (1787-1874). An English poet, better known as BARRY CORNWALL. He was born at Leeds and was educated at Harrow, where he met Peel and Byron. He studied law with a solicitor at Calne, in Wiltshire, and settled in London, where he was admitted to the bar and practiced as conveyancer. Shortly after the death of his father (1816) Procter joined the circle of Leigh Hunt and Charles Lamb and married (1824) a stepdaughter of Basil Montagu. He was commissioner in lunacy from 1832 to 1861. Procter's principal publications were: *Dramatic Scenes and Other Poems*, prompted by Lamb (1819); *Marcian Colonna and Other Poems* (1820), *A Sicilian Story and Other Poems*, both inspired by Hunt (1820); *Mirandola*, a tragedy (1821), performed by Kemble at

Covent Garden; *The Flood of Thessaly* (1823), also inspired by Hunt; and *English Songs* (1832). To the last half of his life belongs his delightful *Charles Lamb*, a memoir (1866-68). His *Essays and Tales in Prose*, originally contributed to annuals, were collected in 1853. Procter wrote nearly three hundred songs on a wide range of theme. It may fairly be said that he restored to the English lyric its melody, such as it had among the Elizabethans. Well known are "The Sea," "A Petition to Time," "Life," "Song to his Wife," "A Lost Chord," and many others. Consult Patmore, *Life of B. W. Procter*, containing the fragment of an autobiography (London, 1877).

PROCTOR (abbreviated from OF. *procurator*, from Lat. *procurator*, manager, from *procurare*, to manage, from *pro*, before, for + *curare*, to care, from *cura*, care). In its legal sense, originally one of the body of men who had the exclusive privilege of appearing in the ecclesiastical and admiralty courts of England; now, any attorney who practices in either of these courts or in a probate court. The former proctors were admitted to practice only by a commission issued in the name of the Archbishop of Canterbury. A proctor might have an advocate do the actual pleading or trial work for him, but he alone could bring and conduct the proceedings in his own name.

On the transfer of the jurisdiction of the ecclesiastical courts over the probate of wills, the administration of estates, and matrimonial causes, to the probate and divorce divisions, the proctors practicing in the former courts were empowered to appear in all the courts of equity and common law in England. In 1877 the Solicitors Act provided that all solicitors should have power to practice as proctors on their admission without further examination. Upon the abolition of the old judicial system of England by the Judicature Acts (q.v.), the authority to practice in both the new courts was given to both proctors and solicitors. Therefore, in England to-day, the old legal distinction between proctors and other members of the bar has been abolished.

However, in both England and the United States the title proctor is still applied to practitioners in the surrogate, probate, and admiralty courts, merely as a matter of description, and without any special legal signification. See ATTORNEY; SOLICITOR; LAWYER.

By other uses of the term in England, it is applied to the representatives of the parochial clergy in convocation (q.v.), and to the officers charged with the maintenance of discipline among undergraduates in the universities of Oxford and Cambridge.

PROCTOR, REDFIELD (1831—). An American political leader and Cabinet officer. He was born in Proctorsville, Vt., and graduated at Dartmouth College in 1851, and from the Albany Law School in 1859. He served throughout the Civil War, rising from a lieutenantancy in the Third Vermont Volunteer Infantry to be colonel of the Fifteenth Vermont. After some practice of law, he devoted himself to his extensive quarry interests, in which he accumulated a large fortune. After several terms in the State Legislature he served from 1876 to 1878 as Lieutenant-Governor, and from 1878 to 1880 as Governor.

In 1889 he entered the Cabinet of President Harrison as Secretary of War, resigning in 1891 to accept an appointment as United States Senator. He was elected for a full term of six years in 1893, and was reelected in 1899. Early in 1898 he visited Cuba to inform himself as to conditions in the island, and on the information obtained by him, especially regarding Weyler's reconcentrado system, the McKinley Administration's decision to adopt a policy of intervention is said to have been largely based.

PROCTOR, RICHARD ANTHONY (1837-88). An English astronomer, born in Chelsea. He was educated at King's College, London, and at Cambridge. He devoted himself for some time to literary pursuits and wrote articles for the *Popular Science Review* and other magazines. He edited the *Proceedings of the Royal Astronomical Society* in 1872-73; constructed star charts and made researches into the transits of Venus in 1874. He visited America and lectured in 1873-74, 1875-76, 1881, and 1884, when he settled in Missouri. He removed to Florida in 1887, but was summoned on business to England in 1888. He died in New York on his way to England. He was one of the greatest popularizers of science. Among his works are *Saturn and His System* (1865); *Half Hours with the Telescope* (1868); *Other Worlds than Ours* (1870); *Transits of Venus* (1874); *A Treatise on the Cycloid*, etc. (1878); *The Romance of Astronomy* (1880); *Hereditary Traits* (1882); *The Great Pyramid* (1883); *Nature Studies* (1883).

PROCLUIANS. A school or sect of Roman jurists during the first two centuries of the Christian Era. Its origin was ascribed to Labeo, the most distinguished jurist of the Augustan age and head of one of the Roman law-schools, as the origin of the rival Sabinian sect was ascribed to Capito, head of another law-school. Each sect, however, took its name from a successor of its founder: the Procluians from Proculus, who was head, after the elder Nerva, of the law-school established by Labeo. Among the noted Procluians were the younger Nerva and Pegasus in the first century, the younger Celsus and Neratius in the second. Pomponius declares that Labeo was inclined to introduce innovations, while Capito was more conservative; but there is no evidence, in the recorded differences of opinion between the schools in the second century, of any such permanent line of division. See CIVIL LAW and SABINIANS; and for literature, consult Muirhead, *Historical Introduction to the Private Law of Rome* (2d ed., Edinburgh, 1899).

PROCURATOR-FISCAL. In Scotland, a public prosecutor, corresponding somewhat to the district or prosecuting attorneys in the United States.

PRODUCE EXCHANGE. See EXCHANGE.

PRODUCTION (Lat. *productio*, a lengthening, from *producere*, to lead forth, from *pro*, before, for + *ducere*, to lead). One of the divisions of political economy devoted mainly to the consideration of the factors which affect the amount of wealth produced. From the standpoint of production the measure of economic efficiency is the extent of the product. Human progress is measured, in the words of Carey, "by man's control over nature." The greater this control, the

larger the volume of products available for man's use, the higher is the scale of development. Political economy starts with the thesis that natural forces (land), human energy (labor), and accumulated wealth (capital) are united in production. The economics of production looks to the maximum result from this conjunction of forces. As land is not reproducible, progress is measured by the degree of utilization of natural forces for human ends. Labor in like manner in relation to production fulfills its function most effectively when it is most fully employed and when it is most efficient. From this standpoint such developments as extend the field of employment and all measures which promote the productive efficiency of the individual laborer and improve the organization of labor are steps in progress. Since capital becomes more efficient as it grows in volume, economics, from the standpoint of production, looks to the development of capital, and in particular is concerned with all that promotes saving the accumulation of capital for future use.

For a long time the ideas here set forth dominated the treatment of political economy. Consciously or unconsciously, its devotees felt that human welfare was bound up with the multiplication of products. Of late years a reaction has set in, the interest in economics as represented in later writers having shifted from the question of how to produce the largest quantity of goods to that of how under our present social organization these goods are to be distributed in the form of rent, interest, profits, and wages to those who share in the production of the goods. See CONSUMPTION; DISTRIBUTION; EXCHANGE; POLITICAL ECONOMY.

PRODUCTUS (Lat. *productus*, prolonged, led forward, p.p. of *producere*, to lead forward, produce). An important genus of fossil brachiopods found in Upper Devonian and especially in Carboniferous rocks. The shells are usually semi-circular in outline, with straight hinge-line, concave or flat dorsal and very convex ventral valve, both of which are often much produced anteriorly. The beak of the dorsal valve is depressed, while that of the ventral valve is very prominent and often projects far behind the hinge-line. The outer surface has radial or concentric wrinkles and the ventral valve has generally a number of long curved hollow spines by which the shell was anchored to the muddy or sandy bottom. The genus *Productus* is a well-known index fossil of the Carboniferous system. *Productus semireticulatus* of the Subcarboniferous limestone has been found in almost all parts of the world; it is perhaps the most widely distributed fossil mollusk known. Another species, *Productus horridus*, is characteristic of the coal measures. *Productus giganteus*, with a width of six to ten inches, is the largest brachiopod known. A number of allied genera of interest are: *Productella*, the Devonian ancestor of *Productus*, a less degenerate type with cardinal area and teeth; *Proboscidella*, a Carboniferous phylogerontic type in which the anterior portion of the ventral valve is much produced to form a sort of siphonal tube; *Strophalosia*, a degenerate type, found in the Devonian and Carboniferous, which by cementation of its ventral valve to foreign objects has lost its symmetry of form. Consult Hall and Clarke, "Introduction to the Study of the Genera of Palaeozoic

Brachiopoda." in *Palaeontology of New York*, vol. viii., part 1 (Albany, 1892).

PRO ECCLESIA ET PONTIFICE, prō ēk-klē'shi-ā ēt pōn-tif'i-sē (Lat., For Church and Pope). A Papal order instituted in 1888 by Pope Leo XIII. on the occasion of the jubilee commemorating the fiftieth anniversary of his entrance into the priesthood. The silver cross of the order bears the Papal arms surrounded by the motto *Pro Ecclesia et Pontifice*, with the date of foundation on the arms of the cross. On the reverse is a bust of Leo XIII. with comets on the arms of the cross. The order was founded originally for the donors and pilgrims to the jubilee, but is conferred in recognition of devotion to the Papacy.

PRÆTUS, prœ'tūs (Lat., from Gk. Πρωϊτος, *Proitos*). The son of Abas. He was expelled from Argos by his twin brother Acrisius, but with the assistance of Iobates of Lycia was restored to his kingdom. His three daughters were made mad by Dionysus or Iere and the contagion spread among the other women of Argos. They were cured by Melampus and Bias, between whom Prætus agreed to divide his kingdom. Bellerophon was charged by the wife of Prætus with improper proposals, and Prætus attempted to put him to death by means of a letter to Iobates. Perseus turned Prætus into stone through the sight of the Medusa head in revenge for his having expelled Acrisius from his kingdom.

PRÆTUS. A genus of trilobites, the species of which range through Ordovician to Carboniferous rocks, and are particularly common in the Devonian. They were small animals with a convex elliptical carapace, semicircular head, with prominent rounded labella and large eyes and distinct thickened margin. The thorax is made up of ten segments and its elevated axis is continued on to the semicircular marginate pygidium. See TRILOBITA.

PROFANITY. Contemptuous mention of or reviling of the name of God, His attributes, or religion. See BLASPHEMY.

PROFERT (Lat., he produces). Under the old common-law system of pleading, a statement or allegation in a declaration, that the plaintiff produces in court a deed or other instrument under seal on which he relies. See OYER.

PROFESSIONAL EDUCATION. The training that fits men for the special vocations in which science is applied to the practical purposes of life. It supposes as its basis the knowledge and discipline which general culture affords. The leading professional schools in the United States, following the example set by European universities, require a liberal education as a prerequisite for matriculation.

Professional education in Europe conforms to two general types: the centralized systems of France and Germany, and the more independent institutions of the British Isles. The French system since the Revolution has displayed at certain periods an extensive governmental control. This was confirmed by the Ferry legislation of 1879 and 1880 dealing with secondary and higher instruction, and relaxed somewhat by the act of 1896, which enlarges the powers of the universities and the responsibility of the communities in which they are situated. The bachelor's degree

is now required for entrance to State professional courses. Preparation for the professions is afforded by the faculties and schools of the State universities, and by the free (independent) faculties whose graduates must take the State examinations. There are 12 preparatory schools and 4 schools of full functions (*écoles de plein exercice*) teaching medical and pharmaceutical science, their students being examined for the doctorate by university faculties. In 1902 there were in the State institutions 127 students in Protestant theology, 10,472 in law, 8,417 in medicine, 3,346 in pharmacy. In private institutions there were 985 in law, 121 in medicine, and 15 in pharmacy. The course in Protestant theology covers three years; in law three years, there being added requirements in each for a doctorate; in medicine four, after which two years must be spent in hospital practice. Midwives are obliged to study for a year in an institution of medical instruction and undergo an examination. Diplomas are granted to foreign students, which confer the doctor's degree without conveying the right to follow a specified profession in France. The Government alone bestows degrees. With a few exceptions, the departments of France and Algiers maintain elementary primary normal schools for men and for women; some maintain superior primary normal schools; and Paris has two superior normal schools for men and for women teachers of secondary schools.

Professional training in Germany shows less than in France the influence of legislation and to a greater degree is built on the foundation of the early universities. The certificate of a gymnasium admits to professional courses. The 21 universities maintain faculties of theology, jurisprudence, and medicine, with the exception of Münster, which has no medical school. In 1902 the students of theology numbered 3926; of law, 11,335; of medicine, 7,341. The numerous pedagogic systems which German thought has produced have profoundly influenced the special preparation of the teacher and stimulated the development of teachers' training schools.

Professional education in Great Britain and Ireland is supplied by the universities of Oxford, Cambridge, Scotland's four university foundations, and the University of Dublin, and by a number of newer institutions, including London, Durham, and Victoria universities and the University of Wales. The Royal University of Ireland holds examinations in law and medicine. The Catholic University of Ireland comprises a medical school and several colleges in which theology is taught. A joint board appointed by the four Inns of Court in London examines candidates for admission to legal study in the Inns, and the Council of Legal Education, nominated by the Inns, superintends studies and examines students for the bar. There are numerous provincial medical schools. The preparation of teachers has enlisted much effort, denominational and undenominational; and many training colleges, for women as well as men, have been established.

In the United States there existed only two professional schools in 1776: the Medical College of Philadelphia (now the medical department of the University of Pennsylvania) and the medical department of King's (now Columbia) College, the former established in 1765, the latter

in 1768. Harvard University Medical School was established in 1782, and the Dartmouth Medical College in 1797. Theological instruction was obtained in the few colleges then existing, which were usually provided with chairs in Hebrew and theology. Private schools of divinity were not unknown; but the theological seminary proper was the product of a somewhat later day. The Seminary of the Reformed Dutch Church was established in 1784; Saint Mary's, in Baltimore, under the direction of the Society of Saint Sulpice, in 1791; and the Theological Seminary of the Associate Presbyterian Church

to education in husbandry and engineering, particularly the latter. In 1901 the departments of engineering and architecture in universities and colleges and the schools of technology reported students as follows: Mechanical engineering, 5623; civil engineering, 3532; electrical engineering, 2696; chemical engineering, 536; mining engineering, 1509; textile engineering, 234; architecture, 391.

The following table shows the respective ratios at the three periods between the numbers engaged in seven of the professions and the total population:

	Clergymen	Lawyers	Physicians	Dentists	Veterinarians	Engineers	Teachers
1860.....	837	947	576	5,608	80,212	1,145	284
1890.....	710	699	598	3,579	9,643	1,448	183
1900.....	680	663	575	2,563	9,303	808	173

of North America, at Service, Beaver county, Pa., 1794. The earliest law school in America was established at Litchfield, Conn., in 1784. The growth since the eighteenth century in the number, teaching force, equipment, endowment, and attendance of American professional schools has been remarkable. In 1901 there were 150 schools of theology, with 7567 students, 988 instructors, grounds and buildings worth \$15,217,164, endowments amounting to \$21,165,174, and libraries containing 1,531,038 volumes. The law schools numbered 100, having 13,642 students, 1106 instructors, grounds and buildings valued at \$1,875,000, endowment funds equal to \$1,151,920, and 338,167 volumes in their libraries. Schools of medicine numbered 154, having 26,757 students, 4752 instructors, grounds and buildings worth \$14,472,635, funds of the value of \$2,048,182, and 187,207 volumes. The 57 dental schools were attended by 8308 students, instruction was given by 1184 instructors, the value of grounds and buildings was \$1,213,122, and books numbered 6860. There were 58 schools of pharmacy, with 4429 students and 522 instructors. There were 12 veterinary schools, with 461 students, 189 instructors. Not less than 448 schools, connected with hospitals, with courses of two or three years, were engaged in the training of nurses, the number of whom under instruction was 11,599. In 1833 the first teachers' classes were formed in New York academies. The first American normal school was established at Lexington, Mass., in 1839. The number of public normal schools in 1901 was 170, with an attendance of 43,372. There were also 118 private normal schools, with an attendance of 20,030, while normal schools, universities, colleges, and high schools, aggregating 1461 institutions, were giving normal instruction to 94,157 students. That year 10,383 students graduated from normal schools. Delaware and Nevada are the only States without normal schools, and these make provision for the training of teachers. Engineering keeps step in development with the sciences of which it is an application and the material expansion which has called it forth. Provisions for instruction in the sciences which lead to the engineer's diploma have multiplied in an extraordinary degree in the last 40 years. The establishment of State colleges of agriculture and the mechanic arts in all the commonwealths under the Federal act of 1862 gave an impulse

The history of professional education is distinguished by the development of new professions, which for the most part have sprung out of the older professions by differentiation. Dentistry is an offshoot from the surgeon's art. Modern veterinary medicine may be said to have originated in attempts to apply the principles of pathology and therapeutics to treating the diseases of animals. In 1873 systematic training for nurses began in the Philadelphia Lying-in, Charity, and Nurse School, which opened in 1828. Medical practice has developed numerous specialties, such as the oculist's, the aurist's, the obstetrician's, besides the major division into physic and surgery. A comparatively recent division of medical practice is State medicine, which has to do with public restrictions for the protection of the general health. It should be noted that the profession of teaching is constantly subdividing; and in this movement a new educational function has been evolved, that of supervision and inspection, not yet recognized generally in special teaching courses, but accepted in all successful school systems. The decreasing proportion of men in the secondary schools of the United States is a fact which educators regard with interest and some concern.

Closely related to teaching is the new profession librarianship, already represented by four prominent schools, besides the departments of library science maintained in several universities. The New York State Library School receives only graduates of registered colleges, and the University of Illinois Library School limits admission to persons who have done three years of college work. The course in these two institutions is two years and leads to the degree of B.L.S. The four prominent schools have 36 instructors besides non-resident lecturers and 171 students. Accountancy is taking rank as a profession and is so recognized by statute in New York, Pennsylvania, Maryland, and California. The last few years have recorded the appearance of commercial courses in universities and academies, leading to diplomas and certificates as well as a title, certified public accountant (C.P.A.), which is protected by law.

Some of the States have exercised a potent influence by assisting in the rapid extension of the high school system, thus affording the means of a thorough preparation for the professional school. State universities maintaining profes-

sional and technical departments present still another form of State assistance. The United States Government has no jurisdiction over the practice of professions in the several States, but, owing to the efforts of the organizations in the several professions within the last thirty years, much has been done by State Legislatures toward protecting the public against incompetency. State supervision now extends to preliminary education, length of courses, degrees and the power to confer them, and entrance to practice, and is effected by means of registration, examination and license. By registration the status of schools and colleges and the value of their credentials receive State approval, and their graduates are admitted to examination for license. The tendency of special schools to become connected with some recognized university has also had a very salutary effect on professional education.

PROFESSIONAL WOMEN'S LEAGUE, THE. An organization in New York City, incorporated in February, 1893. The aims of the League are to bring together women engaged in dramatic, musical, literary, artistic, and scientific pursuits for mutual help and encouragement, to assist them financially when in need, to provide class instruction in literature, art, language, music, and other studies at lowest possible rates, and to assist members to obtain outfits necessary to securing employment. Active membership in the League is confined to women engaged in dramatic, musical, or literary pursuits. The dues for active and associate members alike are \$5.50 per annum, and in addition each member, upon being admitted to membership, pledges herself to contribute two articles yearly which can be either sold in the bazaar, or utilized in the costume department.

PROFESSOR, THE. A novel by Charlotte Brontë (1856), written in 1846. William Crimsworth, the hero, is a professor in a school in Brussels, where he meets Frances Henri, whom he marries. Several characters in the story are among the best of Miss Brontë's work.

PROFESSOR AT THE BREAKFAST TABLE, THE. A series of sketches and verses

by Oliver Wendell Holmes, contributed to the *Atlantic Monthly* and published in 1860. The plan is the same as in *The Autocrat of the Breakfast Table*, but the tone is more serious.

PROFIT (OF., Fr. *profit*, from Lat. *profectus*, progress, increase, profit, from *proficere*, to advance, make progress, be advantageous, from *pro*, before, for + *facere*, to make). The excess in the selling price of goods above their cost of production. The term has been variously used, both in common speech and in economic writings, according to the conception of the elements entering into cost. Many of the earlier economists did not regard interest as a 'cost,' and hence included it under the term profit. The rent of land, however, though not regarded as an element in cost, has not usually been classed with profit, although the term 'agricultural profit' is not infrequently applied to it in popular writings.

Modern economists usually exclude from profit the normal or average return to capital, which is classed as interest (q.v.). Whatever an enterprise earns above interest, rent, and wages (including normal wages of management) is profit. If this net income is due to an artificial raising of prices through manipulation of supply, it is known as monopoly profit, or monopoly return. Various theories have been advanced to explain the nature and causes of non-monopolistic profit. The oldest of these is the 'risk theory,' defended by Von Thünen and many later German and some American writers. A business undertaker necessarily incurs a large number of risks which are of too indefinite a nature to be covered by insurance. Since the chance of losing a certain sum is not compensated for by an equal chance of gaining the same sum, no one would undertake the management of business unless it normally afforded a greater volume of gains than of losses. The net gain, in this view, constitutes profit.

A second view, represented by Francis A. Walker, regards profit as a differential gain, imputable to superior management. Prices, it is held, are fixed in the long run by the cost to the least efficient managers who are able to continue production. All managers of greater efficiency produce at lower cost, thus securing a surplus analogous to rent (q.v.). A third theory, not differing from this in essence, ascribes profit to the scarcity of managers of the better grades. This theory sometimes confuses simple profit with monopoly return, through failure to distinguish between scarcity and monopoly values.

Finally, profit has been explained with reference to the dynamic elements that prevent industry from reaching an equilibrium. In this view, which is in the main that of J. B. Clark, labor and capital tend toward a state of uniform productivity, but, owing to friction and to technical improvements, may at any moment vary considerably in productive power. Since the pay of each unit of labor or of capital tends to equal the product of the unit least advantageously situated, those units which happen to be on the more productive situations yield a surplus or profit which the entrepreneur secures for himself. It would appear that the theories given are not mutually exclusive, but merely describe different elements in a composite form of income now commonly termed profit. See INTEREST; MONOPOLY.

PROFIT À PRENDRE, or, in brief, **PROFIT**. A right to take profit, that is, something produced or yielded by the land, from the land of another, as the right to take coal, minerals, gravel, seaweed, grass, game, etc. The right can be acquired only by grant or prescription, and can not be acquired by custom. Although often classed as an easement, especially when attached to other land, it is to be distinguished from a proper easement in that it involves more than a mere use of the land. See **EASEMENT**, and consult authorities referred to there and under **PROPERTY**.

PROFIT SHARING. A modified form of the wages system by which wage-earners receive a part of the surplus of the industry according to some understood plan. Overseers receive salaries, capitalists interest, wage-earners wages, and what remains is divided among these classes, who all are responsible for success or failure. A part or all of the wage-earner's share may be given in cash; or it may be held in trust, invested in capital stock as savings to be used by them in cases of emergency; or it may be used as a social, educational, or amusement fund.

Profit sharing is based upon the principle that work done varies with the degree of interest felt by those who perform it. Profits may be increased by the wage-earner by increasing the quantity of the product, by improving its quality, by better care of implements, by a decreased loss of materials, by lessening superintendence, and by avoiding quarrels with employers. The extent to which profits may be increased varies also with the extent to which the wage-earner is made a sharer in profits, the form in which his share is increased, his intelligence, and the character of the industry. Profit sharing has been successful in many industries, and has sometimes failed where the methods employed were copied from those which had met with success. Upon the whole profit sharing has been most successful in handicrafts where there is a stable market for the products, and where the price paid for labor is a large part of the cost of production.

The origin of profit sharing is unknown. It is said that the American financier Albert Gallatin made a trial of it in his glass works, established at New Geneva, Pa., in 1794. John S. Vandeleur, a disciple of Robert Owen, in 1831 tried an extensive experiment in profit sharing on an estate in the County of Clare, Ireland. It was successful in stimulating the interests of the laborers to the great improvement of the estate and of their condition, until it was unfortunately terminated through the loss of Vandeleur's entire property in consequence of his passion for gambling.

The first notably successful profit-sharing enterprise was begun by Le Claire, a French house painter, in 1842. At the time of his death in 1872, \$220,000 had been distributed to workmen as their share of the profits. According to his plan, capitalists received 5 per cent. on capital invested, managers were paid salaries, wage-earners wages, and then from the profits remaining, one-fourth went to the capitalist class, one-fourth to a Mutual Aid Association of Workmen, and one-half went to wage-earners directly. Since Le Claire's death his business has been conducted on similar lines. At the present time the Association of Workmen receives 5 per cent. of interest on its capital as a half owner of the business,

and also about 20 per cent. additional to its wages, which are about as high as those paid for similar lines of work in Paris. Laroche Joubert, a paper manufacturer, adopted the system in 1843, and the Orleans Railroad Company in 1844. In 1847 J. H. von Thünen introduced the system on his estate near Zellow, in Mecklenburg-Schwerin, where his son and grandson, succeeding in turn to the proprietorship, continued it in force. In 1875 there were about seventy-five profit-sharing establishments in France, and in 1878 a society of the proprietors and directors of these was formed in Paris for a comparative study of methods. Shortly after a profit-sharing scheme was recommended for the State, departments, and communes. The municipal council of Paris devised a profit-sharing arrangement to be used by the city contractors, but it was never put in operation.

In the Bon Marché, the largest retail store in the world, a scheme of profit sharing and industrial coöperation prevails. Of the capital to the amount of 20,000,000 francs, 7,500,000 is held by employees; 6 per cent. is paid on capital. The profits shared assume four forms; the heads of departments to over a hundred, whether they have capital invested or not, participate in the profits according to the percentage of sales; the retiring fund draws about 5 per cent. of the profits; the provident fund takes another share, and what remains is then divided pro rata. Another successful experiment in profit sharing was begun by Godin, a stove manufacturer, at Guise, about 1872. In the first fifteen years \$650,000 were distributed to the workmen in dividends, and a considerable amount besides was invested in capital stock. In France more than one hundred such enterprises are managed with success at present. Elsewhere on the Continent there are comparatively few instances. In Germany the piece-work system with prizes seems to be preferred. There are, however, 47 instances; in Switzerland, 14; Austria-Hungary, 5; Belgium, 6; Holland, 7; Italy, 8; and but nine in Spain, Portugal, Scandinavia, and Russia. In Great Britain there are 95 instances, and in the United States 23.

Conspicuous examples of successful profit sharing in the United States are those of the Proctor & Gamble Co., of Ivorydale, Ohio, and the N. O. Nelson Manufacturing Company, of Saint Louis, Mo. The former company employs largely unskilled wage-earners, who receive comparatively low wages. During the year 1886 the work of the company was interfered with by many strikes, and in the following year profit sharing was introduced to establish harmonious relations with the employees. Reasonable salaries were allowed the active members of the firm, interest was allowed on the capital, and the net profits were divided between the firm and "the employees, in the proportion that the wages paid bore to the whole cost of production." Altogether the profits received by the wage-earners increased their income considerably, they were indifferent to the success of the enterprise until the company divided them into four groups based upon their interest in the work, its excellence, and the prevention of waste. The best group received twice the regular dividend, the second the regular, the third one-half the regular dividend, while the careless and indifferent received none at all. The wholesome influence of this discrimination was at once

seen in larger dividends. The stockholders did not profit directly by this scheme, but the better profited at the expense of the poorer workmen. When the firm became a stock company, in 1890, wage-earners were to receive a dividend of 12 per cent. on wages, which was the same as the profits on common stock. The number of employees receiving profits increased from 225 in 1887 to 550 in 1899, the latter number being 92 per cent. of the total number of wage-earners. Employees are encouraged to become owners of stock and 80 of them own 191 shares. Beginning with 1894, \$500 is set aside semi-annually as a pension fund, of which one-half is contributed by the company and the other half comes from the bonuses of the employees. Since the beginning of the experiment no strikes or labor difficulties have arisen. In 1894 the labor cost, including the 12 per cent. bonus to wage-earners, was only 63 per cent. of what it had been in 1886.

The N. O. Nelson Co., brass manufacturers of Saint Louis, Mo., began a profit-sharing enterprise in 1886. The company pays out all sums needed in cases of sickness and disability as they occur, as a part of the costs of the business. Allowances are made for funeral expenses, and upon the death of an employee his family is supported to the extent of two-thirds of his wages, until it is able to support itself. The crucial test of profit-sharing enterprises is given in periods of crises, when extra efforts of wage-earners are not rewarded by dividends. It is then that wage-earners lose interest in them, and the mortality rate of profit-sharing enterprises is high. For the first ten years, 1887-1897, the dividends to employees were large. In two years, 1893 and 1896, there were no dividends for employees. That no labor difficulties arose and that wage-earners did not lose interest in profit sharing, even though wages were reduced one-fourth, was due largely to the wisdom of the company. Salaries and interest were reduced to the same extent as wages, but the one-fourth thus deducted from these shares was to be paid out of future profits before any bonuses were to be paid. In each instance it was not long before the company was on a dividend-paying basis and profit sharing weathered the storm in safety. One other feature of the management of the N. O. Nelson Company shows how profit sharing may pave the way to industrial coöperation. In 1896 the company made a proposal to employees in the cabinet-making shop which provided for the gradual purchase and management of the enterprise by the employees. The proposal, at first rejected, with a few changes was soon after accepted, and at present this department is owned and managed exclusively by employees.

On January 1, 1903, the United States Steel Corporation announced a plan of profit sharing. Only those employees who hold positions of responsibility share directly in the profits of the corporation. If the net earnings for the year exceed \$80,000,000, but are less than \$90,000,000, one per cent. of such earnings is to be distributed among the employees, the share to be determined by the finance committee, so as to permit the fullest recognition of merit. With every \$10,000,000 increase in net earnings, the share to be distributed increases by $\frac{1}{2}$ per cent. of such increase of earnings. Employees of lower classes are given favorable opportunities for becoming owners of the corporation stocks. To further encourage the

holding of stocks, those who buy such stocks and remain in the service of the company are to receive at the end of five years a bonus of 5 per cent. annually on the face value of the stock held over and above the regular dividends, and the promise of a bonus at the end of another five years is given. A large number of the employees have already acquired stock. It is hoped that this plan will insure stability on the part of the mass of the workmen and the maximum of zeal on the part of the higher employees.

The recent record of profit sharing in the United States has not been such as would give encouragement to its ardent supporters. In 1889 there were thirty-four institutions in the United States, while there were but twenty-three ten years later, and of these twelve have been organized since 1899. Aside from these failures several others were attempted and soon after abandoned. A variety of causes contributed to the abandonment of these institutions during this period. The long period of the financial crisis went hard with all of them, and especially with those which had but recently attempted profit sharing. Changes in management were responsible for its abandonment in other cases. Impatience of success, and abandonment before a fair trial was given, was the situation in a number of other cases. To lack of seriousness in dealing with the matter and to unwisdom in management may be attributed still other failures.

That profit sharing is a scheme which will settle the great difficulties between labor and capital none but its most sanguine advocates would claim. But that it may be used in many enterprises to bring about harmony between the employer and the employee, to elevate workmen and to prepare the way for industrial coöperation, has been proved by experience in institutions which have passed beyond the experimental stage.

PROGNO'SIS (Lat., from Gk. πρόγνωσις, foreknowledge, from προγινώσκειν, *proginōskein*, to know beforehand, from πρό, *pro*, before + γινώσκειν, *ginōskein*, to know). The opinion or decision of the physician as to the probable course and termination of a disease. As the case proceeds, the rapidity or severity of the symptoms, the condition of the circulation, ability to take food, the integrity of the nervous system, are points which influence the prognosis. The usual questions to be answered by a skillful prognosis are as to whether the disease will terminate in death or recovery; if in recovery, whether permanent damage to any organ will result; if in death, the probable duration of the disease.

PROGRAMME MUSIC (Lat. *programma*, from Gk. πρόγραμμα, edict, from προγράφειν, *prographēin*, to write before, from πρό, *pro*, before + γράφειν, *graphēin*, to write). A term in music applied to purely instrumental works which are

intended to reproduce by musical tones a series of definite ideas or events. The idea of reproducing characteristic sounds of nature by means of music is very old. We have a composition by Jannequin, *Cris de Paris*, published in 1529, in which are imitated the cries of Parisian fishmongers and venders of various commodities. In another, *La Bataille*, the same composer imitates the rattling of musketry, trumpet-signals, etc. In his "Pastoral Symphony" Beethoven reproduces the murmuring of the brook and the calls of various birds. Schubert in his famous song *Gretchen am Spinnrad* imitates admirably the hum and buzz of the spinning-wheel by the figure in the accompaniment. But Schumann went further; he gave some purely instrumental works (Carneval) suggestive titles. These instances do not in reality constitute programme music. This form began with Liszt, who wrote long orchestral works (symphonic poems) where every bar is meant to depict some definite emotion or event. He found his inspiration in works of poetry or the plastic arts. Thus *Die Hunnenschlaecht* is intended to reproduce in musical tones the impression aroused by Kaulbach's famous picture. In his Dante and Faust symphonies Liszt has taken certain episodes from Dante and Goethe, and he intends to say in music what the two poets have said in words. This school of programme music has had many followers and is still very powerful. (See STRAUSS, RICHARD.) Opinions differ as to the value of such music. In Schumann's sense Raff and Saint-Saëns, and even Schubert and Beethoven, have written programme music. But these masters never forced music beyond its natural limits. Wagner occupies a distinct position. In one sense his music is programme music, but it is dramatic, and always accompanies and illustrates the spoken word. And even in the purely instrumental passages, such as the Preludes, Siegfried's Rhine-Journey, Funeral March (*Götterdämmerung*), his method of leading motives enables the hearer to follow every bar in detail. Richard Strauss also has taken up this idea of leading motives and applied it to purely instrumental works (*Death and Apotheosis, Till Eulenspiegel, Ein Heldenleben*, etc.). See SYMPHONIC POEM; INSTRUMENTAL MUSIC.

PROGRESO, prô-grâ'sô. A seaport of Mexico, situated on the north coast of the Yucatan peninsula, 25 miles north of Mérida (Map: Mexico, O 7). It is the port of that city, and is connected with it by railroad. It is the principal port of the State of Yucatan, and one of the foremost ports of the Republic in regard to imports. Steamship lines connect the town with Vera Cruz and various ports of the United States. A United States consulate is located here. The chief export is sisal grass. Population, in 1895, 5911.

PROGRESS AND POVERTY. A work by Henry George. See GEORGE, HENRY.

PROGRESSION (Lat. *progressio*, from *pro-gredi*, to go forward, from *pro*, before, for + *gredi*, to go), or PROGRESSIVE EVOLUTION. Nägeli's principle of progression, or the transformation of species from internal causes. Long before Nägeli, Von Baer vaguely wrote of the striving toward an ideal in development. Nägeli and his commentator, R. Hertwig, claimed that it cannot be denied that each species is compelled, by some peculiar internal cause, to develop into new forms independently of the environment, and up to a

certain degree independently of the struggle for existence. In all the branches of the animal kingdom, says Hertwig, we observe a progress going on from lower to higher, very often in a quite similar way, in spite of the fact that the species live under very different conditions of development. To a certain extent, then, an organism is independent of the external world, but the independence is never complete, and Nägeli has not so contended.

PROGRESSION. In music, a term applied to the succession of entire chords or of the individual tones composing any part. The former is called *harmonic*, the latter *melodic* progression. The progression of dissonances is called resolution. See LEADING OF VOICES.

PROGRESSIONS (in mathematics). See SERIES.

PROGRESSIVE BROTHERS. See GERMAN BAPTIST BROTHERS.

PROHIBITION (Lat. *prohibitio*, a forbidding, prevention, from *prohibere*, to forbid, prevent, from *pro*, before, for + *habere*, to have). A form of sumptuary legislation which attempts to abolish the manufacture and sale of alcoholic liquors. Until after the Civil War the movement toward prohibitive legislation in America was merely local. By that time, however, a marked change was observed in the liquor business. German beer was introduced, great breweries were built, attractive saloons were fitted up, and other efforts were made to increase sales. One of the earliest State and national forms of prohibition forbade the sale of liquor to Indians. Some of the early laws enacted local option—which may be local prohibition—following Connecticut's (1839) example. Maine was the first State to establish prohibition. The West Indian trade brought large quantities of rum into the State, and in 1846 an educational campaign was carried on, which resulted in Neal Dow's law. This law was made effective in 1851 and was finally incorporated into the State Constitution. In 1852 Massachusetts, Rhode Island, and Vermont passed laws prohibiting the sale of liquor, which were subsequently repealed by the two former States. Massachusetts presents an excellent example of local option, each town voting to license or not to license the sale of alcoholic drinks. Kansas (1890) and North and South Dakota have constitutional prohibition. Iowa passed a constitutional amendment in 1882, which was declared void, and was superseded by a statute (1884). In 1894 the Mule Law took its place. Prohibitory constitutional amendments have been defeated in Texas, Oregon, Tennessee, Pennsylvania, Nebraska, and Massachusetts. New Hampshire's statute of 1855 was repealed in the spring of 1903 and local option was adopted. In the South, which is strongly for temperance, the States provide as a rule for local option by counties. For the dispensary system in South Carolina, see under that State.

PROHIBITION PARTY. The failure of the advocates of temperance to force a prohibition plank upon either of the great national parties led the Pennsylvania State Temperance Convention in February, 1867, to suggest the organization of a separate party. In 1868 a Prohibition Party was organized in Illinois and Michigan in response to a recommendation made on May 28th of that year by the Grand Lodge of the Good

Templars in session at Richmond, Ind. In May, 1869, the Grand Lodge recommended the calling of a national convention, and in September such a convention was held at Chicago and the National Prohibition Party was there organized. In the State elections of the next three years candidates were nominated by the party, but received relatively few votes. On February 22, 1872, the first National Convention met at Columbus, Ohio, nominated James Black of Pennsylvania and John Russell of Michigan as their candidates for President and Vice-President respectively, and adopted a platform which besides advocating prohibition declared for woman suffrage, a direct popular vote for President and Vice-President, a sound currency, the encouragement of immigration, and a reduction in transportation rates. In the ensuing election only 5,607 votes were cast for the party's candidates. In 1876 Green Clay Smith of Kentucky was nominated for President and G. T. Stewart of Ohio for Vice-President, but the ticket received only 9,787 votes. In 1880 the candidates for President and Vice-President, Neal Dow of Maine and H. A. Thompson of Ohio, received 9,678 votes. In 1884 Governor Saint John of Iowa was nominated on a platform which, ignoring other issues, declared only for temperance. He made an active campaign and received 150,626 votes. In 1888 the Prohibition candidates, Clinton B. Fisher of New Jersey and John A. Brooks of Missouri, received 249,954 votes, the platform in this year declaring for woman suffrage, uniform marriage and divorce laws, restriction of immigration, a tariff for revenue only, and civil-service reform. In 1892 the platform of the party, besides declaring for prohibition, advocated, among other things, woman suffrage, civil-service reform, anti-monopoly laws, currency reform, and restriction of immigration. In this year the party's candidates, John Bidwell of California and J. B. Cranfil of Texas, received 270,710 votes, the largest number so far recorded. A split in the party occurred in 1896. The party in the South was opposed to a woman's suffrage plank and the delegates were divided on the money question. Those who wished to confine the party to a single issue were in the majority, and their opponents left to form a Liberal Party, whose candidate, Bently, received only about 14,000 votes. The regular candidate (Levering) received 131,757 votes. Dr. S. C. Swallow, who represented the broad-gauge party in 1900, was defeated by John G. Woolley, the nominee of those advocating the single issue, who in the Presidential election received 207,368 votes. The party never had a purely national issue until 1900, when the question of the army canteen and liquor in the Philippines attracted attention. The party organ is *The Voice* (New York City), started September 25, 1884.

In a treaty of 1889 between the United States, Great Britain, and Germany prohibition for the Samoan Islands was established. Canada took a plebiscite on prohibition, September 29, 1898, on which occasion 278,487 votes were yeas and 264,571 nays. Since the majority vote was only 23 per cent. of the electorate, the Government has not felt called upon to initiate legislation. In England the United Kingdom Alliance to procure total and immediate legislation for the suppression of traffic in intoxicating liquors and beverages has worked actively for prohibition. The

question of compensation forms a financial barrier to the enactment of a law. In the United States the Supreme Court (December 5, 1887) decided that the Kansas law making no provision for compensation does not violate the Fourteenth Amendment. Prohibition has had no complete trial in the United States, because of the interstate commerce laws. The 'original package' case (*Bowman vs. Chicago and Northwestern R. R.*, 125 U. S. 465) stated that no prohibition States could prevent interstate railroads and express companies from carrying liquors to any point within the State. The conclusions indorsed by the Committee of Fifty, a voluntarily constituted group of distinguished men, who have long been engaged upon a thorough investigation, are: (1) That prohibition has abolished or prevented the manufacture of liquor on a large scale within certain areas; (2) that the suppression of retail trade is dependent upon local sentiment, and is more successful in the country than in the city; (3) that efforts to enforce the law lead to hypocrisy, bribery, corruption, and law-breaking.

Consult: Wheeler, *Prohibition: the Principles and the Party* (New York, 1889); *Cyclopædia of Temperance and Prohibition* (ib., 1891). See TEMPERANCE.

PROHIBITORY DUTIES. See **TARIFF.**

PROJECTILES (from *project*, OF. *projecter*, *projeter*, Fr. *projeter*, to project, from Lat. *pro-jectare*, to thrust forth, frequentative of *projicere*, to throw forward, from *pro*, before, for + *jacere*, to throw; connected with Gk. *βάπτειν*, *iaptein*, to throw). Objects thrown forward by an impulse of short duration. Projectiles have been a form of offensive weapon from the earliest days of warfare when a stone or similar missile was thrown from the hand or from some simple device. The development of guns (see **ARTILLERY**; **GUNS, NAVAL**) necessitated suitable forms of projectiles. The earliest were of stone, sometimes merely bags of round pebbles. The larger stone projectiles were made to fit the gun loosely and were generally, though not always, spherical and often very neatly and smoothly cut. A few stone elongated projectiles are known to have been used, but they were not common. Iron projectiles came into general use in Europe in the fifteenth century, though stone was used more or less for some centuries after this. The difficulty of tightly closing the breech caused the disuse of breech-loading cannon and prevented the early development of the heavy rifled gun. Rifled small arms (q.v.) using a spherical bullet have been in more or less use for three centuries. Smooth-bore guns almost invariably used spherical projectiles very slightly smaller than the bore of the gun, the difference being termed the *windage*.

The resistance to the movement of a projectile through the air is proportional to the cross-section perpendicular to the line of flight, and the power of the projectile to overcome the resistance is proportional to its weight multiplied by the square of the velocity. For a given velocity, therefore, we may say that the ratio of power of resistance varies roughly as $\frac{W}{D^2}$ where W is the weight and D the diameter expressed in the usual units. This is not strictly correct, for there are other factors (shape, den-

sity of atmosphere, etc.) which enter into a precise calculation, but the statement is approximately true and the expression $\frac{W}{D^2}$ is called the

ballistic coefficient. It is apparent by inspection that if we have means of increasing the weight without increasing the diameter (that is to say the area of cross-section) we shall increase the power of the projectile to overcome the resistance of the air and thereby add to its range and accuracy. The elongated projectile evidently fills the desired conditions and the advantages of its use are at once apparent. Robins published his treatise on Ordnance in 1742, and in it he stated very clearly the advantages of rifled guns and elongated projectiles (see GUNS, NAVAL), but his work was far beyond the comprehension of his contemporaries. (See PROJECTILES, MOTION OF, below.) The use of smooth-bore guns and spherical projectiles continued, and the next important improvement was the development of the shell gun. Incendiary shells designed to burst and scatter balls and fragments of the case had been in use for a long time, but up to 1820 these had very thin walls and were fired solely from mortars. In 1821 the Paixhans shell gun was designed in France, and thereafter explosive shells have formed the greater part of projectiles above a pound in weight.

About the middle of the nineteenth century the rifled gun established itself firmly. Difficulties in the breech mechanism caused some nations to develop muzzle-loading systems of construction, but this false step lasted nowhere more than twenty-five years. The projectiles for muzzle-loaders necessarily did not fit closely, and this decreased their accuracy. The revolution of an elongated projectile about its axis is necessary to keep the axis steady and prevent the projectile from 'tumbling' or pitching end over end, which would be fatal to power and accuracy. This was effected in muzzle-loaders by means of various rotating devices such as studs, ridges, expanding base rings or bands, or a bore of special cross-section such as that of a polygon or ellipse.

Muzzle-loading projectiles.

The difficulties connected with developing an effective breech mechanism were soon surmounted and modern projectiles quickly took on very nearly their present oblong shape. With breech-loaders the band could be made larger than the bore (being inserted from the rear) and forced in, the lands or grooves of the rifling cutting their way through the soft metal band. Projectiles for breech-loading rifles were first made of plain cast iron and wrought iron, but the advances in armor brought forth first the chilled cast-iron armor-piercing shot and shell, and then the steel shell. For a long time common shells not intended to pierce armor, were made of cast iron,

and some countries still use cast-iron common shell; but in the United States Navy all shells are of forged steel. The common shells have hardened points and are intended to pierce armor two-thirds of a calibre in thickness, while the

ARMOR-PIERCING PROJECTILE SHOWING STEEL CAP.

armor-piercing shells are designed to pass through any thickness through which they can be driven, not only without breaking up by the shock, but without deformation. Armor-piercing projectiles of a calibre exceeding six inches are not generally loaded, as their walls are so strong that gunpowder charges will not burst them. Several high explosives have been successfully employed for these shells, but none has been definitely adopted for shells of all calibres. (See EXPLOSIVES.) To further increase the penetrative power of armor-piercing shells, they are fitted with a soft steel cap over the point. This cap is cylindrical and about a quarter of the calibre of the shell in diameter, while its height on the outside is about equal to its diameter; inside, the point of the shell extends well up into it. When the projectile strikes a hard-faced armor plate the force of the blow, acting through the cap, slightly dishes the face of the plate and thus strains the metal; while under this strain the point of the projectile passes through the cap and easily ruptures the strained material.

In the United States and British navies shells are about $3\frac{1}{2}$ calibres in length, and their weight is approximately equal to one-half of the cube of the calibre (expressed in inches). In the United States Army guns, the weights of projectiles are about one-sixth greater.

In addition to the two kinds of shell mentioned, shrapnel are used in modern rifled guns, especially in the modern field guns, and in some pieces canister is occasionally employed. Shrapnel are shaped like shell, but have thinner walls and are filled with lead or iron balls from half an inch to an inch in diameter held in a resin

UNITED STATES ARMY 3.2-INCH SHRAPNEL.

matrix or by metal rings. A small bursting charge, located either at the front or rear, breaks up the case in the air and the balls scatter and fly onward, spreading out like shot from a shotgun. In canister the balls, larger than those in shrapnel, are sunk in soft-wood disks piled up to form a cylinder, and the whole covered with a tin case; or, in small calibres, the balls are simply packed in sawdust and enclosed in a cylindrical tin case with wooden ends.

In the days of smooth-bore guns many kinds of projectiles were used, as bar shot, chain shot,

grape shot, hot shot (these were heated in special ovens), shrapnel, canister. Grape shot consisted of iron balls piled around a central spindle rising from a disk which was nearly equal in diameter to the calibre of the gun. A ring of the same size as the disk rested over the outer parts of the balls of each layer, and the next layer above rested partly in the ring. While the rings kept the balls in position, they were additionally held by a canvas cover lashed down tightly over the balls. When the gun was fired, the balls broke loose, but the rings and canvas kept them somewhat together for a considerable distance from the muzzle.

To reduce the expense of target practice (q.v.), sub-calibre ammunition is greatly used. A smaller barrel is fitted in the bore of the gun and its own projectiles used in it. In the United States Navy, one-pounder guns are fitted in the breech of guns of five-inch calibre and larger—musket barrels being used in the smaller guns. To further decrease the cost of the practice, the shells are cheaply made and are *blind* (i.e. they have neither bursting charges nor fuses). See articles on AMMUNITION; ARMOR PLATE; ARTILLERY; EXPLOSIVES; FIELD ARTILLERY; GUNS, NAVAL; BALLISTICS; GUNNERY; ORDNANCE; etc.

PROJECTILES, MOTION OF. By this is understood the path followed by a particle of matter projected either obliquely upward, or horizontally from a height above the earth's surface. The problem of predicting this path was solved by Galileo, the solution depending upon the assumption that the horizontal velocity of projection of the particle is unaffected by the vertical force of gravity which produces a constant vertical acceleration g (approximately 980 on the C.G.S. system). If the particle is projected in an oblique direction upward, which makes the angle θ with the horizon, with a velocity V , it will have a horizontal component $V\cos\theta$, and a vertical one $V\sin\theta$. The former remains unaltered; the latter is subject to a *negative* acceleration g . The particle will continue to rise until the initial vertical velocity is decreased to zero. If t is the time of ascent $gt = V\sin\theta$ or $t = \frac{V\sin\theta}{g}$. In this time the particle will have gone horizontally a distance $V\cos\theta \times t$ or $\frac{V^2\cos\theta\sin\theta}{g} = \frac{1}{2}\frac{V^2\sin 2\theta}{g}$.

After the particle reaches its highest point, it will fall and will take the same time to reach the horizontal plane through its point of projection as it did to rise to the summit of its path. In the entire time, therefore, of rising and falling, the particle will move horizontally a distance $\frac{V^2\sin 2\theta}{g}$. Since the time taken to rise to its highest point was $\frac{V\sin\theta}{g}$ against an acceleration g , the height of this point is $\frac{1}{2}gt^2$, or

$\frac{1}{2}\frac{V^2\sin^2\theta}{g}$. For a given value of V , the greatest distance of horizontal motion, — $\frac{V^2\sin 2\theta}{g}$ is

when $\sin 2\theta$ has its greatest value, viz. 1; for this $2\theta = 90^\circ$, and hence $\theta = 45^\circ$. (This conclusion is seriously modified in practice by the resisting action of the air.)

The path of the particle may be deduced: if horizontal distances are called x , and vertical ones y , then at a time t after projection

$$\begin{aligned} x &= tV\cos\theta \\ y &= tV\sin\theta - \frac{1}{2}gt^2 \end{aligned}$$

If t is eliminated from these equations,

$2yV^2\cos^2\theta = xV^2\sin 2\theta - gx^2$, which is the equation of a parabola.

In the simplest case, when the point of projection is at a height above the surface of the earth, and the particle is projected horizontally with a velocity V ,

$x = Vt$, $y = -\frac{1}{2}gt^2$ where y is vertically down.

Eliminating t , these equations give $y = \frac{g}{2V^2}x^2$.

As a solid moves through the air, it meets opposition of various kinds due to the air. There is an opposing force which diminishes the linear speed. For speeds less than 100 feet per second the resistance of the air varies directly as the square of the velocity, as stated by Newton. According to Duhemin (1842), this resistance $= av^2 + bv^3$ for speeds below 1370 feet per second, and $= cv^4$ for higher speeds. In these expressions v is the speed of the projectile and a , b , c , are factors of proportionality. The first formula has been verified by the recent work of Dr. A. F. Zahm.

If the projectile is rotating on an axis, the angular speed is decreased, owing to friction; and owing to the unequal friction on the various sides, there is a sidewise force producing the 'curves' of a baseball and the 'drift' of a bullet. If the projectile is elongated or broad, the centre of pressure of the air against it and its centre of inertia are not in general in the line of motion; so there is a moment tending to make the projectile turn around an axis at right angles to the plane including the line of motion, the centre of pressure, and the centre of inertia. If the projectile is not rotating, it will turn so as to move with its broadest face front; e.g. a penny falling in water falls face down, not edge down; a sheet of cardboard falling through the air tries to fall face down. If, however, the projectile is rotating around an axis, e.g. an elongated bullet, the effect is to change the direction of the axis.

PROJECTION (Lat. *proiectio*, from *proicere*, to throw forward). The act or result of constructing a figure upon a given surface, usually by means of a pencil of rays, so that it corresponds point by point to another given figure. It thus includes perspective (q.v.), and is most simply illustrated by the shadow of an object thrown by a light on a wall, the shadow being the projection, and the light being the vertex of the pencil or sheaf of rays. If the centre of projection is infinitely distant the projection is called *parallel* projection; if also the projection rays are perpendicular to the plans of projection, we have *orthogonal* projection: The theory of projections is of great importance, both in mathematics and in geography, being in the former

case perfectly general in its application, while in the latter only the projection of the sphere is required. Projections of the sphere are of various kinds, all of which are treated under MAP.

In mathematics, the theory of projections has reached a high degree of perfection, serving to generalize the ancient geometry. (See GEOMETRY.) Its basis is the investigation and determination of those properties which, being true of a figure, are also true of its projections, such properties being necessarily dependent, not on the *magnitude*, but on the *position* of the lines and angles belonging to the figure. These properties are generally called *projective* properties. For instance, the three conic sections (q.v.), the parabola, ellipse, and hyperbola, are merely various projections of a circle on a plane, and all *positional* properties of the circle are at once, by this theory, connected with similar properties of the three conic sections. The introduction of coördinates has extended the applications of the subject, and it is now employed in solving the problems of applied mathematics.

For further information, see the references given under GEOMETRY. For the use of projection in mechanics, consult: Poisson, *Traité de mécanique* (2 vols., Paris, 1811); Klein, *Theorie der Kreisels* (2 vols., Leipzig, 1897-98); and Stade and Seidel, *Das Wichtigste aus dem geometrischen Zeichnen und der Projektionslehre* (Leipzig, 1894).

PROJECTIVE GEOMETRY. A geometry in which the properties and relations are investigated by means of the theory of projections. See GEOMETRY; PROJECTION.

PROKESCH-OSTEN, prō'kësh ôs'ten, ANTON, Count (1795-1876). An Austrian diplomat and author, born at Gratz. He entered the Austrian Army, served in the French campaign in 1813-15, was made professor in the military school of Olmütz (1816), and, after serving as adjutant to Prince Schwarzenberg (whose memoirs he published in 1822), was sent on diplomatic missions to the East. In Greece and Syria he was very successful, and for his services in bringing about the treaty of 1829 with the Pasha of Akka, whereby Christians were granted many privileges in Palestine, he was ennobled with the title of Von Osten (1830). In 1831 he was chief of staff in the Austrian army sent to Bologna, and he was Minister to Athens in 1834-49, and to Berlin, with the title of Ambassador, in 1849-52. He was ambassador to the Frankfurt Parliament in 1853-54 and from 1855 to 1871 represented Austria at Constantinople. He was made a baron in 1845 and a count in 1871. His more important works are *Erinnerungen aus Aegypten und Kleinasien* (1829-31) and *Geschichte des Abfalls der Griechen vom türkischen Reich* (1821).

PROLAPSUS ANI (Lat., falling of the anus). An affection of the terminal portion of the intestinal canal which consists in a protrusion of the mucous membrane of the lower part of the rectum through the anal orifice. When the protrusion includes the whole thickness of the rectal wall the condition is known as *prolapsus recti*. These conditions may depend on a naturally relaxed condition of the parts, such as exists in infancy, or they may be brought about by violent straining as in cases of costiveness, hæmorrhoids, and so on. Whenever prolapse occurs, the parts should be washed, and,

if possible, replaced by careful pressure with the fingers; and if they do not easily return, the forefinger should be oiled and pushed up into the anus, when it will convey the protruded intestine with it, after which the patient should maintain the recumbent posture for some hours. If the protrusion cannot be returned by the above means, surgical assistance should be at once sought. In order to obviate the tendency to prolapse the patient should regulate the bowels so as to avoid costiveness and should sponge the parts, after each evacuation, with cold water. A firm pad is sometimes required to prevent recurrence. Where the trouble persists it may be necessary for the surgeon to provide retraction of the redundant mucous membrane by removing portions of it either by the knife or the cautery. In cases of severe prolapse of the whole of the rectal coats it may be necessary for the surgeon to resect a portion of the rectal wall.

PROLAPSUS UTERI (Lat., falling of the womb). The condition in which the womb falls below its natural position in the pelvic cavity and approaches the outlet of the vagina. If the womb appears outside it is known as *proidentia*, or complete prolapse. Thus we have all degrees of prolapse from a very slight depression to a complete extrusion, and in its descent not only does the womb itself fall down, but it drags with it the vaginal walls, usually a part of the bladder, and less frequently the rectum. The prolapsed portion of the bladder is known as a *cystocele*, that of the rectum as *rectocele*. Prolapse of the uterus is a very common affection, occurring most frequently in women past middle age who have borne many children; but it is also found in unmarried women, and rarely in children. The causes are: (1) Relaxation of the ligaments that normally hold the uterus in place; (2) weakening of the support below due to a loss of tone in the tissues or to injury or laceration during labor; (3) an increase in weight in the uterus, either from congestion or disease; and finally (4) an increased pressure within the abdomen forcing the uterus down, as in straining from constipation. The symptoms of this affection arise partly from the pressure of the womb on other organs, partly from the simultaneous displacement of adjacent parts (as the bladder, rectum, etc.), and partly from reflex action. Patients with only a slight displacement usually complain of a sensation of fullness in the pelvis, of weight and bearing down, of dragging pain in the back, these symptoms being aggravated when the upright position is assumed. The treatment varies with the degree of displacement. In cases of complete prolapse the uterus should be replaced and retained in position if possible by mechanical means, such as tampons of cotton or pessaries or rings. In extreme cases removal of the entire organ may be necessary to afford relief. In cases of moderate severity great improvement is further secured by increasing the general tone of the tissues by tonics and constitutional treatment and by douches and other forms of local applications. The improvement in the general health is of great importance. In many instances an operation is necessary for the repair of the lacerated tissues at the pelvic outlet. Where neglected the condition has a tendency to become aggravated and rectal and bladder symptoms make themselves evident.

PROLÉTAIRES, prô'lâ'târ' (Fr. *prolétaire*, from Lat. *proletarius*, one of the lowest class of Roman citizens, regarded as of value to the State only on account of their offspring, from *proles*, progeny), or PROLETARIATE. That part of the wage-earning class who are entirely dependent on their daily labor for their livelihood. See SOCIALISM.

PROLOGUE (OF, Fr. *prologue*, from Lat. *prologus*, from Gk. *πρόλογος*, preface, introduction, from *πρό*, *pro*, before + *λόγος*, *logos*, speech, word, reason, ratio). In ancient Greek drama, that part of a play (whether an acted scene or an exclamatory speech) which came before the entrance of the chorus. Thus the prologue in the *Œdipus* of Sophocles is a scene in which appear *Œdipus*, the high priest of Zeus, and Creon, whereas the prologue to the *Agamemnon* of *Æschylus* is only the monologue of the watchman on the tower. From the time of Euripides the prologue became a speech explanatory of the situation to be developed, and it continued to be such in Latin comedy. With Plautus and Terence the prologue was divorced from the main body of the drama. In the early English drama the duties of setting forth the theme were shared by the induction, or prologue, and the chorus. When the induction was falling into decay the prologue or chorus supplied or assisted the argument. Their double employment is exemplified in *Hamlet* in the play scene. When the prologue enters, Hamlet says: "We shall know by this fellow; the players cannot keep counsel; they'll tell all." Hamlet explains to Ophelia the relationship of Lucinius and the King, and Ophelia responds, "You are as good as a chorus, my lord." In *Henry the Fifth* a prologue, called 'chorus,' precedes each act, to prepare the audience for the shifting scenes. For other plays Shakespeare wrote no prologue, but in the first scenes he both explained and developed the situation. After the Restoration (1660) a play was hardly complete without its prologue and epilogue. Even in Dryden's time the prologue served as a subject for literary wrangling as often almost as it served any dramatic purpose. Modern plays, save for quaintness' sake, never have a prologue. On the other hand, the playwright is bound to set forth in the first scene the problem or theme to be handled in his play. Thus we observe something like a steady degeneration of the prologue in proportion as the playwright begins more and more to make the main body of his drama a unit of thought and action. Consult G. S. B., *The Prologue and Epilogue in English Literature from Shakespeare to Dryden* (London, 1884). Taken over into oratory the word prologue is also applied to the opening of a speech. See EPILOGUE.

PRÖLSS, pröls, JOHANNES (1853—). A German novelist, son of Robert Pröls. He was born in Dresden, studied at Jena and Leipzig, was literary editor of the *Frankfurter Zeitung* (1880-89), and of the *Stuttgarter Union* (1890 sq.). He wrote some lyric poetry, a life of Schefffel, and a series of novels and sketches: *Emancipierte Novellen* (1880); *In der Alpen-schutzhütte* (1889); *Modelle* (1891); *Das junge Deutschland* (1892); and *Bilderstürmer!* (1895).

PRÖLSS, ROBERT (1821—). A German dramatist and historian of the drama. He was born in Dresden and was at first a merchant there, but

after 1863 gave himself up wholly to literature. In 1847 he wrote *Das Recht der Liebe*, a comedy. His later plays were the tragedies *Sophonisbe* (1862), *Michael Kohlhaas* (1863), and *Katharina Howard* (1865), and the comedies *Eine edle That* and *Die verdächtige Wahrheit*, after Alarcón. His critical and historical essays include: *Erläuterungen zu Shakespeares Dramen* (1874-89); *Das Meiningensche Hoftheater und die Bühnenreform* (1876); *Katechismus der Dramaturgie* (1877; 2d ed. 1899); versions of Marlow, Webster, and Massinger (1880); a life of Heine (1886); and *Kurzgefasste Geschichte der deutschen Schauspielkunst* (1900).

PROME, pröm. The capital of a district in Burma, British India, at the confluence of the Nawin with the Irrawaddy, 113 miles north-west of Pegu (Map: India, B 3). It was formerly surrounded by a brick wall, palisade, and ditch, about two miles in circuit. On account of the flatness of the ground on which it stands, the town is often inundated from the Irrawaddy. The principal thoroughfare is the Strand Road, from which a rectangular plan of streets diverges eastward. The chief native building is the Shwesandau Pagoda, 180 feet high, surrounded by 83 small gilded temples. It is visited by thousands of Buddhist pilgrims on the occasion of each annual festival in March. The European buildings include the Government offices, Law Courts, the Jubilee Clock Tower, and the Anglican Church; the public gardens and the markets are also notable features. The town has many advantages for trade. In the adjacent country are extensive gardens and rice grounds, and there are important manufactures of paper, silk, cotton, sugar, and gold lacquer ware. Population, in 1891, 30,202; in 1901, 27,375. Prome dates from before the Christian Era, when it was the capital of a powerful kingdom. The town was taken by the British in 1825 and in 1852. In 1856 it was almost wholly destroyed by fire.

PROMESSI SPOSI, prô-mäs'sé spö'zè, I. (It., The Betrothed). A novel by Alessandro Manzoni (1825) so admirable that it has become a classic and has been translated into all languages. The story, laid in Milan in the seventeenth century, tells of two peasants, Renzo and Lucia, betrothed but refused marriage by their parish priest, incited by the outlaw Don Rodrigo. After many adventures and suffering during a plague, the novel ends happily for the lovers.

PROMETHEA (Neo-Lat., from Lat. *Prometheus*, name of a giant). One of the commonest of the large North American silkworm moths (*Callosamia Promethea*). The female is reddish brown with white, black, and gray markings. The wings of the male differ both in shape and coloration from those of the female, and are blackish, with the markings characteristic of the female very faint or wholly absent. The fully grown larva is two inches or more in length, bluish green, and armed by large black tubercles in addition to four coral red ones in the thoracic region and one yellow one on the abdomen. The larvæ feed preferably on the wild cherry and ash, but are also found on a great variety of trees and shrubs. The cocoon is elongated and inclosed in a leaf, which is attached to a twig by strands of silk and is thus prevented from falling in the autumn. Although the cocoon resembles very closely that of

the ailanthus silkworm (larva of *Philosamia cynthia*), which has some slight market value, it has never been commercially used.

PROMETHEUS (Lat., from Gk. Προμηθεύς, from προμηθής, *promēthēs*, foresighted, from πρό, before + μήτις, *mētis*, wisdom; connected with μαθεῖν, *matheîn*, to learn; less probably connected with Skt. *pramantha*, fire-drill, from *pra*, before + *mantha*, churning, from *math*, to whirl, churn, produce fire by friction). The hero of one of the most interesting of the Greek myths. The story goes back to a very early period, and in its origin may be compared with the many similar legends as to the origin of fire, usually by a theft from the sun or the gods, or the beneficent gift of some kindly animal or great hero. In this character as the fire-bringing god (ὁ πυρφόρος θεός, *ho pyrphoros theos*) Prometheus had an altar in the Academy at Athens, where he was joined with Hephaestus and Athena, as those who had given to men the arts and crafts that brought civilization. He was honored with a special festival, of which the chief feature was a torch-race from his altar in the Academy to the city. In Hesiod Prometheus is a Titan, son of Iapetus and Clymene, brother of Atlas, Menotius, and Epimetheus. Angry at a trick played on him by Prometheus, Zeus deprived men of fire, but Prometheus stole it from the hearth of Zeus, hid it in the pith of a fennel-stalk, and conveyed it to earth. In punishment Zeus sent Pandora (q.v.) to Epimetheus and bestowed thus upon men the race of women "who dwell as a great plague among mortal men." Prometheus himself was fettered to a column, and visited daily by an eagle who devoured his liver, which always grew again during the night, so that his torment was unceasing till Hercules came, and by the goodwill of Zeus, who thus gave greater glory to his son, slew the eagle and freed Prometheus. In this version the Titan really works men harm in his efforts to overcome by trickery the high designs of Zeus. It should also be noted that the myth of Pandora seems to be originally a separate legend of the origin of suffering and woe, only later connected with the theft of fire. This primitive myth was reworked by the Athenian tragedian Æschylus in his Promethean trilogy, of which the *Prometheus Bound* has survived, and was brought more into harmony with the Athenian cult and the conceptions of a later time. Here Prometheus is the son of Themis (whom the poet identifies with Gæa, the earth), and through her possesses the gift of foreknowledge and prophecy. He thus foresees the ultimate triumph of intelligence over brute force in the struggle between Zeus and the Titans, and consequently joins the winning side. When, however, Zeus, as the establisher of a rule of law and order, plans to replace the wretched race of men by a nobler order of beings, Prometheus in pity defeats this design by stealing fire and instructing men in all the useful arts, so that there now exists no ground for Zeus to remove them from the earth. For this rebellion Hephaestus is required to nail Prometheus to a lonely cliff in Scythia near the ocean. Here the extant play shows him still defiant, execrating the ingratitude and cruelty of Zeus, who can thus punish an ally whose only fault is a desire to benefit mankind, and at the same time exulting in the secret knowledge that the violence of Zeus to his father, Cronos, unless atoned for, must be pun-

ished. His threats and defiance rise to such a pitch that Zeus casts him into Tartarus.

The play seems to represent Prometheus as a martyr and Zeus as a cruel tyrant, but closer examination shows that Zeus is bound to punish the rebel who has tried to overthrow the new reign of law. The later dramas of the trilogy seem to have made this conception clear. Zeus was reconciled to Cronos and the Titans, and Prometheus was brought to yield to the now secure Zeus. Hercules by the will of the god slew the eagle and freed the prisoner, in whose stead the centaur Chiron, suffering from an incurable wound, surrendered his immortality and descended to the regions of the dead. The closing drama seems to have related the establishment of the worship of Prometheus at Athens. In the later versions, especially on the sarcophagi, besides minor variations, we find Prometheus represented as the actual creator of men, whom he fashions out of clay, and at whose death he is sunk in sorrow and meditation. The whole myth in its origin and signification, and especially in its treatment by Æschylus, has been the subject of lengthy discussion and has produced an extensive literature, much of which is to be found in editions of the play. Consult: Welcker, *Die Æschyläische Trilogie Prometheus*, and *Nachtrag* (Darmstadt, 1824, 1826); Hermann, "De Æschyli Prometheo Soluto," in his *Opuscula*, vol. iv. (Leipzig, 1831); these two works developed a great controversy and have historical interest. Consult also: Wecklein's *Prometheus Bound of Æschylus*, trans. by F. D. Allen (Boston, 1891); Preller-Robert, *Griechische Mythologie I.* (Leipzig, 1887). The play has been translated by Mrs. Browning. On works of art see: O. Jahn, "Prométhée," in *Annali dell' Istituto* 19 (Rome, 1847), and "Ueber ein Sarcophagrelief im Museo Borbonico," in *Berichte der sächsischen Gesellschaft der Wissenschaften* (Leipzig, 1849); Milehhöfer, *Die Befreiung des Prometheus. Berliner Winckelmannsprogramm*, 42 (Berlin, 1882); Baumeister, *Denkmäler des klassischen Altertums, s.v. Prometheus* (Munich, 1889).

PROMETHEUS UNBOUND. A lyrical drama by Percy Bysshe Shelley (1820). Though founded on Æschylus's tragedy, it is not Greek in form or spirit. Prometheus, the type of humanity, bears his tortures even with resignation, till the secret is revealed, and Jupiter falls. The Spirit of the Hours announces the release of the hero, and all nature joins in the chorus of redemption. In this poem Shelley (stirred by the spirit of the French Revolution) exults in the deliverance of humanity.

PROMISE. See CONTRACT.

PROMISSORY NOTE (from Lat. *promissor*, promiser, from *promittere*, to promise, send forward, from *pro*, before, for + *mittere*, to send, Skt. *mir*, to push). A written instrument containing an express and unconditional promise by the maker to pay a certain sum in money, on demand, or at a fixed or determinable future time. If it is payable to order or to bearer, it is a negotiable instrument (q.v.). The following is an ordinary form of a negotiable promissory note, payable at a bank:

"\$1000.00. New York, April 1, 1903.
Three months after date I promise to pay to the order of Richard Roe One Thousand Dollars, at the Corn Exchange Bank.

Value received, with interest. JOHN DOE."

Had the words "at the Corn Exchange Bank," been omitted, the note would have been payable at the maker's place of business or residence.

It will be observed that the parties to a promissory note are two—the maker and the payee. If the payee is named, as in the form given above, and the note is payable to his order, his indorsement of it is necessary to its negotiation. He may sell and transfer it, without an indorsement; but his transferee in that case will take it subject to any defenses available to the maker against him. The maker promises absolutely to pay the paper. Hence the holder is not bound to present it at the time and place named in the instrument, as a condition of suing the maker.

The early history of promissory notes is quite obscure. Their earliest appearance in the reported decisions of English courts is during the close of the seventeenth and the opening of the eighteenth century. For a time the judges seemed disposed to follow mercantile usage and to treat them as negotiable instruments. With the accession of Lord Holt to the chief justiceship of the King's Bench, a change of judicial attitude became noticeable. He refused to recognize their negotiable character; and in 1704 Parliament, siding with the merchants, enacted a statute (3 and 4 Anne, c. ix.) which declared that promissory notes "shall have the same effect as inland bills of exchange." In some of the United States this statute has been looked upon as simply declaratory of the common law, while in others Lord Holt's view has been accepted. Everywhere, however, certain forms of promissory notes are now deemed negotiable instruments.

In some States certain forms of notes are declared negotiable by statute which are not negotiable in the common-law sense. For further discussion, and for the liability of indorsers, requirements as to presentation, etc., see such titles as BILL OF EXCHANGE; DUE BILL; NEGOTIABLE INSTRUMENTS; INDORSEMENT; PROTEST; DEMAND, etc. Consult: Bigelow, *The law of Bills, Notes, and Cheques* (2d ed., Boston, 1900), and the authorities referred to under NEGOTIABLE INSTRUMENTS.

PRO'MORPHOL'OGY (from Gk. *πρό*, *pro*, before + *μορφή*, *morphē*, form + *-λογία*, *-logia*, account, from *λέγειν*, *legein*, to say). The study of the simplest of the fundamental forms of organisms. While the simplest plants and animals as well as eggs and seeds are, as the result of the action of gravity, more or less spherical, in other types we are reminded of the forms of crystals, though there is wanting the mathematical regularity and symmetry present in crystalline forms. In the most symmetrical animals certain internal organs are unsymmetrical in relation to the body. See SYMMETRY.

PROMOTER (ML. *promoter*, from Lat. *promovere*, to promote, push forward, from *pro*, before, for + *movere*, to move, Skt. *miv*, to push). One who urges or assists in the organization of corporations or joint-stock companies. A promoter commonly makes the plans for the business operations to be carried on, estimates the possible profits, solicits subscriptions to the stock of the proposed corporation, and, in short, does all he can to bring about its organization. A promoter is held to stand in a fiduciary relation to the

prospective company. Accordingly, he is held to a very strict accountability as to his motives and as to any profits he may endeavor to make out of the proposed organization. Unless he discloses to the subscribers for stock the amount of profits he intends to make by effecting the organization, or by selling the company any lands or things of value, he must account to them for what he receives. If a promoter makes fraudulent misrepresentations as to the prospects of the intended corporation, any subscriber deceived thereby may cancel his subscription, and may recover any damages he may sustain from the promoter. If a person urges others to form a company and buy something he has to sell, and does not himself become identified with the organization, he is not a promoter in the above sense, and may obtain the best price he can induce the company to pay for his property. A corporation, when organized, is not liable for any 'contracts' entered into on its behalf by the promoter prior to its organization. It cannot ratify them, but may 'adopt' them, but this amounts to making a new contract. A promoter may sometimes be held personally liable on such contracts. See Thompson, *On Liability of Directors and Other Officers and Agents of Corporations* (Saint Louis, 1880); and consult the authorities referred to under AGENCY; CONTRACT; CORPORATION.

PROMOTION. See RANK AND COMMAND.

PRONA'OS (Lat., from Gk. *πρόναος*, porch before a temple, from *πρό*, *pro*, before + *ναός*, *naos*, temple). The vestibule in front of the *naos* or *cella* of a temple. It is commonly a portico formed by prolonging the side walls of the cella.

PRONGHORN. The goat-antelope (*Antilocapra Americana*) of the plains of Western North America, generally known as 'antelope,' and by

HEAD OF A PRONGHORN.

Showing the early change from hairy skin to horn at the tips of the young horns.

the Canadian French as 'cabree' (*cabrit*). It ranged from the Missouri River to the Pacific coast and from the Saskatchewan River to the interior of Mexico, most commonly on open plains or in broad valleys. It is not nearly as abundant now as formerly, but it is still plentiful in the less thickly settled parts of the West.

The pronghorn is about 4½ feet long and three feet high. It is yellowish-brown above and white below; there are brown and white markings on the head, and the white buttocks are said to gleam in the sun at a long distance. The shape of the body is deer-like, but more

robust; the head is carried erect, while the bounding gait and alert air are gazelle-like. (See Colored Plate of ANTELOPES.) The animal differs from the true antelopes and from all other ruminants in the total absence of 'false hoofs,' and in the remarkable nature of its horns, which are deciduous. The skull is surmounted by two spike-like horn-cores, rising over the great eye-orbit and leaning outward. These are covered with a skin and coat of bristly hairs which agglutinate at the tip and change into a compressed horny sheath, the change proceeding toward the

SKULL OF A PRONGHORN.
Showing horn-cores and dentition.

base until the whole is sheathed with horn. These stand about a foot in height, are curved inward, often so as to be truly lyrate, and—unlike any other sheath-horn known—are branched, having one prong (occasionally more) on the anterior edge. Every winter these horns are pushed off by new hairy growths beneath them, comparable to the 'velvet' of deer's antlers, which in turn harden into another pair of true horns. This distinction is deemed sufficient to justify placing the pronghorn in a separate family, the Antilocapridæ, intermediate between the giraffes and the Bovidæ. The horns of the female are rudimentary. The pronghorn is provided with several glands which secrete strong-smelling substances, especially during the rutting season. The most notable of these glands are just below the ear, one on each side. In summer the hair of the pronghorn is smooth and flexible, but as winter approaches it lengthens; each hair becomes thick, its interior becomes white and spongy, and it loses its flexibility, at last becoming brittle, so that its point is easily rubbed off. This singular fur forms a close and warm covering for the animal, but renders the skin useless as fur, nor does it make serviceable leather. The flesh, however, is delicious.

The pronghorn is confined to the open plains and thinly wooded parks and valleys of the Western mountains. It is suspicious and timid, and liable to panic, when it will dance up and down; but when once away goes at a leaping pace which few greyhounds can outstrip. Early in spring the does separate from the winter herd and in some retired spot bring forth usually two kids. The does and kids soon gather into bands for mutual assistance in resisting their foes, and in the early autumn they are joined by the bucks, whose horns are new, and who engage in fierce

contests for the possession of the does. In former days these bands numbered thousands, and those in the northern districts regularly migrated to the southward when snow came. At the beginning of the present century the pronghorns had been so reduced and scattered that no herds of great number could gather.

Consult: Caton, *Antelope and Deer of America* (New York, 1877); Lydekker, *Royal Natural History*, vol. ii. (London, 1895); Canfield, *Proceedings of the Zoological Society* (London, 1866); and books on sport in the Western United States and Canada.

PRONOUN (Lat. *pronomen*, word standing in place of a noun, from *pro*, for, before + *nomen*, name, word, noun). In grammar (q.v.), a word which stands for or instead of a noun (q.v.). While the noun is at first concrete, the pronoun is abstract, and thus represents psychologically a much higher concept than the noun. That it is of later development than the noun seems clear from its composite or suppletive inflection, being made up of a number of stems, still seen, for instance, in *I, me, we, us*. It had originally no connection with the noun, from which it differed in inflection and in usage. At a later period, however, the nominal and pronominal systems of inflection (q.v.) influenced each other, so that the pronoun shows a number of terminations which properly belong only to the noun, and vice versa. A careful distinction must be observed between pronouns with gender and those without gender. To the former class originally belonged only the pronouns of the first and second persons and the reflexive pronoun of the third person (represented, for instance, by German *ich, du, sich*). All other pronouns had gender, which was probably natural, not grammatical in character. (See GENDER.) These pronouns are demonstrative (as Sanskrit *sa*, Greek *ὁ*, Latin *ille*, 'that,' later 'the'), from which the modern pronouns of the third person are derived (compare English *he, she, it* with Anglo-Saxon *hē, hēo, hit*); relative (as Sanskrit *ya*, Greek *ὅς*, Latin *quis*, English *who*), which are more intimately connected with the interrogatives than the demonstratives; and the interrogatives (as Sanskrit *ka*, Greek *τις*, Latin *quis*, English *who*). Of these classes the demonstrative, which is local in force, is probably the oldest. The relative, which introduces the relatively late sentence-form of hypotaxis or subordinate clauses as contrasted with the more primitive parataxis or coordination, seems to be the youngest. Between the two, yet nearer to the demonstrative in point of age, stands the interrogative, which introduces a question. Consult: Zimmer, *Vergleichende Grammatik der semitischen Sprachen* (Berlin, 1898); Brugmann, *Vergleichende Grammatik der indogermanischen Sprachen*, vol. ii. (Strassburg, 1892).

PRONUNCIATION OF FOREIGN NAMES (Lat. *pronunciatio, pronuntiatio*, from *pronunciare, pronuntiare*, to pronounce, proclaim, from *pro*, before, for + *nuntiare*, to announce, from *nuntius*, messenger). The correct pronunciation of a proper name chiefly depends upon giving to the letters their correct value and to the syllables their correct degree of stress. Most of the sounds in the modern foreign languages are fairly well represented by the ordinary sounds of spoken English, but there are some that are so distinct that a reasonably correct pronunciation involves

a sound or sounds quite distinct from any represented by any single letter in the English alphabet, and in some cases sounds not heard at all in spoken English.

If the same alphabet with the same letter values were used in all the modern languages and the spelling were phonetic, the correct pronunciation of most foreign names would give little difficulty to a person speaking English; but the values of letters in those languages that use the Roman alphabet vary so greatly from the English values that in fact little can be told of the pronunciation of a foreign name from its spelling by any general rule, except that the vowels probably have the values given to them in Italian. In the case of those languages (as Russian, Turkish, Arabic, Greek, etc.) that use an alphabet differing from the Roman alphabet a new difficulty is involved in understanding the foreign letters, or, if the name occurs spelled in Roman letters, in ascertaining what system of transliteration is used.

Another difficulty is involved in the fact that the names of many foreign countries, cities, and persons have come into English use through the medium of a third language, as through French or German, in which case the spelling is influenced accordingly. In many other cases the spelling that has come into English represents an attempt made by some explorer or traveler to represent some native pronunciation heard by him, as in the case of a number of Chinese names. Owing to these and other difficulties, no general rule can be given for the pronunciation of proper names in all or any number of foreign languages; and in any given language, however phonetic its system of spelling may be, there are many names that present variations from general rules.

The following rules or principles, therefore, are intended to furnish only a general rule to aid in understanding the values of the letters that occur in the names of foreign languages using the Roman alphabet, or essentially that one, and to some extent transliterations from other languages, as the Russian and Greek. For the purposes of this article the best practicable method will be to explain the sounds mentioned by reference to the same sound in the English language or its nearest equivalent, the more accurate and scientific method of describing by the conformation of the mouth organs when uttering the sound being too technical for this place. See the explanation of Visible Speech in the article DEAF MUTE, and also consult the titles A, B, C, etc., in this Encyclopedia.

Loosely, it may be said that each vowel in the foreign languages has a pronounced value, except that in cases of doubled letters two vowels generally make a single syllable. The number of syllables in foreign words is, therefore, generally equal to the number of vowels. In the respelling for pronunciation used in this work the syllables are separated from each other by accents (' for primary stress, and ' for secondary), and hyphens (-), with the use of the apostrophe (') to indicate a lesser degree of separation between consonants than is made by a full vowel constituting a distinct syllable, as in the glides (obscured transitional sounds) and catches (certain spasmodic interruptions of the breath). Every letter in a respelled pronunciation is to be given its value as indicated in

the key to pronunciation. In many cases in English words and names no pronunciation is indicated, either because the pronunciation has already been shown in a preceding word, or because its proper pronunciation seems too evident to need to be indicated. In some cases where the pronunciation of a word is sufficiently indicated by marking the accented syllable, the vocabulary title has been accented without respelling. In such cases it is assumed that the values of the letters are known or evident. In some foreign words, also, only the accented syllable is shown in the same way, in which cases the letters are to be given the values that they would naturally have in an English word spelt in the same way.

ACCENT. In nearly all languages words are pronounced with an accent, or distinguishing stress, upon one syllable or more. In most of the modern languages of civilized races this accent is essentially like that of English, especially in the Teutonic languages; but in none of the languages is the accent thrown upon the accented syllables so much to the exclusion of the others as is done in English. The unaccented syllables in foreign names, therefore, are generally more distinctly pronounced than in English, the vowels retaining the quality of the long accented vowels, but being cut off more quickly in utterance. Conversely the long or accented vowels in foreign names do not usually have the glides that often give the English its drawled effect to foreign ears. In speaking foreign names, therefore, care should always be taken to pronounce distinctly syllables not marked as indistinct or slurred in the respelling, and, on the other hand, not to prolong unduly the vowels of accented syllables.

There are few cases where any general rules of accentuation can be given that are not subject to numerous exceptions. Some, however, are sufficiently general to be of considerable aid in determining the proper pronunciation of foreign names.

In *Arabic* the stress is on the last long syllable, i.e. one having a long vowel, or a short vowel followed by a consonant, except that a final long vowel does not take the accent. If there be no long syllable the first syllable is accented. In *Bohemian (Czech)* the accent is on the first syllable. In *French* there is generally no strong accent, and by some it is said that there is no accent. Probably the best opinion, however, is that there is an accent on the last syllable of importance in conveying the meaning of the word, which in proper names would, naturally, be practically always the last syllable. In accordance with this the heavy accent has been uniformly placed upon the last syllable in giving the pronunciation of French names in this Encyclopedia. The accents printed as a part of French words do not relate to the spoken accent or stress. In *German* the accent is so generally in accordance with the principles of English accent that the sense of the reader may generally be trusted to get it right. In modern *Greek* the stress follows the written accent, and is not governed by the quantity of the vowels. In *Hungarian* the spoken accent is always on the first syllable, and graphic accents are used only to indicate long vowels, whose length is due to prolongation without added stress of voice. In *Italian* most names have the spoken accent on

the penult, or last syllable but one. In names from Latin having a short penult in the Latin the accent is usually on the antepenult in Italian. A graphic or printed accent on a word usually denotes the spoken accent, except when the acute accent occurs over the vowel *i* in the terminations *ia*, *io*, and in a few cases where an accent is used to distinguish words spelt alike, but having different meanings. In *Polish* the accent is usually on the penult. In *Portuguese* the accent is generally upon the last syllable, except in case of names ending in a vowel, when it is mostly on the penult. In *Russian* no rule exists that is sufficiently general to be worth stating. The accent must be determined in each case by itself. In *Spanish* the accent is generally on the penult in words ending in a vowel or in the consonant *n* or *s*, and in other cases it is usually on the last syllable. A graphic accent indicates stress, or spoken accent; and when a final syllable ending in a vowel or in *n* or *s* is accented, the best present usage (that of the Academy) is to place a graphic accent on that syllable, and in like manner when a word terminating in a consonant other than *n* or *s* has the accent on the penult that syllable bears the graphic accent. In *Turkish* the last syllable is generally lightly accented. In *Welsh* the accent is on the penult, except in a few cases where it is on the final syllable.

THE LETTERS—VOWELS AND CONSONANTS. It is impossible within the scope of this article to make any attempt at a complete statement of the values of the letters and their combinations, even in the languages of the modern civilized races. The following alphabetic list is intended only to afford a clue to answer those questions that are likely to be looked up in a general work of this character. The statements refer, of course, only to the modern foreign languages that use the Roman alphabet, except as otherwise noted above.

A generally has the value of *a* in English *far*, *bath*, *fast*, or sometimes one approaching the sound of *a* in English *cat*; in Hungarian *a* is nearly *o* in *hot*, and *á* as *a* in *far*; short *a* in Sanskrit and in many East Indian names is as *u* in *but*; *a* in French is nearly as *a* in *far*.

Á in Rumanian is as *i* in *tin*; in French nearly as *a* in *far*.

Ǽ or **Æ**. See **Æ**, below.

Ȧ in Rumanian resembles *e* in *her*.

Ȧ in Polish is like *a* in *fall* nasalized. See **X** below.

Ȧ in Portuguese. See **AM** below.

Ȧ in Swedish is like *a* in *all*, or sometimes resembling *o* in *obey*.

AA in Danish and Norwegian is like *a* in *all*, or sometimes resembling *o* in *obey*; in Dutch equals older **Æ**. See **Æ**, below.

Æ. In German *a e* (or *ä*) is nearly as *a* in *fate* or in *scute*, or as *e* in *set*; in Dutch *ae* (now spelt *aa*), and in Flemish *ae*, is like *a* in *far*; in Swedish *a e* (or *ä*) is like *e* in *set* or in *there*; in Danish and Norwegian *ae* is often like *a* in *sat*; in Welsh *ae* is somewhat like *i* in *ice*.

Ǽ in Portuguese is like *i* in *ice*, nasalized, or pronounced through the nose.

AI or **AJ** (when *j* is a vowel) is in most cases a proper diphthong, essentially like the sound of *aye*, 'yes.' It is often best represented by a 'long *i*' (*i* in this work). In French *ai* is nearly

as *a* in *fate*; in modern Greek as *e* in *set* or *a* in *senate*; in Hungarian *aj* is as *oi* in *boil*, and *aj* nearly as the sound of *aye*.

AIL, **ILL**, **AIM**, **AIN**, in French. See **IL**, **ILL**, etc., below. **AJ**. See **AI**, above.

AM, **AN**, in French and Portuguese, when final or preceding a consonant other than *m* or *n*, have the sound of *a* in *far*, nasalized. (See **X**, below.) In French *em* and *en*, and in Portuguese *ã*, have the same sound.

ÃO in Portuguese is as *ou* in *house*, nasalized.

AU generally is like *ou* in *house*. In French it is like *o* in *no*; in modern Greek (*au*), like *ar*, except before surd or mute consonants, when it is like *af*.

ÄU in German is like *oi* in *boil*.

AV in Danish is usually like **AU** (see above) before a consonant.

AW in Welsh is like *ou* in *house*.

AY is generally like **AL**. (See above.) When it precedes a vowel, however, the *y* is often treated as a consonant, as in French and Spanish, and the preceding *a* given its proper value.

B at the end of a word, and generally when followed by a consonant, is pronounced like *p* in German, Dutch, and the Slavic languages. In Spanish and modern Greek its sound is like *v* made with the lips alone, and not with the lips and teeth. It is often interchanged with *r*.

BH in East Indian names. See **H**, below.

c before *e*, *i*, or *y* in German is like *ts* (Ger. *z*); in French, Portuguese, and Catalan, like *s*; before *e* and *i* in Italian it is like *ch* in *church*; in (Castilian) Spanish, like *th* in *thin*, but in Spanish America and parts of Spain like *s* in *sun*; in Rumanian before *i* it is like *k*; in Welsh and Gaelic it is always like *k*; in the Slavic languages it is like *ts*.

ç is like *s* in *set*.

č in Bohemian, Croatian, Servian, and Bulgarian is like *ch* in *chin*.

ć in Polish is like *ch* in *chin*.

cc in Italian is like *t-ch*, as in *chit-chat*.

CH in Spanish, and generally in Sanskrit and East Indian names, is pronounced as in *chin*; in Italian and Catalan, like *k*; in German, with the same guttural sounds as *g* (see **G** below); in Polish, with a similar guttural sound; in French and in Portuguese, like *sh* in *shin* (except in some classical derivatives).

cs in Hungarian is as *ch* in *chin*.

cu in Spanish when followed by a vowel is like *qu* in *quick*, unless the *u* has the dieresis (*ü*) or is accented (*ú*).

cz in Polish is like *ch* in *chin*; in Hungarian, like *ts*.

D in German, Dutch, and the Slavic languages (Russian, Polish, etc.), when final, and generally when preceding a surd in the same syllable, is pronounced as *t*; in Spanish, modern Greek, and Danish when between two vowels or final it has a softened sound, usually stated to be like *h* in *then*; in Danish and Norwegian it is silent or mute after an *l* or *n* in the same syllable.

dd in Welsh is like *th* in *then*.

DH in East Indian names. See **H**, below.

DT is like *t* in *bit*.

DZ is like *j* in *jet*.

E is generally equivalent, or nearly so, to *a* in *savior* or *a* in *create*, to *e* in *set*, or to *e* in *there*. In most foreign words the long

sound of *e* does not have the glide that is heard in *â* in English, as in *day*; and care should be taken not to pronounce *â* with this glide when that character is used in the respelling of foreign words in this book. In indicating the pronunciation of French, the character *â* is used both for the short and long quantity of this sound.

In French final *e* unaccented is silent, and it is usually silent or is much obscured when it ends a syllable other than the last. It is also nearly silent in Portuguese when final. In Russian *e* is like *ye* in *yet* when it follows *d*, *t*, *l*, or *n*, or when it is at the beginning of a syllable. In modern Greek it has the values of *e* in *pet* and of *i* in *machine*.

É in French is like *a* in *savior*.

Ê and Ë in French are like *a* in *cerate* or *e* in *there*.

E in Polish is like *e* in *pet*, nasalized. See *N*, below.

É in Bohemian is like *ye* in *yet*.

EAU in French is like *o* in *no*. See *AU*, above.

EEUW in Dutch is like *a* in *fate* followed closely by (Dutch *ie*. See *w*, below. When the *w* is followed by an obscure *e* the *w* has a more consonantal sound.

EI in French is like *a* in *cerate*; in German, Dutch, and Welsh, like *i* in *ride*; and elsewhere it is generally a proper diphthong like *ay* in *fay*.

EIN in French = *IN*, below.

EN in French = *AN*, above; in Portuguese it is like *a* in *cerate*, nasalized. See *N*, below.

EU in French and Dutch is nearly *e* in *her*, and equivalent to *ö*, below; in German, like *oi* in *boil*; in modern Greek (representing *eu*), like *ev* before a vowel or sonant consonant, and like *ef* before a surd. EU is otherwise generally a diphthong composed of the sounds *â* and *œ*, more or less closely united.

G is as *g* in *go*, *get*, in all the European languages before *a*, *o*, or *u*; and also in German whenever initial or followed by a vowel or liquid in the same syllable; in Swedish before *â*, or final after a vowel, or before *e* or *i* when short (except in *ge*); in Polish, before *e* and *i*; in Hungarian always, except in *gy*. (See below.) Before *e*, *i*, or *y* in French (see *GE*, below), Spanish, Portuguese, Rumanian, and Swedish (also in Swedish before *â* or *ö* or after *l* or *r* at the end of a primitive word or syllable), it is equivalent to *j* (see *J*, below) in the same language; in modern Greek it is like *y* in *yes*. Before *e* or *i* in Italian it is like *j* in *jet*. In Dutch *g* regularly has the voiced sound of the German *ch* or final *g*. In German *g* also has a guttural sound, made between the back of the tongue and the soft palate, which may be voiced, as when medial after back vowels (*a*, *o*, *u*), or unvoiced, as when final after *a*, *o*, or *u*; and a fricative sound made between the hard palate and the tongue, which may be similarly voiced, as when medial after front vowels (*e*, *i*, *ö*, or *ü*), or unvoiced, as when final after *e*, *i*, *ö*, *ü*, or a consonant. (See the *Key to Pronunciation*). German *ch* is pronounced like *g* in these positions.

GI is like *g* in *game* in Italian and Rumanian; in Irish it is like *h*, more or less strongly aspirated.

GLI in Italian when followed by a vowel has the sound of *lli* in *million*; if no vowel follows, the usual sound of *i* (Italian) is also added.

GX in French and Italian is like *ni* in *union*. See *Ñ* and *NI*, below.

GU before *e*, *i*, or *y* is like *g* in *go* in French, unless followed by a consonant or *ê*, when the *u* has its usual value; likewise in Spanish, unless the dieresis is put upon the *u* (*ü*), when the *gu* is as *gw* in *Gwilt*, as it is also before *a*, *o*, or *u*; and in Portuguese. In Italian *gu* is like *gw* in *Gwilt* before all vowels.

GY in Hungarian has the value of *d* followed by consonant *y*.

II in French, Italian, Spanish, and Portuguese is silent, or nearly so, except as it is considered in the various combinations *ch*, *gh*, *lh*, *nh*, etc.; in German it is silent between two vowels in the same word, except when followed by *ei*; in East Indian words it is generally pronounced like *h* in *hat*, distinctly heard in all situations, as after *b*, *d*, *t*, etc.; final *h* is often pronounced in Arabic and Persian names, properly with a harshly aspirated sound not heard in English; in Swedish *h* is silent before *j*.

I is usually like *i* in *pique* or *i* in *hit*; and sometimes like *e* in *set*, as in *-ling*, *-ding*, in Danish names.

IE is like *ie* in *field* always when final in French, and when medial in German, and before *r* in Dutch; and often when final in German.

IEN in French is as *IN* (see below) preceded by consonant *y*.

IJ in Dutch is nearly as *i* in *ride*.

IL final and ILL medial in French are as *y* in *yet*, strongly pronounced when following a pronounced vowel, and elsewhere as *i* in *pique* followed by the *y* sound. Formerly the *l* was also heard, as in Eng. *million*, and this pronunciation is still adhered to by some.

IM, IN, in French is *a* as in *bat*, nasalized. See *N*, below.

J in German, Dutch (see *IJ*, above), Italian, Swedish, Norwegian, Danish, Hungarian, and Polish is like *y* in *yet*; in French, Portuguese, and Rumanian it is like *z* in *azure*; in Spanish, like a rough or strongly aspirated *h* (see *X* below); in the Philippine Islands it is often like *sh* in *shun*.

K in Swedish before *e*, *i*, *y*, *â*, or *ö* in the same primitive syllable is almost like *ch* in *church*.

KII in Oriental names is usually properly a harsh guttural aspirate; in Russian names, often like German *ch*; in East Indian names, like separate *k* and *h*. See *I*, above.

L in French is as in English *like*, except after *i* (see *IL*, *ILL*, above); in Polish it is like *LL* in Spanish. See below.

L in Polish resembles *l* in *like*, very strongly pronounced.

LII in Portuguese is like *LL* in Spanish. See below.

LL in Spanish is like the *l-y* sound heard in Eng. *million*. In colonial or dialectic Spanish the *l* sound is sometimes not heard. In Icelandic *ll* is like *dl* in *handlike*; in Welsh, as nearly as can be given in English equivalents, like *ihl* or *tl*.

LY in Hungarian is like Spanish *LL*. See above.

M and N are practically always as in English, except when used as a velar *n*, the *ng* sound following an ordinary nasalized vowel, or used merely to indicate by checking the escape of air through the mouth and forcing it strongly against the soft palate.

\tilde{n} in Spanish, ξ in Polish, and ξ in Bohemian, Bulgarian, Croatian, and Servian are like *ni* in *union*.

ng in German is always like *ng* in *singer*.

nh in Portuguese is like Spanish \tilde{n} . See above.

ny in Hungarian is like Spanish \tilde{n} . See above.

o is usually like *o* in *note*, *obey*, or *for*; but it frequently shades away from these sounds toward those of *o* in *not*, *a* in *far*, *a* in *cast*; but these variations, unless very pronounced, may be sufficiently well represented as the δ (see *Key to Pronunciation*) more or less slurred or clipped in pronunciation. *O* in Swedish has the sound of $\delta\delta$ in *boot* or *u* in *full* when final or constituting a syllable, and also in the syllables *-nord*, *-port* when final.

\acute{o} in Polish is as *u* in *rude* or in *full*.

\ddot{o} (or sometimes *oe*) has no equivalent in English, but resembles *e* in *her*, and is the same as French *eu*.

\hat{o} in French is as *o* in *no*.

o in Portuguese is *o* as in *no*, nasalized. See *M*, above.

OE is sometimes used for \ddot{o} (above), with the same value; in Dutch it is as *u* in *rude*, *full*; in Low German names, like *o* in *note*; in Welsh, somewhat like *oi* in *boil*.

\hat{oe} in Portuguese is like *oi* in *oil*, nasalized. See *M*, above.

\acute{eu} in French is like *EU* (above).

oi is usually nearly like *oi* in *boil*; but in French is regularly nearly like *wa* in *watch*; in modern Greek like *i* in *pique*.

oix in French is French *ix* (above) preceded by English *ic*.

oo is usually *o* as in *no*, *oh*.

ou in French and modern Greek is like *u* in *rude*, *full*; in Dutch and Norwegian like *ou* in *mouse*; in Portuguese, nearly as *o* in *no*.

ouw in Dutch is nearly as *ou* in *mouse*.

ow in Low German names is as *o* in *no*.

r is as in English.

qu in French always, and in Spanish and Portuguese before *e* or *i*, has the sound of *k*; in German it is like *kv*. Otherwise it is usually equal to *kw*, as in Spanish and Portuguese before *a*, *o*, or *u*, in Italian in all situations, etc.

qv in Swedish is equal to *kv*.

R is usually pronounced with much more trill than it has in English. A gutturalized *r* is also heard, as in some pronunciations of French and German, that has no equivalent in English.

\tilde{r} in Bohemian is like *r* followed by the sound of *z* in *azure*.

RZ in Polish is like the sound of *z* in *azure*.

s has the sound of *z* in *zinc*, or nearly so, in German when before a vowel and not preceded by a surd or liquid; in French, when between two vowels or when carried over to the following word. It has the sound of *sh* in *shine* in Hungarian; in Portuguese, when final or before a surd (except *s*); in German, before *p* or *t* (although the sound of *s* is also supported by good usage). It has the sound of *zh* (*z* in *azure*) in Portuguese before a sonant consonant. In Italian *s* before a vowel is sometimes like *s* and sometimes like *z*, depending on usage. Otherwise than as above noted, *s* is usually like *s* in *sin*, as always in Spanish, Dutch, and Swedish.

ξ in Bohemian, Bulgarian, Croatian, and Servian is like *sh* in *shun*.

s in Rumanian is like *sh* in *shun*; ξ is like *sh* followed by *t*, before *e* or *i*.

sc in Italian before *e* and *i* is like *sh* in *shun*.

sch in German is like *sh* in *shun*; in Italian and Rumanian, before *e* or *i*, like *sk* in *skin*; in Dutch before vowels, except obscure *e*, like *sg* (see below), otherwise like *s*.

sg in Dutch is *s* followed by the guttural *g* of Dutch, resembling *sk* in English.

sj in Dutch, Swedish, and Danish is like *sh* in *shun*.

sk is like *sh* in *shun* in Swedish and Norwegian before *e*, *i*, or *y*.

skj in Swedish and Norwegian is nearly as *sh* in *shun*.

ss in Hungarian is a strong *sh* in *shun*; but elsewhere usually indicates a surd *s*, single or doubled, as in German, Dutch, etc.; in Italian it is sometimes equal to *ss*, sometimes to *zz*.

ssz in Hungarian is a prolonged *s* sound.

stj in Swedish is nearly as *sh* in *shun*.

sz in Hungarian is as *s* in *sin*; in Polish as *sh* in *shun*.

T after *n* in modern Greek is as *d*.

τ in Rumanian is as *ts* in *pits*.

th in modern Greek (θ), Welsh, and Icelandic is like *th* in *thin*; otherwise like *t*, or *th* in *thyme*, in all the modern European languages.

tscu in German is as *ch* in *church*.

ty in Hungarian. See *Y*, below.

tz is as *ts* in *pits*.

U is usually as in *rule* (\ddot{u}) or *put* (\ddot{u}). In French and in open syllables in Dutch it sounds somewhat like *u* in *put*. The correct sound may be approximated by attempting to pronounce \ddot{e} with the lips in the position for pronouncing \ddot{o} . In Welsh *u* is like *i* in *machine*; in Rumanian it is usually silent when final.

\ddot{u} (sometimes printed *ue* in German and Turkish) is like *u* in French. See above.

UE, except when representing \ddot{u} , usually combines the sound of *u* and *e*, more or less closely joined in pronunciation.

UI in French is much like Eng. *ice* (but see *GU*, *QU*, above); in Dutch nearly as *oi* in *boil*.

UM, *UN*, in French are nearly as *e* in *her*, nasalized; in Portuguese as Portuguese *u*, nasalized. See *M*, above.

UU in Dutch is Dutch *u* prolonged.

UY in French is like *UI* (see above), except before a vowel, when it is like *UI* followed by *y* as in *you*.

v in German, Dutch, and the Slavic languages (Russian, Polish, etc.) is as *f* in *fin* when final in a word, or (usually) in a corresponding part of a compound; otherwise as *r* in *vine*.

w in German, Swedish, Norwegian, and Polish is like *v* in *vine*; in Dutch it is like a *w* made without rounding the lips; in Welsh it is usually as \ddot{o} in *food*.

x in modern Spanish is usually as *x* in *fox*; sometimes it is as *j* or *g*. (See *G*, above.) In colonial Spanish, especially Mexican, and in some dialects in Spain, it often is as *s* in *sin*. In Portuguese *x* has the sound of *sh* in English.

z is as *ts* in *hats* in German; in Swedish, Danish, and Norwegian, like *s* (see above); in Spanish like *th* in *thin*, but in American Spanish and in some dialects in Spain like *s* in *sin*; in Italian like *ts*, or *dz* (as in English *adze*) or sometimes nearly as the English *z*; in Portuguese, when final, like *sh* in *shun*. Otherwise it is

usually as *z* in *zinc*, as in Dutch, Polish, Hungarian, etc.

y is generally like *i* in *machine*. In Danish, Swedish, and Norwegian it is like French *u*; *ym* and *yn* in French are like *im* and *in*.

ż in Polish is as *z* in *azure*.

ž in Bohemian, Bulgarian, Croatian, and Serbian is like *z* in *azure*, or, when final, like *sh* in *ship*.

ź in Polish is a softened *z*, much like *z* (*zh*).

zs in Hungarian is like *z* in *azure*.

PRONY, *prô'ne*, GASPARD CLAIR FRANÇOIS MARIE RICHE, Baron de (1755-1839). A French engineer and mathematician, born at Chamelet and educated in the Ecole des Ponts et Chaussées. In 1785 he was put in charge of the restoration of the harbor of Dunkirk, and in 1794, after the completion of his great tables of logarithms to twenty-five decimal places, the first made under the metric system, he was named professor of mathematics at the Polytechnique. Four years afterwards he was appointed head of the Ecole des Ponts. Prony held office through the Empire and was connected with the great sanitary measures undertaken in the Pontine Marshes and along the valley of the Po. His more important works include: *Nouvelle architecture hydraulique* (1790-96); *Cours de mécanique* (1815); *Description des marais Pontins* (1823); and *Notice sur les grandes tables logarithmiques* (1824).

PRONYMPH (from Lat. *pro-*, before + *nympha*, Gk. *νύμφη*, *nymphē*, bride, nymph). A stage of development with certain dipterous insects which transform within the last larval skin. This last skin having hardened and contracted, the insect within it loses all apparent structure and becomes an accumulation of soft, creamy matter within a delicate membrane. This condition begins in the resting larva, and the surrounding membrane is probably the larval hypodermis. In this pronymph the organs gradually take shape until a true pupa, corresponding to that of a hymenopterous insect, is formed.

PROOF (OF. *proce*, *preuve*, Fr. *preuve*, from Lat. *proba*, proof, from *probare*, to test, examine). In the mechanical arts, a trial copy or impression. Thus, in the art of die-sinking, the impressions taken from the die from time to time as it is brought to a state of approximate completion are called proofs, as their purpose is to guide the artist. They are, of course, struck in metal of no great intrinsic value except in the case of the last state of the die, or what is expected to be the last, when a proof will be taken in the metal intended to be used. As, however, museums and private collectors compete with one another eagerly for the proof copies of coins, and still more eagerly for proofs of important medallions, it is not unusual to take a number of such impressions from the completed die. These are sometimes marked as proofs by having a peculiar characteristic. Thus, all modern coined money is saved from the attacks of those who clip or pare the edges of silver and gold pieces (which practice was a great abuse as late as the eighteenth century) by having raised letters around the edge, such as "Dieu protège la France," on some French coins of the Third Empire and the Republic, or else by having the edge fluted or reeded with little bars across it. These will be omitted in the proofs.

In the printing of books and periodicals, the

proofs used are of several different kinds, and these are described under the title PRINTING.

The most important use of the word in connection with the arts is the name given to trial impressions from an engraved wood block or plate. (See PRINT.) It is customary to take these proof impressions at different times as the plate approaches completion, and such impressions are called engravers' proofs, and, in spite of their showing an incomplete state of the plate, are sure to command high prices in the case of an engraving of any importance. The engravers' proofs, taken as the plate approaches completion, are extremely brilliant and effective, because they are taken one by one, by hand, and with great care; the same brilliancy is preserved in the earliest proofs which are printed off expressly for sale. These are often classified in some special way. It is customary in the case of a large and important engraving for the artist to etch upon the margin of the plate some very small design, as a head, a figure of a bird or beast, or even a sketched incident with two figures, and this little picture is printed with the large composition which occupies the greater part of the plate. Impressions so taken are called *remarque proofs*, and are recognized as being the earliest. The *remarque* being planed away or the plate cut down, the proofs next taken are known as artists' proofs. All this time the intended lettering on the edge of the plate, that is to say, the title of the picture and the name of the engraver, and of the artist of whose original work the engraving is a copy in so many cases, have not been added. Proofs made from the unlettered plate are called generally *proofs before the letter* or *proofs before any letter*. If, now, the names of the original artist, if any, and of the engraver are added just below the edge of the picture, proofs taken at this stage are called *proofs before the title*, or by some such name invented for the purpose. What is said here of the engraver's or artist's name does not refer to the appearance of any artist's signature within the boundaries of the picture itself; for in many etchings and similar works the signature is almost a part of the design. The proofs with open letters are those in which the large capital letters of the title are inserted, but left in outline. After these letters are completed, the ordinary prints are taken.

There are still to be noted the proofs of artistic engravings, which are never lettered on the margin, which are not intended to have any title, or any name of artist or publisher, or any number or letter whatever on the margin. A conscientious etcher is very careful in noting the number of editions printed from any plate thus unsigned. The plate may be changed after any given printing; new effects may be produced, worn lines strengthened.

From this it will be seen what is the real importance of first state and second state, and the like, in artistic engravings. (See ETCHING; LINE ENGRAVING; MEZZOTINT.) The first state is apt to be preferred, because there is certainty that the plate has not been worn at this stage of its existence. It may be, however, that the second state is preferred for many reasons. There are some of the *Liber Studiorum* in which the second state is admittedly finer. An impression on vellum of the second state of an etching

may be better than an impression on paper of the first state, because prints on vellum are carefully taken and because of the exceptional beauty of a print upon this particular material. Again, the first state may be only known from the second state or other subsequent states by some very slight and hardly noticeable modification.

PROOF. In law, the establishment of facts alleged in the pleadings in a judicial proceeding by competent legal evidence. It is, therefore, the result of evidence, as distinguished from the evidence itself. However, the words proof and evidence are frequently used as synonymous, even by the courts, and when this is done, proof means simply competent legal evidence, as distinguished from irrelevant and incompetent hearsay evidence. See EVIDENCE.

PROOF-READING. The reading of printers' proofs, for correction of errors in the type, or, by authors or editors, for final approval or alteration. Proof-readers are sometimes called *correctors of the press*, and their work *correction of the press*, especially in Great Britain. Of course, the assembling of types, one by one, from their boxes in the printer's case, or the striking of a corresponding number of keys in machine composition, is not done by the average worker without accidents, making errors that need correction; and the work, besides the mere technical minutiae, comprehends reproduction from handwriting that presents many points of perplexity. In fact, typographic composition is liable to error in more ways than any person not a printer could possibly imagine. Thus it may be seen that correction through proof-reading is a most important feature of the production of printed matter. In fact, sometimes the work done on proofs is one of the largest items of expense.

Special marks are universally used by printers in correcting proofs, and authors and editors will find advantage in knowing and using these marks, mainly because of their inherent simplicity. Absolute simplicity in indicating changes, however, is the only essential desideratum. If a desired change is shown on the margin of a proof so plainly that it cannot be misunderstood, its conformity or non-conformity to technicality is of no consequence. One method of marking a proof will almost surely fail, and that method is one that suggests itself instinctively to the novice. It is that of making changes within the bounds of the text, such as a line through an extra letter or word that should be taken out, or writing a comma or other point after a word, with no mark in the margin. Proofs have been so corrected, and great disappointment felt because the final result showed neglect of the corrections. In the words of a puzzled editor who was shown how to change a sentence: "Why, it's nothing but common sense!" Some of the words in the sentence were to remain, but they were to have a different position (they were to be 'transposed'), and it was thought that through some special technicality they must be preserved; but the advice was that the whole sentence be crossed out and the whole new one be written in, directly in line with the erasure. Markings for correction may be enumerated as follows:

(1) In ordering the removal of anything not desired, a novice might write a full direction, as "This is to be taken out;" but the proof-reader makes in the margin, opposite a crossed letter,

word, or words, the sign **3**, which is merely a specialized form of the initial letter of the word 'delete.' One way will secure the desired result as well as the other, but the second plainly shows its economy, which exemplifies that of all marks peculiar to proof-reading. Frequently a number of corrections must be made in the same line, and in this case the only really arbitrary mark is used, being a vertical stroke, placed after each marginal item, merely for separation. Some readers make such a stroke after each correction in the left-hand margin, but before those in the right-hand. It is better always to have it follow, as that practice becomes so instinctive as to free the mind from unnecessary formality, and so assists toward concentration of attention, which is the key to success.

(2) A wrong letter is corrected by making a stroke through it and writing the proper letter in the margin. Exact system in the arrangement of marginal items is very desirable. Thus, a line may contain a number of errors, and it is much easier for the compositor to trace the corrections if made in regular order, exactly in line with the corresponding faults. It is well worth while to cultivate the habit of using the margin on the left for corrections in the first half of the line, and that on the right for others; also to write the first one well out toward the left edge, and the first on the other side near the print. Some proof-readers make the first mark on the right distant from the print, and those for later positions nearer, thus undoubtedly causing loss of time to the correctors of the type, who have to trace out the correspondences.

(3) Change of place, whether of a letter, a word, or many words, is called transposition. Such change within a line is indicated by a line drawn above, below, or around the first letter, word, or words, and under or above those following, to a caret indicating the new place for the matter shifted, and by 'tr.' written in the margin. For transposing letters merely, it is much better to cross them and write the letters themselves in proper order, especially for machine composition. To transpose paragraphs, a line is made alongside the first and a connecting line to its new place, and 'tr.' is written opposite the first. Many write 'transfer,' but 'transpose' is the printers' word.

(4) For change of type, a line should be drawn under the text and 'rom.' written for substitution of roman instead of italic, 'ital.' for changing roman to italic, 'l.c.' for lower-case, 's.c.' or 's. caps' for small capitals, and 'c.' or 'caps' for capitals. For a single letter or two letters together it is economical to write the letters themselves in the margin, with one line underscoring for italic, two lines for small capitals, and three for capitals; but in changing a single letter it is better to write the letter itself, in its proper form, than to use the abbreviations indicating that form, because thus only one character is written instead of four or more. One line is sufficient in any case under the type that is to be removed. In manuscript one line of underscoring directs the use of italic; two, small capitals; and three, capitals.

(5) To correct type of wrong form—too heavy, too light, etc.—'w.f.' meaning 'wrong font' (type of a wrong kind), is written.

(6) A direction to leave unchanged anything that has been crossed is given by making dots

The work of Propertius falls into two classes: first, and by far the more important, love-elegies, and, second, poems of eulogy. Indeed, the great event of the poet's life, and the only one of real importance so far as his literary activity is concerned, was his love for a mistress, somewhat his senior, whom he celebrated as Cynthia, but whose real name, if we may believe Apuleius (q.v.), was Hostia. She was probably the sister of one Hostius, who is known only as the author of a lost epic entitled *Bellum Histricum*. In character she seems to have been light, fickle, vain, and mercenary, yet witty and beautiful. In his early youth the poet had had an ephemeral passion for a slave-girl whom he calls Lycinna, but after his acquaintance with Cynthia he appears to have been loyal to her for several years. At last, probably after some five years, there came a break in their union, although they seem to have been reconciled before her death. In the poems addressed to her Propertius appears at his best, although the letter of Arethuse to her husband, Lycotas, foreshadowing the *Heroides* of Ovid, has a ring of pathos rarely beautiful. The two dominant notes of his poetry are passion and erudition. Less perfect in technique than Horace, he is more real; less sincere than Catullus, he is more balanced and restrained. The poet with whom one involuntarily compares him is Tibullus, yet here one misses the delicate sentimentalism founded on real affection for Delia which Tibullus had, while the erudite touches of Propertius, which justly won him the epithet of 'the learned,' are happily far less evident in his fellow. The distinguishing characteristic of Propertius among Latin poets is this erudition, often carried with visible effort. As his models he took the Greek Alexandrine school of poetry, following especially Philetas and Callimachus, being himself called 'the Roman Callimachus.'

In comparison with his love poems his eulogistic verse is of slight interest. Urged by Mæcenas to write in epic strain, he pleaded his unsuitability to the task. The justice of his self-judgment is confirmed by his elegies on Vertumnus, Tarpeia, Hercules and Cæus, and Jupiter Feretrius, for all of which he probably drew his material chiefly from Varro (q.v.). Yet he treated also contemporary events in his poems on the battle of Actium and the deaths of Cornelia and Marcellus, and the preparations of Augustus against the Parthians.

The first book of the elegies was published by Propertius, probably about 28, under the name of Cynthia. Although the dates of the remaining books are somewhat uncertain, the second and third seem to have appeared about 26, the fourth about 21, and the fifth about 16. The very number of the books is a disputed question. They were supposed to be three until the edition of Lachmann (q.v.), who divided the second book into two. Despite the arguments in favor of such a division, there are objections which may be alleged against it.

The manuscripts of Propertius are very late and extremely corrupt. His works were apparently unknown throughout the Middle Ages, the earliest mention of a manuscript of them being one in the possession of Petrarch. The best is the *Codex Neapolitanus*, dating from the twelfth or thirteenth century, and now in the library of Wolfenbüttel. The influence of the poet on literature has been slight, although it is noteworthy

that he inspired Goethe to the composition of his *Römische Elegien*.

The first edition of Propertius was published at Venice, in 1472. Other important old editions were by Scaliger (Paris, 1577); Passerat (ib., 1608); Broukhus (Amsterdam, 1727); Vulpi (Padua, 1755); and Burmann (Utrecht, 1780). The editions of Lachmann (Leipzig, 1816; Berlin, 1829) were epoch-making in Propertian criticism. Other editions have been published by Jacob (Leipzig, 1827); Hertzberg (Halle, 1843-45); Paley (London, 1872); Bährens (Leipzig, 1880); Palmer (Dublin, 1880); Postgate (London, 1881) and the text only by Keil (Leipzig, 1850); Haupt (5th ed., ib., 1885); and Müller (ib., 1870). English translations have been made by Cranstoun (London, 1875) and Moore (Oxford, 1870). Consult also: Jacob, *Propertius* (Lübeck 1847); Plessis, *Études sur Propertius et ses élégies* (Paris, 1886); Davies, *Catullus, Tibullus, and Propertius* (London, 1876).

PROPERTY (OF. *properte*, from Lat. *proprietas*, property, peculiar nature or quality, from *proprius*, peculiar to one's self), LAW OF. In the broadest sense (which is also in English the ordinary sense), property includes all rights that are primarily economic in their object—all rights that constitute legally protected wealth. It thus includes all rights in corporeal things, whether immovable or movable; all rights to demand from particular persons (debtors) acts or omissions that are primarily of economic value; and all monopolies, such as patent rights, copy-rights, franchises, etc. Excluded in modern law are the rights of a public officer or of a citizen, and the rights of a husband or father or guardian over the person of a wife or child or ward; because, although these rights may have economic value, modern law does not regard them primarily from this point of view. Modern theory, indeed, regards all public and family relations rather from the point of view of duties than from that of rights (q.v.).

EARLY LAW does not draw these distinctions; all early private rights are, in a broad sense, property rights. Our Aryan ancestors apparently used the same word (Ger. *mund*, Lat. *manus*, the hand) to indicate legal power over inanimate things, animals, slaves, delinquent debtors, wives, and children; and it is probable that the powers of owners, masters, creditors, husbands, and fathers were originally equally unlimited. (Cf. MARRIAGE; PARENT AND CHILD.) In early German law the same word (*mund*) was applied to the power of the King; and throughout the Middle Ages governmental powers were generally treated as property rights. Survivals of these early views are found in the English common law; e.g. in the description of an office as an 'incorporeal hereditament' and in the treatment of paternal right as a right to services.

ROMAN LAW sharply distinguished public from private law and political from property rights. The Roman law of property, however, originally included family rights. The earliest classification of property, which appears in the XII. Tables, is (1) *familia*, the household, which includes land and agricultural easements, beasts of draught and burden, slaves, wife and children; and (2) *pecunia* (from *pecus*, a herd), which includes all other things. Since things of *familia* were capable of conveyance only through a formal

sale before witnesses, known as mancipation, they were also termed *res mancipi*, and the things of *pecunia* were termed *res nec mancipi*. In early Roman law these two classes of property seem to have been protected by different remedies and to have been governed by different rules as regards testamentary disposition. In the later law, as modified by the prætors, the distinction lost all practical importance. In the later jurisprudence, family rights were taken out of the category of property (*res*) and put under the law of persons.

It is probable that the debtor was originally regarded as a *res mancipi*; but with the disappearance of the pledge of the debtor's person in the form of sale (*nezum*), rights against debtors (obligations, q.v.) were sharply distinguished from rights over things.

The Roman law also developed a clear distinction between ownership and all other rights in things. (1) Ownership (*proprietas*) included all powers that were neither specifically withheld by the law, in the interest of the community, nor specifically granted by the owner to another person. Ownership was thus at once the general and the residuary right over things. (2) All other rights (*jura in re*) were limited either in content or in duration. These limited rights were either (a) rights of use, viz. servitudes (q.v.) and long leaseholds (*emphyteusis* and *superficies*, q.v.), or (b) rights of eventual sale, created to secure debts, viz. pledge (*pignus*, q.v.) and hypothecation (q.v.). Except as regards the real servitudes and the leaseholds, these rights could be established either over immovables or movables; and substantially the same rules were applied to both classes of property. With rare exceptions, right in things could be freely alienated, and unless restricted to the single life, they were subject to free testamentary disposition. Finally all rights in things run against all the world, title prevailing over possession.

EARLY GERMAN AND MEDIEVAL EUROPEAN LAW. German law drew a sharp distinction between real property (*eigen*) and movable property (*gut*), and the distinction was emphasized by the development of the feudal land-tenures. Different kinds or classes of ownership were recognized as regards real property: the right of a feoffor was described as 'over-ownership' or *dominium emicnens*; the right of the feoffee in possession was described as 'under-ownership' or 'beneficial ownership'—*dominium utile*. A leasehold of a permanent character, such as was frequently held by peasants, was also described as *dominium utile*. At German law the owner of land had not free power of alienation; inherited land, at least, was treated as family property, and was 'tied up' (*verfangen*) in the interest of wife and children. In some territories kinsmen and even neighbors had rights of preëmption. Further restrictions upon alienation came with the development of the feudal tenures. In spite of these restrictions, however, lawful seisin of land was a right resembling Roman ownership, since it was enforceable even against honest possessors.

MODERN CIVIL CODES. In the law of real property, the disappearance of feudal tenures and the conversion of peasant holdings either into ordinary leaseholds or into freeholds has practically reëstablished the simpler Roman categories. Political power has been separated anew from property right, and there is no eminent do-

main except that of the State. On the other hand, the general introduction of official registration of conveyances, mortgages, etc., and the disposition to protect the honest purchaser who relies upon the public records have greatly modified the Roman rules. The registered conveyee or mortgagee is always protected against the holders of unregistered titles, and in modern German law there is, properly speaking, no title without registration.

As to movable property, nearly all the European legislations have accepted the old German rule that honest possession is good title except against a prior possessor by whom the thing was lost or from whom it was stolen; and even in the case of lost or stolen property, the possessor who has purchased the thing "at a fair, in a market, at a public sale, or from a merchant who deals in such articles" is not obliged to surrender it until the price which he paid for it is refunded. In the modern German code the rule is somewhat different: purchase in market overt does not protect the possessor of lost or stolen things, but purchase at a public auction gives him an unassailable title. In the German code, also, the honest possessor of money or of negotiable papers payable to bearer is always owner, and similar rules are contained in the commercial codes of several other countries. It follows from these rules regarding movable property that no hypothecation of such property is recognized, but only pledge accompanied by possession (*gage*, *Faustpfand*).

The principle which underlies all these modern rules is that of 'publicity.' Rights which run against all the world must be evident to, or at least ascertainable by, all the world. This end is gained, as regards real property, by registration of titles. As regards movable property the only public evidence of title is possession.

ENGLISH AND AMERICAN LAW. The common law of property has departed widely from the conceptions of the civil law, owing mainly to the independent development of the law of land under the influence of the feudal system. That system was late in establishing itself on English soil, but once established it impressed itself rapidly and permanently on the law of property. The fundamental distinction between movables and immovables disappeared, and we have, in their place, real and personal property, based on the distinction between real and personal forms of action. The real action was available to recover the very thing (*res*) of which the person instituting it had been deprived—primarily land and its fixtures. The personal action was instituted to recover damages from the person whose detention or destruction of a chattel had rendered him amenable to legal process. The two categories thus formed were swelled by circumstances, by analogy, by considerations of convenience, resulting in a curious composite. To real property were added all the so-called incorporeal interests, whether they had to do with land or not—as easements, profits *à prendre*, rents, tithes, offices. So, too, as real property passed by descent to the heir of a decedent, everything which by local or general custom passed to an heir and not to an executor came to be included in the description of real property—such as the crown, jewels, heirlooms, titles of honor. On the other hand, certain interests in land, as leaseholds, creditors' estates, mortgages, and shares in landholding corpora-

tions, came into the classification of personal property, for the contrary reason that upon the death of the holder they passed not to his heir, but to a personal representative.

But this grouping of property relations was only indirectly and somewhat obscurely determined by the feudal system. Its direct effect was to create a wide and permanent separation between the two systems. This it did by its transformation of real property through the doctrine of tenures. Personal property was left, as in other legal systems, subject to ownership in the full sense of that term. But real property could only be 'held' of some one else and in subordination to the rights of a superior holder. We have, therefore, land-holders, not land-owners. The distinction is of fundamental and far-reaching importance. The only owner of land is the king, the State. The subject can have at most an estate in it, i.e. a *status* with reference to it. The greatest estate possible—the pure fee simple absolute—is less than complete ownership, being a derivative and subordinate right, subject to the superior claims of him—whether a private person or the State—of whom the land is held. Property in land, therefore, is not the land itself, but an estate of longer or shorter duration in the land, together with certain rights of use and enjoyment. These rights depend upon the nature of the estate, whether for life, in fee tail, or in fee simple, and are originally curiously limited, even in such vital matters as alienation and inheritance, by the claims of the superior lord. These feudal restrictions have disappeared with the system which gave them birth, and in recent years the principle of estates has, in a limited form, been extended to personal property, but land is still held of the State, while personal property owes no duty to any one but the owner. See ESTATE; FEE; FEUDAL TENURE.

There is a further refinement in the common-law conception of property to be noticed in order to make our understanding of it complete. There may be rights not amounting to full ownership and yet recognized as property rights and legally protected as such. Just as, in the law of real property, several persons may have estates in the same parcel of land—one for years, another for life, another in fee, and so on—so also may a chattel be subject to a divided ownership. The faint line which divides a rightful possession from ownership has been traced in the article on POSSESSION. It appears most plainly in our law in the doctrine of pledge. The pledger of a chattel does not lose his property therein; but the pledgee gains something more than a mere right of detainer. He also has a 'property' in the article pledged, distinguished as a 'special' property, the pledger or owner (if we may still call him so) having the 'general' property therein. Property is thus, like ownership in Blackstone's famous passage, a complex of rights, all of which may be united in one and the same individual, or which may be divided up among several persons.

In very much the same way may the numerous and important rights in another's land (*jura in re, aliena*), such as easements, profits, and the like, may be regarded. Though falling far short of ownership of the land affected by them, they are true property rights, being protected from disturbance by any person whatsoever and not only against the owner of the land.

Here, then, we reach the outermost limits of

property rights. Other rights there are affecting land or goods which do not attain to the dignity of property. Of this nature is the right of the disseiser who is shut out of his land by an adverse possession, the right of entry for condition broken, the right to enforce a covenant running with the land, and the extensive class of rights known as equitable easements. These are all 'mere rights,' as the common law designates them, rights *in personam*, available against a specific individual, and not property rights, which are, strictly speaking, always rights *in rem*, asserted in the face of the whole world and capable of being infringed by any one who chooses to take the consequences.

The classification of property as *corporeal* and *incorporeal* is also peculiar to our legal system. Of course it has no rational basis. All rights are incorporeal, i.e. intangible, and the things which are the subject-matter of property rights are usually tangible corporeal things. It may, indeed, be admitted that such property as advowsons, tithes, offices, and the like, as well as the more modern forms of property denoted by the terms patent rights and copyrights, are incorporeal in the strictest sense of the term. But in Blackstone's use of the expression it includes easements, commons, and other profits *à prendre*, and all future estates in land, as reversions and remainders. Thus the estate of a tenant for life or years is corporeal property, whereas that of the landlord, being for the time dissociated from the possession of the land itself, is described as incorporeal. But the classification was only a convenient expression for such interests in real property as 'lay in livery' (i.e. were susceptible of physical control and therefore of delivery) and such as 'lay in grant' and could be transferred only by deed and not by livery of seisin. It did not, therefore, aim at philosophic completeness and has never been extended so as to include personal property.

Only the most important of the incidents of property can here be referred to. Where ownership is absolute and undivided, the right to use and enjoy one's own, whether real or personal property, is limited only by the rule that requires a man to use his property in such ways as not to injure his neighbor. Where the ownership is divided, however, the right of enjoyment is hedged about with numerous and complicated restrictions and there is law of waste and of trover to protect the owner who is out of possession. Though now bound up with the very conception of property, the unlimited rights of alienation and of inheritance have not always been recognized by our law, even with respect to personal property. In the case of real property, particularly, those rights, now complete, were wrested with difficulty and only after many years of effort from the feudal system. The right to transmit lands by will was only conceded by Parliament in 32 Hen. VIII. (1527). For other incidents of property, see EMBLEMENT; FIXTURES; WASTE. For modes of acquiring property, see ACCESSION; ALIENATION; CONVEYANCE; DISTRIBUTION; GRANT; INHERITANCE; OCCUPANCY; WILL.

The authorities are numerous. Consult especially Blackstone, *Commentaries on the Laws of England*; Leake, *Digest of the Law of Property in Land* (London, 1874); Williams, *Real Property* (19th ed., London, 1900); Williams, *personal Property* (15th ed., London, 1900); Schouler,

Personal Property; Pollock and Maitland, *History of English Law* (2d ed., Boston and London, 1899); Pollock and Wright, *Essay on Possession in the Common Law* (Oxford, Eng., 1888); Raleigh, *Outline of the Law of Property* (Oxford, 1890); Holland, *Jurisprudence* (9th ed., London and New York, 1900).

PROPERTY, or **PROPRIMUM** (in logic). See **PREDICABLES**.

PROPHECY (OF. *prophécie*, *prophetic*, Fr. *prophétie*, from Lat. *prophetia*, from Gk. *προφήτεία*, *prophēteia*, prediction, from *προφήτεω*, *prophēteuō*, to predict, from *προφήτης*, *prophētēs*, prophet, from *προφάναι*, *prophānai*, to say before, from *πρό*, *pro*, before + *φάναι*, *phānai*, to say). According to the popular acception, prophecy is essentially prediction, a foretelling of events by divinely inspired personages. Inasmuch, however, as the general ideas on the subject are based upon religious phenomena in Hebrew history, it is but proper, in order to determine the exact force of the term and its development, to turn to Hebrew usage. Adopting this method, we find the earlier terms in Hebrew for prophet (e.g. *rō'eh*, 'seer,' *khōzeh*, 'one who has a vision') associated with the prognostication of the future, and there is no reason to differentiate Hebrew prophecy in this stage from the belief common to all peoples in a low state of culture which assigns to certain individuals the power of ascertaining the will of the gods in whose hands the future of an individual or of a community lies. Such beliefs were common among Semites closely affiliated with the Hebrews. In Babylonia we find soothsayers, sorcerers, witches, and magicians recognized as necessary elements of society, and various classes of omen-priests connected with the Babylonian temples; *kāhin*, the Arabic equivalent of the Hebrew word for priest (*kōhēn*), is used to designate the 'soothsayer.' The various classes of soothsayers enumerated in Deut. xviii. 9-14 show not only the prevalence of this belief among the Hebrews up to a comparatively late period, but also the power which the soothsayers continued to exercise even after the period when the Hebrews entered upon a line of religious development destined to mark them off sharply from their fellow Semites.

The Hebrew 'prophet' accordingly traces his origin back to the 'seer,' that is, to the magician, sorcerer, and soothsayer; if he stands out in history as a personage distinct from the 'seer,' it is because there is afterwards added in his case a quality of a higher order. It is not difficult to determine what this quality is. In the proper historical sense, the term 'prophet' is applicable only to the series of teachers and exhorters who arose among the Hebrews in the eighth century B.C., and through whose influence a new conception of Deity and of the relation of the national god Yahweh to his people was evolved. While also concerned with 'prophecy' in the sense of foretelling the future, they dealt not with individuals, but with the nation as a whole or with the two sections of the people—the northern Kingdom of Israel, and the southern Kingdom of Judah. More than this, the prophetic functions which they exercised, or claimed to exercise, were incidental to their main task, which was to impress upon the people the sense of responsibility for their acts to a Deity, who governed, not by caprice, but by high standards of right, purity, and justice, and who was there-

fore to be approached, not by gifts and sacrifices, but by a contrite heart and a genuine spirit of devotion. The prognostications indulged in by those prophets of whose utterances we possess fragments in the 'prophetic' division of the Old Testament are largely concerned with threats of divine punishment for disobedience to Yahweh's will and decrees. They are accordingly based upon the profound conviction of the prophet that wrongdoing is certain to be punished; and in this respect their prophecies differ essentially from the attempts of soothsayers and diviners to determine by means of omens and oracular devices the course that will be taken by events and to ascertain the will of the gods.

This view of the prophetic calling among the Hebrews applies to the prophets from Amos to the anonymous Malachi, including therefore the brilliant galaxy Isaiah, Jeremiah, and Ezekiel. At the same time it must be acknowledged that, even in the case of these exhorters, survivals of the more primitive prophetic functions are to be discerned. While discarding the oracular methods of the soothsayers, they yet stand forth as interpreting certain signs and symbols in connection with Yahweh's purposes, and above all they claim, or are represented as claiming, to have had visions in which the future—generally of the nation—was revealed to them. No doubt it was this claim and the belief in their extraordinary powers that lent them a large measure of the influence that they exerted. And it is not necessary to assume that the prophets of the higher order no longer believed in the supernatural phases of their calling. They deeply felt that they were speaking in Yahweh's name and they were essentially the children of their day in accepting the position that Yahweh made his will known to his people through certain individuals singled out for the purpose.

The importance, therefore, of the Hebrew prophets consists in their paving the way for a new and far higher conception of prophecy, which, becoming in time more and more dissociated with mere foretelling propensities, made the prophet the moral and religious teacher *par excellence*. The highest expression of prophecy in this sense is to be seen in the announcement of a glorious age when with the complete reconciliation of Yahweh with his people a new period is to be ushered in, marked by the triumph of right and justice, and when the worship of Yahweh will be freed from all impurities and unworthy features. That this new era was closely bound up with strictly national ideals represents a natural limitation, the absence of which would have placed both the prophets and prophecy entirely beyond the intellectual and religious horizon of their times. As late as the advent of Jesus, the Messianic period (as the new era was designated) was bound up in the minds of the masses with the restoration of the Jewish Kingdom, and though Yahweh long ere the days of Jesus had ceased to be a merely national deity, yet even the God recognized as supreme and single in the universe was bound by special ties to a particular people; and even when the Messiah was no longer pictured as an earthly king, the limitation of Hebrew prophecy appears in the position accorded to Jerusalem, which, as the chosen seat of the universal God, was to be the spiritual centre of mankind—the gathering place to which all nations would make pilgrimage.

The view of prophecy above unfolded makes it doubtful whether the term prophet is applicable to such personages as Elijah and Elisha, or even to Samuel and Moses. That in the Old Testament the name *nābī'* is distinctly applied to them is simply due to that projection of later conditions into the remote past which is a distinguishing feature of the theory controlling historical compilation in the Old Testament collection. According to this theory, the religious views and ideas of the later prophets are but special expressions of a faith first promulgated by Abraham and given a definite shape by Moses. As a matter of fact the historical rôle of Moses and Samuel, so far as this can be determined, was so essentially different from that of the prophets from the eighth century on, that it is only a source of confusion to apply the term *nābī'* to those who flourished before the beginning of the religious movement that takes its rise with Amos. Elijah and Elisha are in a measure forerunners of this movement, but the religious problem in their days, involving mainly the conflict between the Yahweh cult and the Canaanitish Baal cults, is so entirely different from the one encountered when we come to the prophets in the real sense that we ought likewise to avoid the extension of *nābī'* to individuals of whom Elijah and Elisha are types; or, if the term 'prophet' is to be extended to them, it should at least be recognized that they are prophets of a totally different character, standing far closer to the old Semitic *kāhins*, who, more or less closely organized into a guild, differ from the ordinary representatives of the gods—the priests—only in not being attached to any particular sanctuary, but, passing from place to place, furnish oracles to those who seek them out, and engage in religious practices that are the outcome of primitive religious beliefs.

BIBLIOGRAPHY. Out of the large mass of literature following works are selected: Smith, *The Prophets of Israel* (London, 1882); Kuenen, *The Prophets of Israel* (Eng. trans., London, 1877); Duhm, *Die Theologie der Propheten* (Bonn, 1875); Ewald, *The Prophets of the Old Testament* (Eng. trans., London, 1875); Kittel, *Prophetie und Weissagung* (Freiburg, 1899); Riehm, *Die Messianische Weissagung* (2d ed., Gotha, 1885; Eng. trans., Edinburgh, 1891); Cornill, *Der israelitische Prophetismus* (Strassburg, 1894; Eng. trans., Chicago, 1897); Darmesteter, "The Prophets of Israel," in *Selected Essays* (Boston, 1895); Briggs, *Messianic Prophecy* (New York, 1886); and the Old Testament theologies of Dillmann, Smend, Oehler, and Schultz. See ELIJAH; ELISHA; MOSES; SAMUEL; and the articles on the different prophets of the Old Testament and their books.

PRO'POLIS (Lat., from Gk. *πρόπολις*, bee glue, suburbs, from *πρό*, *pro*, before + *πόλις*, *polis*, city). A substance commonly known as 'bee glue,' which is obtained by the domestic honey-bee from the buds and crevices of trees, and is carried by the workers to the hive in the basket-like cavities on the tibial joints of the hind legs. It is resinous in its chemical composition, and differs with the tree from which it is collected. It is used at once to stop up crevices in the hives, and to varnish the whole interior surface as well as to glue movable portions fast; also in strengthening the attachments of combs, and if the latter are designed exclusively for honey the

edges of the completed cells receive a thin coating. The flight-hole is often made smaller by filling a part of it with masses of propolis, sometimes mixed with old wax. Bees of the Carniolan race gather the smallest quantities of propolis and those of the Tunisian race the greatest amount; on this account the former are better suited to the production of white-comb honey.

PROPONTIS. The ancient name of the Sea of Marmora. See MARMORA, SEA OF.

PROPORTION (Lat. *proportio*, proportion, symmetry, analogy, from *pro*, before, for + *portio*, share; connected with *pars*, part). In mathematics, and equality of ratios. Thus the ratio of 12 to 3 equals the ratio of 8 to 2; hence 12:3=8:2 is a proportion. In general if $a:b=c:d$, a , b , c , d are said to be in proportion. An equality of several ratios, as 1:2=4:8=9:18, is called a *continued* proportion. An equality between the products of ratios, as $\frac{2}{3} \cdot \frac{5}{7} = \frac{10}{21}$, is called a *compound* proportion. In the proportion $a:b=c:d$, a , b , c , d are called the *terms*, a and d the *extremes*, and b and c the *means*. The term d is called the fourth proportional to a , b , c . In the proportion $a:b=b:c$, b is called the mean proportional between a and c , and c is called the third proportional to a and b . If one quantity varies directly as another, the two are said to be *directly* proportional, or simply proportional. E.g. the price of a given quality of sugar varies directly as the weight; the price is then proportional to the weight. Thus at 4 cents a pound, 12 pounds cost 48 cents, and 4 cents : 48 cents = 1 pound : 12 pounds. If one quantity varies inversely as another, the two are said to be *inversely* proportional. E.g. in general, the temperature being constant, the volume of a gas varies inversely as the pressure, and the volume is therefore said to be inversely proportional to the pressure.

A proportion, being an equation, can be solved so as to express any term by means of the other three. Some of the fundamental properties of proportion are: (1) The product of the extremes equals the product of the means; (2) the terms are in proportion by composition, i.e. if $a:b=c:d$, $(a+b):a=(c+d):c$ or $(a+b):b=(c+d):d$; (3) the terms are in proportion by division, i.e. if $a:b=c:d$, $(a-b):a=(c-d):c$ or $(a-b):b=(c-d):d$; (4) the terms are in proportion by composition and division, i.e. if $a:b=c:d$, $(a+b):(a-b)=(c+d):(c-d)$; (5) in a continued proportion,

$$\frac{a}{b} = \frac{c}{d} = \frac{e}{f} = k, k = \frac{\left\{ \begin{array}{l} ma^n + pc^n + qe^n + \dots \\ mb^n + pd^n + qf^n + \dots \end{array} \right\}^{\frac{1}{n}}}{\left\{ \begin{array}{l} mb^n + pd^n + qf^n + \dots \end{array} \right\}^{\frac{1}{n}}}$$

The theory of proportion, often called the 'rule of three' or 'golden rule,' is as old as Plato's time and was called by the Greeks *ἀναλογία*. Euclid in the fifth, eighth, and ninth books of the *Elements* gives a rigorous treatment of the subject, in which the magnitudes are regarded as either commensurable or incommensurable. See RATIO.

PROPORTION IN FINE ART. This has to do with the relative sizes of things represented or embodied in a design; and, in a secondary sense, with the relative importance of certain passages of light and dark, or of color more or less powerful and effective. Thus, the composition (q.v.) may be marred by a disagreeable relation between the heights or the bulks of two figures, trees, rocks, buildings in a picture or in

reality, or parts of a building, in which case they are said to be 'out of proportion.' So in an ordinary house front, as on the street of a city, the proportion between the window openings and spaces between them, and between the window openings of one tier and those of other tiers, and between the cornice and the wall below and between the stone-faced basement and the brick-faced wall between the basement and the cornice, may all be so judicious that the whole front becomes, by the combination of these different proportions, a remarkable work of art. Certain architects of great fame have had no other important claim to the consideration of posterity than a mastery of such proportions as these.

There is no fixed rule for proportion, nor even any body of rules for the government of those who would produce effective proportions in their design. It is true, however, that many attempted analyses have been made of fine designs, both in painting and in architecture, with a view of ascertaining the supposed principles which govern the designer in making admittedly beautiful compositions. For proportion in the fine arts, consult: Viollet-le-Duc, *Dictionnaire de l'Architecture*, articles "Proportion" and "Symétrie;" Robinson, *Principles of Architectural Composition* (New York, 1899); Dow, *Composition* (ib., 1900); Poore, *Pictorial Composition and the Critical Judgment of Pictures* (ib., 1903); Van Pelt, *A Discussion of Composition* (ib. 1902).

PROPOSITION (Lat. *propositio*, representation, a setting before, from *proponere*, to place before, from *pro*, before for + *ponere*, to place). The verbal expression of a judgment (q.v.); but the word is used by many logicians as synonymous with judgment. This usage is to be deprecated as resulting in confusion and as giving rise to the idea that a judgment can be cut up into as many mutually independent parts as result from the breaking up of a proposition into its grammatical elements.

PRO'PYLÆ'A (Lat., from Gk. *προπύλαια*, *propylaiā*, neu. pl. of *προπύλαιος*, *propylaios*, before a gate, from *πρό*, *pro*, before + *πύλη*, *pylē*, gate). In classical Greek, a structure erected outside the entrance gate or door of an important building, or of an inclosure containing several buildings. The word expresses the idea of a building of some elaboration with many parts. Thus the buildings called by classical writers *propylæa* are known to us as rather large roofed halls into which the visitor enters by several doorways or by the inter-columniations of a portico, and from which he reaches the sacred inclosure of a sanctuary or the reserved space around the buildings of a palace. There are *propylæa* whose plan and arrangement can be made out at Eleusis, Epidaurus, and other Grecian towns, but that of Athens is so far in good preservation that its roof is still partly in place, as well as the greater number of its columns; while the outer pediment and other parts which have been rebuilt have been so easily established by the use of their old materials and the like that there can be no doubt of the authenticity of the whole structure. Fortunately, this *propylæa* is also the most important of all Grecian buildings of the kind, so far as can be gathered from ancient authorities and from existing remains. In this case it was necessary to provide a stately entranceway into the sacred inclosure on the top of the Acropolis rock. A solid wall with five doorways, large in propor-

tion to the piers between them, has two porticoes: a shallow one on the inner or eastern side and a much larger and deeper one toward the approach from the west. This larger portico is flanked by two subsidiary buildings. The structure so planned provides two hexastyle Doric porticoes facing east and west, and two much smaller ones fronting the wings and facing one another, each of these with three Doric columns in antis. In addition to these Doric columns there are six Ionic columns flanking the principal gangway of approach; a carriage drive on the uncovered rock is carried right through the *propylæa* from the outer to the inner face, while the porticoes on either side have a raised level pavement with steps leading up to it. The whole *propylæa*, then, is in its principal mass about seventy-five feet square, while the width across the wings is about one hundred and fifty feet.

PROSAUR'IA, PROSAUR'I (Neo-Lat. nom. pl., from Gk. *πρό*, *pro*, before + *σαῦρος*, *sauros*, lizard). A subclass and order, respectively, of reptiles, extinct except the genus *Sphenodon*, with one living species, the tuatara (q.v.). They are mostly represented by Permian and Carboniferous fossils. The subclass contains two orders, *Microsauri* and *Prosauroi*; and the latter two suborders, *Protosauri* and *Rhynchocephali*. These "seem to represent the central stem of the reptilian tree," and the latter has a survivor in *Sphenodon*. Consult Gadow, *Amphibia and Reptiles* (London, 1901).

PROSECUTION (Lat. *prosecutio*, from *prosequi*, to follow, from *pro*, before for + *sequi*, to follow). In its technical legal sense, the institution and conduct of legal proceedings against one who is charged with a crime. In a more general sense it is sometimes used as applicable to civil as well as criminal proceedings. There are three methods of prosecution for crime. First, upon the unsworn complaint of an individual; second, upon the complaint of an officer appointed to institute prosecutions; and third, upon a sworn complaint. The first was the earliest method known to the common law. It was, in England, a permissible method of prosecution under the technical name of appeal as late as 1818. (See **APPEAL**.) The second method obtains in some European countries, but not in England or the United States, where the third method of prosecution upon sworn complaint is now used exclusively.

Prosecution by sworn complaint may be instituted by the complaint of a private individual or by the complaint of the attorney-general or other prosecuting officer, when the complaint is said to be on information; or it may be instituted directly by the grand jury, which makes its complaint in the form of indictment (q.v.) or presentment (q.v.). When made by a private citizen the practice is to file the complaint in the court of a justice of the peace or magistrate, whose duty it then is to issue a warrant for the arrest of the person charged with the crime. A person having been arrested upon complaint or by a peace officer or other person having authority to arrest, the magistrate has authority, if he deems the prisoner probably guilty, to hold him for the action of the grand jury or for trial by the proper court upon information filed by the prosecuting officer. When, however, the accused is a fugitive from justice, the information may be filed without the preliminary examination,

and an indictment may be found or presentment made by the grand jury before the arrest of the accused. Whether the accusation is by information or indictment, the accused when arrested is required to plead to the information or indictment and is then placed upon trial in the court having jurisdiction. For the other proceedings in a criminal prosecution, see ARREST; GRAND JURY; INDICTMENT; PROSECUTOR; PLEADING; PROCEDURE.

PROSECUTOR (Lat. *prosecutor, prosequitor*, from *prosequi*, to follow). One who institutes and conducts a criminal prosecution in behalf of the government.

In most European countries the duty of conducting prosecutions for criminal offenses is imposed on public officers. In England it has been customary for all criminal prosecutions to be conducted by counsel employed by private individuals, except in rare cases of crimes directly affecting the sovereign, when the prosecution was conducted by the attorney-general. In cases of private prosecution in England the person instituting the criminal proceeding is usually required to give a bond conditioned upon his proceeding with the prosecution. He can be relieved from this obligation only by the court or on the entry of a *nolle prosequi* by the attorney-general. The prosecutor is required to bear all the costs of the prosecution, but the court may award him a sum with which to defray his expenses in case of all felonies and most misdemeanors. This sum, however, is in practice usually inadequate. This system of private prosecution seems to have been quite effective, although burdensome to the prosecutor and liable to grave abuses.

In 1879 an act of Parliament (47 and 48 Victoria, c. 54) "more effectually providing for the prosecution of offenses in England" was framed which enacted that the Secretary of State might from time to time appoint an officer called the Director of Public Prosecutions, whose duty it should be to institute and carry on prosecutions under the direction of the Attorney-General. The authority of this officer, however, was somewhat limited, and it is still true that under the English system there is no officer whose duty it is to prosecute for all crimes.

In the United States, while prosecutions by private individuals are permissible, the English system of prosecution by private individuals exclusively is not followed. Both under the Federal Government and the several State governments provision is made for the prosecution of offenders by public prosecutors usually known by the title of district attorney (q.v.).

The prosecuting officer's authority is confined to the preparation and trial of cases. He cannot stipulate for exemption from punishment or as to the amount of punishment which shall be inflicted, although his recommendations are often accepted and acted upon by the court. In most States, but not all, he may with leave of the court accept the assistance of private counsel, but he still remains the responsible instrument of the law. He may, if the evidence or facts within his knowledge justify in his judgment the step, enter a *nolle prosequi*, thus ending the present prosecution, but not barring the right to begin a new action on the obtaining of further proof. In some States he must obtain the consent of the court to do this.

Besides district attorneys, there are in many

States special prosecutors appointed to conduct prosecutions in police and other minor courts with less power than that of district attorneys. Special prosecuting agents are also sometimes appointed to prosecute for violations of the liquor laws. See INDICTMENT; INFORMATION; JEOPARDY; NOLLE PROSEQUI; etc.

PROSELYTE (Lat. *proselytus*, from Gk. *προσήλυτος*, convert, one who has come over, from *προσελθεῖν, proselthein*, to have come toward, from *πρός, pros*, toward + *ελθεῖν, elthein*, to have come). A convert, generally to a new religion. In the Septuagint the Greek *προσήλυτος*, is the usual translation of the Old Testament term *gēr*, i.e. one who takes up his residence in a foreign land and puts himself under the protection of a foreign people. It is applied more particularly to the foreigner residing in Palestine, but in the New Testament is the name given by the Jews to a convert to Judaism. The transition, however, from the former to the latter meaning is already foreshadowed in certain parts of the Old Testament belonging to the exile period, as in certain passages of the Priestly Code (e.g. Num. xv.) and in Isaiah (e.g. chap. xiv.), but it was not until the second century B.C. that the term proselyte fully acquired its technical sense. According to Jewish law circumcision was an essential preliminary to admission into the synagogue as a member. The proselyte is therefore a *gēr* who has been circumcised, but by the side of the proselyte in the full sense Rabbinic literature recognizes a class of persons known as 'proselytes of the gate' who had taken up their residence in Israel's land without embracing Judaism by the act of circumcision. It is almost equivalent to the biblical phrase 'a sojourning *gēr*' (e.g. Lev. xxv. 47). The phrase, however, as well as the class, has only a theoretical significance, and as a matter of fact there was at all times only one class properly designated as proselytes. In view of this, another phrase, 'the god-fearing ones,' which is particularly prominent in the Book of Acts, must not be confused with proselytes, though it might seem that at times the line of demarcation between the two is very faint. The inflow of foreigners into Palestine after the Greek conquest, the more intimate contact of Jews with non-Jews both within and without Palestine, the spread of Jewish influence through the presence of Jews in Egypt, Persia, and elsewhere were important factors in making Judaism attractive to many who had lost their faith in the old gods. The decay of the Greek religion was a powerful stimulus to a movement which at one time promised to increase the numbers of believers in Judaism considerably, but the nationalistic tinge of the Jewish religion as well as its elaborate ceremonialism acted as checks to the movement, and the actual number of those who went over completely to Judaism was not very large. On the other hand, those who might be designated as sympathizers with Judaism, who had cast aside their own religious customs and adopted some of the Jewish ones, such as the observance of the Sabbath, certain dietary laws, contributing to the temple treasury, and the like, while openly proclaiming their belief in the essential doctrine of Judaism—namely monotheism—were very numerous. It is to these that the term 'the god-fearing ones' more particularly applied.

The full proselyte, known in Rabbinical litera-

ture as 'proselyte of righteousness,' in addition to submitting to the rite of circumcision had to receive instruction in the texts of Judaism and usually was obliged to carry out the precepts strictly. He was obliged to cut loose from heathen associations altogether, and after a certain time the ceremony of the ritualistic bath to symbolize his purification from the uncleanness of heathenism was also insisted upon. In Palestine proper converts to Judaism do not appear to have been encouraged by the rabbis. Pharisaism discountenanced missionary efforts and the growth of the new Christian religion, which threatened the lowering of all barriers, led to a further insistence upon the rabbinic ideal, which tended toward the separation of the Jews from the rest of mankind. Among the Jews, however, who lived in the Greek colonies, an active propaganda was carried on, more particularly during the century before our era, and the movement here was not without its effect on those who remained in the mother country.

A part at least of the Hellenistic Jewish literature is distinctly intended for heathen readers, written to convince them of the falsity of their own religion, and of the superiority of Judaism. To be sure, the Judaism advocated in this literature was no longer a pure product, and itself shows traces of the influence of Greek thought; yet in its main lines it was in keeping with the doctrines and tendencies of Palestinian and Babylonian Judaism. As a result of these proselytizing tendencies, Christianity found the way opened when the new religion felt strong enough to begin active missionary efforts; and in the measure that the Jewish Christians abandoned distinctively Jewish customs and rites, they attracted many to their ranks who had been prepared for the new faith by the dissemination of Hellenistic thought. In this manner Christianity reaped the benefits of the labors of the Jewish propagandist and became essentially a missionary religion. Judaism also continued to make converts, as the history of the Khozan Jews seems to show. But it gradually became characterized by a decided discouragement of additions to its ranks, increasing its restrictions and surrounding admission into the synagogue with difficulties that only a very limited number could overcome.

PROSERPINA (Lat., from Gk. Περσεφόνη, *Persephone*, Περσεφόνηα, *Persephoneia*, of unknown etymology). In Greek mythology, the daughter of Zeus and Demeter. The story of her abduction by Hades, the search and sorrow of her mother, and the return of Proserpina for a part of the year to the upper world, is given under CERES, where also is discussed the nature of the two goddesses, who were commonly joined in the cult. In Homer she appears as the dread consort of Hades, the ruler of the lower world, and enemy of life. With this probably belongs the genealogy that made her daughter of the Styx. This side is, however, far more prominent in literature and art than in the cult. In imprecations her name

is frequently invoked along with Hades and the Furies, who in Orphic theology are even called her daughters. So she rules the dead, and death comes in obedience to her command, while it is as her servant that Hermes leads the souls to her kingdom. Not that she is always stern, for in the stories of Orpheus and Alcestis she appears as moved to pity. In art, when with her mother, she is sometimes represented as of more girlish form, but even here she carries the torch of the goddess of the lower world. When represented with Hades, she is altogether the queen, commonly enthroned, and holding the sceptre, or sometimes the bunch of wheat, which conveys a reminiscence of her gentler function.

PROSKUROV, pr'ōskū-rōf'. A town in the Government of Podolia, Russia, situated near the Bug, about 60 miles north of Kamenetz-Podolsk. It has an extensive sugar mill and manufactures of flour and tobacco. Population, in 1897, 22,915.

PROSODY (Lat. *prosodia*, from Gk. προσῳδία, from πρὸς, *pros*, toward + ᾠδή, *ōdē*, song, from ἄδειν, *adein*, to sing). A term which originally meant the tone or accent of a syllable, and later was applied to a song sung to music. At the present time it is loosely regarded as that part of grammar which treats of quantity, accent, and the laws of versification (q.v.).

PROSPECT PARK. See BROOKLYN.

PROSPERITY ROBINSON. A name applied by William Cobbett to Frederick Robinson, Earl of Ripon, who boasted of the prosperity of the country in the House of Commons just before the financial crisis of 1825.

PROSPERO. The banished Duke of Milan in Shakespeare's *Tempest*, a wise and noble magician living on a desert island with his daughter Miranda. Some traits in the character seem to have been intended to suggest James I., before whom the play was first performed; but in more points it resembles Shakespeare himself at the close of his public career.

PROSPER OF AQUITA'NIA, SAINT (c.400-c.463). A learned layman of the fifth century, born in Aquitania. Little is known of his life, except that he was in Gaul from 428 until 434, and after that date probably lived in Rome. It was he who induced Pope Celestine to write a letter to the bishops of Gaul expressly confirming Saint Augustine's doctrine of grace, and he was recognized as the accredited defender of the Church's teaching on the subject against the Semi-Pelagians. His *Chronicle* (*Chronicon Consulare*) was completed in Rome. It is a continuation of that of Jerome and brings it up to 455, dealing especially with the history of dogma and of heresies.

His works, from the Benedictine text of 1711, are in Migne, *Patrologia Latina*, li. For his teaching on grace, consult Wörter, *Prosper von Aquitanien über Gnade und Freiheit* (Freiburg, 1867).

PROSS, SOLOMON. A spy and villain in Dickens's *Tale of Two Cities*. His sister, Miss Pross, a red-haired, ungainly, but unselfish woman, lived with Lucie Manette, and accidentally killed Madame Defarge.

PROSSNITZ, prōs'nīts (Bohemian *Prostějov*). A manufacturing town of the Crownland of Moravia, Austria, in the fruitful plain of Hanna, 11 miles southwest of Olmütz (Map: Aus-

tria, E 2). It manufactures woolen cloth, cashmeres, malt, sugar, brandy, agricultural implements, linen, and cotton stuffs. Population, in 1890, 19,512; in 1900, 24,054, mostly Czechs.

PROSTATE GLAND (from Gk. *προστάτης*, *prostatēs*, one who stands before, from *προιστάμαι*, *proīstanai*, to stand before, from *προ*, *pro*, before + *ιστάμαι*, *histanai*, to stand). A pale, firm, glandular body, surrounding the neck of the bladder and the commencement of the male urethra. The prostate gland secretes a milky fluid having an acid reaction, and when examined with the microscope showing columnar epithelium with granular nuclei. In old age it is liable to become enlarged, and it is also sometimes the seat of various diseases. Inflammation of the organ is rarely idiopathic, but not infrequently occurs as the result of gonorrhœa, or the use of instruments. Abscess may happen either as the result of acute inflammation, or it may occur with comparatively little antecedent inflammation, as sometimes happens in pyemia. Prostatitis is liable to produce retention of urine, either from inflammatory exudation or from the pressure of the congested organ. In such cases the urine must be drawn from the bladder by a catheter, an operation which, under the circumstances, requires considerable skill and knowledge in order to avoid injuring the gland. The enlargement spoken of above as occurring in elderly and aged persons, although liable to affect all classes, is more usual in those who have led irregular lives. In rare cases there is excessive development of the glandular element, and sometimes tumors are developed. The gland is rarely the seat of cancer as well as of tubercle. Prostatic calculi may occur, generally in old people, more rarely in young subjects. Prostatic enlargement is treated surgically by removal of the organ entirely or in part, the operation constituting prostatectomy. It is a grave operation. Consult Park, *Surgery by American Authors* (New York, 1901).

PROSTITUTION (Lat. *prostitutio*, from *prostituere*, to expose publicly, to place before, from *pro*, before, for + *statuere*, to place, from *stare*, to stand). Customary and common practice of lewdness for hire. Prostitution appears to have arisen in every race upon its emergence from the semi-promiscuity of barbaric life; certainly, no highly civilized people has ever been free from it. While it may thus be regarded as universal, it is not, however, a constant phenomenon, since its volume has unquestionably shown great tendency to variation.

The causes of prostitution are too complex for enumeration, but its principal conditions may be briefly indicated. It is most common where large classes of men live under conditions which do not permit of the founding of families, and where numerous women exist in so degraded an environment that they are not greatly influenced by the social abhorrence for professional vice. These conditions are fulfilled in most large cities, and for this reason it is not unnatural that prostitution has increased in the last century, since the proportion of the population living in cities has greatly increased. (See POPULATION.) It may therefore be regarded as a phenomenon of social pathology, since it is closely dependent upon the social grouping of population and distribution of wealth. It may be pointed out that the use of alcoholic beverages increases the num-

ber who live by vice, not only by increasing the attractiveness of such a life, but by creating in many homes conditions of so degraded a character that young children are early familiarized with evil. Recent changes in the mode of life of a large part of the race have no doubt given rise to many forms of physical degeneracy which naturally find expression in this form of vice. Further, the fact that a great deal of money finds its way into the hands of the prostitute renders it inevitable that a class of individuals should arise who make it their business to provide opportunities for vicious indulgence and to secure new victims for prostitution; and although there is no foundation for the popular belief that systematic procuration is responsible for the greater number of prostitutes, it remains true that in many cities there have existed and still exist agencies for procuring unwilling victims for vice.

Attempts to repress prostitution by penal laws have been common in all nations which have developed a high standard of personal purity. Such attempts were frequent in Jewish history. Prostitution was intimately associated with the worship of certain pagan deities (e.g. Astarte), and was therefore more severely punished than a mere moral offense would have been. In the early Germanic tribes prostitution, like any other form of unchastity, was severely punished as an offense against social and religious institutions. The conquest of the Roman Empire by Christianity resulted in the promulgation of repressive laws against prostitution. By the capitularies of Charlemagne, whipping, imprisonment, and exposure were imposed upon the prostitute and those who sheltered her. Repressive enactments appear frequently in the later Middle Ages, especially after the great epidemic of syphilis in the fifteenth and sixteenth centuries, when many States and cities adopted the harshest measures of repression, employing imprisonment, mutilation, and even capital punishment to this end. Upon her accession to the throne of Austria, Maria Theresa entered upon a systematic policy of repression, punishing severely both the prostitute and those who consorted with her. Repressive policies still appear sporadically in both Europe and America, but the inherent difficulties of police control of morals, together with the fruitlessness of past repressive policies, prevent their general adoption.

As an alternative to repressive measures, many governments have adopted the policy of tolerating prostitution itself, but under such regulations as might divest it of its attendant evils. These may be classed as social and hygienic. The social effect which was earliest recognized was its tendency to lower the general standard of chastity, and thus to impair the integrity of the family and to undermine the whole constitution of society. Classical and mediæval regulation endeavored to meet this evil by drawing a clearly defined line between women devoted to vice and those of honorable life. The prostitute was compelled to live in special quarters, and to wear a distinguishing garb. The same spirit evidently lies at the basis of modern police regulations, common in German cities and not uncommon in America, creating a 'reservation' within which prostitutes may live unmolested. It is assumed that when scattered among the general population prostitutes act as centres of contagion of moral disease. In small cities such regulations

have proved effective in centralizing vice, although grave doubts have been cast upon the social expediency of such a policy; and in large cities it has never proved satisfactory even to those who are convinced of the expediency of regulation.

A second social result of prostitution is the encouragement and opportunity it gives to crime. The prostitute and the criminal come to a large extent from the same social classes. The female members of criminal families are frequently prostitutes. Moreover, the fact that both classes are social outcasts tends to bring them into sympathy with each other. Many prostitutes form semi-permanent relations with low criminals (*souteneurs*, 'cadets'), and support them in the intervals of their criminal operations. The brothel furnishes easy opportunity for robbery and theft. To break up this alliance between vice and crime has been one of the constant endeavors of those who seek to regulate prostitution. In the Middle Ages it was a common practice to form quasi-guilds of the prostitutes, imposing upon them collective responsibility for all violence and disorder that might occur in the brothel. The present policy of the French police is to force prostitution, so far as possible, into brothels, the owner or tenant of which may be made responsible for crime. One of the purposes of the plan of confining prostitution in reservations is the greater ease of police supervision that may result from lessening the area in which prostitution operates.

The hygienic effects of prostitution, however, have attracted far more attention from modern students of the problem than the social effects. Prostitution has always been the source of serious contagious maladies, but in early times, owing to the backwardness of medical science, the relation between disease and vice was hardly recognized. The appearance in Europe of syphilis (q.v.) in epidemic form drew attention to this relation. In 1700 the Berlin authorities adopted the plan of periodic examination of prostitutes, with confinement in hospitals of the diseased, a policy now generally known as 'reglementation.' A similar plan was put into systematic operation in Paris in 1802, and during the first half of the nineteenth century was widely adopted in other European cities. The great majority of the large cities of Continental Europe pursue the same policy at the present time. Sanitary control of prostitution received an extended trial in England under the Contagious Diseases Acts, in operation from 1866 to 1883 in twelve stations in England and two in Ireland. A modification of the same plan was tried in America in Saint Louis (1870-73). In parts of Japan reglementation is the accepted method of dealing with vice. The ideal of reglementation is to compel every person devoted to professional vice to submit to periodic inspection for signs of disease. In Paris, which may be selected as typical of cities in which reglementation is well established, inmates of brothels are inspected weekly at their place of residence. These form only an insignificant fraction of the total number. The great majority live in furnished rooms, and are required to report twice a week at the dispensary. Each prostitute who submits to control is given a card which frees her from molestation unless her conduct is flagrantly disorderly. A register is kept of tolerated prostitutes, and when once enrolled upon the register, they cannot be freed

from the obligation of periodic inspection except upon evidence of a change in their mode of life. If they are found to be diseased, they are sent to the hospital of the prison of Saint Lazare, where they are detained until cured.

Registration may take place at the request of the prostitute, or by order of the official head of the 'Morals Police,' a body of police set apart especially for this service. Inasmuch as probably the majority of prostitutes regard their state as only temporary, expecting to return to honorable life sooner or later, they usually resist strenuously the efforts of the police to place them upon the register, since they believe that the register may be employed at any time in their lives to brand them with infamy. The chance of detention for months in a prison hospital in order to be cured of a malady which causes little suffering is another deterrent to the acceptance of police toleration. For these reasons the police are forced, by frequent arrests and imprisonment, to render the position of the unregistered or 'clandestine' prostitute as unsatisfactory as possible; and frequently the office finds it necessary to register prostitutes against their will. In spite of the incessant activity of the police, the number of those who are found on the register is only a small minority of the total number of prostitutes—not over 25 per cent., and probably nearer 10 per cent. What is true of Paris is true in the main of most other cities in which reglementation is practiced. In Berlin the police act with somewhat greater freedom in registering prostitutes against their will, but succeed in subjecting no very large percentage to control. The difficulties in the way of control are less in the smaller cities, and it is claimed that in some towns, e.g. Dorpat in Livonia, clandestine prostitution has been practically eradicated. This is, however, but very rarely the case, and no supporter of reglementation is optimistic enough to hope for equal effectiveness of control in large cities.

It is almost impossible to form a just estimate of the effect of reglementation in checking the spread of venereal maladies. Until the last decade it was generally believed by the medical world that statistical evidence existed which demonstrated clearly the sanitary advantages of reglementation. Those statistics have since been subjected to careful analysis, and have been proven to be practically worthless. Defenders and opponents of the system have practically agreed to discard statistical arguments and to rely upon common sense to defend their positions. Judged from this standpoint, it is obvious that the insignificance of the proportion of registered prostitutes to the total number and the comparatively long interval between inspections must limit narrowly the possible improvement in public health. What is more serious, it appears in the light of recent progress in medicine that the period of confinement for treatment is not sufficiently prolonged, and that many who are dismissed as well are capable of transmitting contagion. These defects in the system hardly admit of a remedy, since the police at present exhaust practically all means at their command to increase the proportion of registered prostitutes, and consequently it is impossible that more extensive registration can be instituted. To increase the frequency of inspections, or the length of the period of compulsory treatment, would greatly increase the difficulty of administration,

since it would diminish the number of those who submit voluntarily to control. If, as seems probable, the system increases the extent of indulgence in vicious pleasures through creating a popular impression that vice is innocuous, it is not inconceivable that relementation, as at present practiced, increases disease instead of diminishing it.

Relementation has always excited vigorous opposition of large classes in society. Adverse sentiment has been especially strong in England and America. The enactment of the Contagious Diseases Acts created a party of 'abolitionists,' who carried on a propaganda against the system until it was finally abolished. The same party has an increasingly influential following on the Continent of Europe, and aims eventually to abolish relementation there. The system is attacked on the grounds, (1) that it legitimatizes vice and encourages it by the attempt to make it innocuous; (2) that it is in violation of the principles of personal liberty, since it creates a class of persons over whom the police have practically unlimited power, and permits the police, on mere suspicion, to subject individuals to arrest and an insulting inspection; (3) that it tends to render difficult or impossible the reform of those who have once fallen into vicious habits of life; and (4) that it increases instead of checking the extent of disease. Furthermore, it creates a popular impression that prostitution is a necessary evil, and thus acts as a check upon efforts to prevent its increase and to assist fallen women to rise from their dishonorable vocation.

How far the charges of the abolitionists are true it is impossible to say. A conservative view is that little good results from relementation; possibly no more than could be gained by the now discredited policy of penalizing prostitution. Permanent amelioration of public health and morals depends upon limiting the absolute extent of vice. There can be little doubt that a greater regard for the welfare of neglected minors in the large cities would diminish the number of those who live by vice. Houses of refuge for those who desire to reform are now quite common. Such institutions have not hitherto been as successful as was expected. Investigation has shown that not more than five per cent. of the inmates of some of these 'Magdalen Houses' were permanently reformed. This has in part been due to the fact that such homes, founded by religious organizations, assumed that the reformed prostitute was to live a life of severe penance. Institutions which have aimed merely to offer a temporary refuge, and have sought to secure the return of the prostitute to an honorable place in society, have been far more successful. Societies for the rescue of girls who have fallen into the hands of professional procurers are also becoming prominent, and have already effected much toward the suppression of this form of slave trade. Finally, much may be expected from the present tendency to furnish greater opportunity to the poorer classes for education and culture, and from public and private endeavors to provide healthful amusement and society for those who otherwise fall a ready prey to morbid desires.

Jahrhundert und die Verhütung der Syphilis* (Leipzig, 1888); Fiaux, *La police des mœurs* (Paris, 1888); Tarnowsky, *Prostitution und Abolitionismus* (Hamburg, 1890); Blashko, *Die Verbreitung der Syphilis in Berlin* (Berlin, 1892); Selhmölder, *Die Bestrafung und polizeiliche Behandlung der gewerbmässigen Unzucht* (Düsseldorf, 1892); Commenges, *La prostitution clandestine à Paris* (Paris, 1897); Sanger, *The History of Prostitution* (revised edition, New York, 1898). This is the most extensive English work on the subject, but it takes practically no account of the scientific progress of the last three decades, and is therefore of limited value. *Conférence internationale pour la prophylaxie de la syphilis et des maladies vénéréennes* (Brussels, 1899-1900), the most valuable compilation on the subject, containing papers and discussions covering practically every phase of the subject. *Report of the Committee of Fifteen (New York) on the Social Evil* (New York, 1902).

PROSTYLE (Gk. πρόστυλος, *prostylos*, having columns in front, from πρό, *pro*, before + στῖλος, *stylos*, column). A temple with a portico in front. A temple with a portico at both ends was termed amphiprostyle.

PROTAGORAS (Lat., from Gk. Πρωταγόρας) (c. 485-c.411 B.C.). A famous Greek sophist of the fifth century B.C., born at Abdera in apparently humble station. He came to Athens as early as B.C. 445, and in that city and in Sicily won his fame as a teacher and philosopher. About B.C. 411 he was charged with impiety, because of his agnostic writings, and forced to flee into exile. He met his death by drowning in the Sicilian Sea. Protagoras was the first to call himself a sophist and to teach for pay; his instructions were valued so highly that tradition reports that he received as much as 100 minæ (\$1800) from a single pupil. He enjoyed the intimate friendship of Pericles and won great reputation for his brilliancy and skill. His chief works were entitled, *Truth* ('Αλήθεια or 'Αντιλογικά) and *On the Gods* (Περὶ τῶν θεῶν). His doctrine was a form of agnosticism, which declared that there was nothing absolutely good or bad—that such qualities are based simply on convention; hence it follows that each individual is his own final authority. This teaching is summed up in the (now proverbial) phrase, 'Man is the measure of all things.' Protagoras further turned his attention to grammar and the explanation of difficult passages in the poets; the distinction of genders and moods is also attributed to him. Consult Frei, *Questiones Protagoræ* (Bonn, 1845); Weber, *Questiones Protagoræ* (Marburg, 1850); Blass, *Attische Beredsamkeit*, vol. i.; Ritter and Preller, *Historia Philosophiæ Græcæ* (7th ed., Gotha, 1888); Zeller, *Philosophie der Griechen*, vol. i. (5th ed., Leipzig, 1892); Ueber-

weg, *History of Philosophy*, English translation, vol. i. (New York, 1872); Erdmann, *History of Philosophy*, English translation, vol. i. (New York, 1890).

PROTECTION (Lat. *protectio*, from *pro-tegere*, to protect, cover over, from *pro*, before, for + *tegere*, Gk. *στέγειν*, *stegain*, Skt. *sthaḡ*, to cover, Lith. *stogas*, roof, OIr. *teḡ*, house, OHG. *dah*, Ger. *Dach*, AS. *þac*, Eng. *thatch*). The term applied to the policy of encouraging and developing home industries by means either of bounties paid to home producers or of duties imposed upon goods imported from abroad. The encouragement afforded by bounties is so direct and certain that they have been preferred to duties by many writers, including Alexander Hamilton. Nevertheless they have been little used in practice, because of their cost and of administrative difficulties connected with them. The latest examples of the use of bounties are afforded by the sugar bounty provided in the United States tariff of 1890 (the McKinley Act) and the export bounties on the same commodity paid by Germany and some other European States. The former remained in force only four years, and is not likely to be revived, while the latter have been abrogated except in the case of Russia by the Brussels Sugar Convention.

Import duties serve to encourage home industries under the following circumstances: They must apply to goods that may be produced within the country imposing them; they must not be offset either by reductions in the export prices of the commodities taxed nor by internal revenue duties on the same commodities produced within the country; finally, they must serve to raise the prices of the taxed articles in the home market sufficiently to make their home production profitable. Given these conditions, a duty is increasingly protective according to the completeness with which it excludes the foreign producer from the home market. Its purpose is directly opposed to the acquisition of revenue, since it becomes perfectly protective only when it prohibits all importation, that is, ceases to afford any revenue whatever. It is for this reason that highly protective tariffs need to be supplemented by revenue schedules and even internal revenue duties to satisfy the fiscal requirements of modern governments. See **TARIFF**.

The policy of protection does not differ outwardly from the restrictive policy advocated by the Mercantilists (see **MERCANTILISM**), but is defended on grounds quite independent of their erroneous balance of trade theory. As pointed out elsewhere (see **FREE TRADE**), protection is the policy practiced by most of the governments of the world. In this article attention will be directed to protection as it has been applied in the United States. Similar arguments to those reviewed are advanced in justification of the policy in other countries, and there is therefore no occasion to repeat them.

When the American colonies gained their independence, free exchange with the mother country was the policy advocated on all sides. The restrictive measures put in force by England herself after 1783 made the realization of this ideal impossible and fostered a sentiment in favor of protection to home industries as a means of rendering the United States industrially, as it had become politically, independent. Tariffs passed by Massachusetts and Pennsylvania in 1785-86

reflect clearly this protectionist attitude, as does the first national tariff passed in 1789. There was still some misgiving as to whether the country was adapted to manufacturing, however, and the first Secretary of the Treasury, Alexander Hamilton, was asked to submit to Congress a report on manufactures, together with recommendations to guide its future policy.

The famous *Report on Manufactures* was submitted in December, 1791, and has remained down to the present day one of the most important documents in the literature of protection. Hamilton reviewed the arguments for and against protection, described the development of manufactures in the United States, the resources of the country fitting it for manufacturing industries, and the policy of Great Britain in taxing its exports. He concluded that in the light of the actual situation a moderate protective policy designed to build up within the country all of the industries necessary to national independence and to the most rapid development of natural resources was advisable. In coming to this conclusion he ascribed great importance to England's restrictive policy, and said repeatedly that but for these restrictions a freer policy on the part of the United States might be desirable. He also emphasized his conviction that industrial independence is indispensable to continuous political independence, and that it is the part of wisdom for a new country to foster within its borders, even at considerable sacrifice, the industries necessary to a complete national life, not forgetting those concerned with the munitions of war. Hamilton's arguments continued to carry great weight with American statesmen down to about 1850, when England's secession to free trade and the undoubted ability of the United States to hold its own in any international complication that was likely to arise had deprived them of their force.

During the years immediately following the completion of Hamilton's report, the situation was so favorable to the development of the shipping industry of the United States that little attention was given to the question of protection. The Napoleonic wars made shipping under the flag of a European State hazardous and gave America, as the only important neutral country, the lion's share of the world's carrying trade. While this condition continued, shipping and commerce flourished in an unprecedented fashion. The situation was abruptly changed by Napoleon's Berlin Decree and the British Orders in Council of 1806-07, which set up a paper blockade of all important European ports and deprived American merchant vessels of the immunity which they had previously enjoyed. The United States retaliated with the Embargo (1807) and the Non-Intercourse Act (1809), and finally became involved in the War of 1812. From 1807 to 1815, in consequence of these difficulties, the United States was more nearly isolated industrially than ever before or since. Foreign trade was almost entirely suspended and the country was forced to produce for itself nearly all of the commodities which it required. It was during this period that manufacturing first developed to the position of an important American industry. When it ended, the industrial situation was so different from that described by Hamilton that the whole question of protection assumed a new aspect.

The Tariff Act of 1816, the first out-and-out protective tariff that the country had known, was defended more on the ground of protecting industries already established than of building up new industries. In fact, the highest duties provided were to remain in force only three years, since it was believed that by that time our manufactures would be adjusted to the conditions of peace and able to hold their own against foreign competitors. The erroneousness of this view was soon demonstrated, and succeeding tariffs continued the protectionist policy, although with modifications, down to 1857. During this period the 'vested interests argument,' the 'home-market argument,' and the 'infant-industry argument' were those most frequently urged in support of protection. The vested interests plea needs no explanation. It is always urged by conservative people in favor of the continuance of an established policy and does not pretend to throw any light upon the expediency or in expediency of the policy itself. The home-market argument, as advanced by Henry Clay, the father of the 'American system,' as protection began to be called, was designed to reconcile the interests of the agricultural South and West with those of the manufacturing North. It rested upon the proposition that the prosperity of the American farmer depends upon a regular and constant market for his products and that such a market is to be obtained only by building up manufacturing centres within the country. The experience of the years from 1816 to 1825 was cited to prove that the foreign market was not to be depended upon, and farmers were exhorted to unite with manufacturers in establishing a system which should bind different sections of the country together by furthering the interests of all. To the greater stability claimed for the home market—a quality now seriously questioned by economists—later analysis has added another merit. The home market calls not only for the stable products which will bear ocean transportation, but for all kinds of perishable goods. Substituting it for the foreign market renders possible diversified farming and enables cultivators to substitute for one-crop systems of agriculture scientific rotation of crops, which serves to preserve and perpetuate the fertility of the soil. This advantage is believed by protectionists to outweigh the admitted losses incidental to the protectionist policy and to insure in the long run a greater degree of prosperity than will result from the free play of economic forces.

The infant-industry argument is the one to which economists generally have conceded greatest weight. It is urged in both a special and a general form. As it applies to special industries, it rests on a recognition of the risks and difficulties which attend the domestication of new branches of production. In the successful prosecution of any industry three factors cooperate—the requisite natural resources, skilled and unskilled workmen of different grades, and the appropriate forms of capital. As regards each one of these the country which has practiced an industry has a marked advantage over the country which has not. The natural resources of the latter may be superior, but they are undeveloped; its labor force may be ample and adaptable, but it is untrained; its people may be competent to use tools and machines, but they have no familiarity with the special forms of capital

needed. Under such circumstances the encouragement of a protective tariff may suffice to induce investors to establish the new industry when without it they would not venture on such a step. After a few years, if the industry to be domesticated has been wisely chosen, the initial difficulties will have been surmounted and the protective duty may be withdrawn without danger of crushing out the now vigorous infant. Advocates of such a policy recognize quite clearly that resort to protection entails a serious burden on consumers. They justify the temporary loss on the ground that the establishment of the new industry on a permanent footing affords in the end a more than compensating gain.

The infant-industry argument in its general form recognizes that countries must usually pass through different stages of industrial development, and advocates protection as a means of accelerating progress during the periods of transition from one stage to another. The best statement of this argument is that given by Friedrich List in his *Das nationale System der politischen Oekonomie* (1841). The conclusions at which List arrived were based on the contrast between an industrial country like England and an agricultural country such as Germany was at the time he wrote. In his opinion England's success as a manufacturing country was due chiefly to the development of certain industrial qualities among her people. Germany, he thought, might develop the same qualities among Germans by means of a protective policy which would force them to manufacture for themselves. Through protection the natural resources of the country necessary to the development of manufacturing would also be opened up to exploitation. From this point of view protection is a temporary means by which an agricultural country may transform itself into an industrial country. After the transformation is completed the new manufacturing industries, or at least a great many of them, will be quite capable of holding their own in competition with the manufacturing industries of other countries and protection will be no longer required.

The last stage in the development of protection in the United States was closely connected with the Civil War. The outbreak of that struggle caused the withdrawal from Congress of the Representatives of the Southern States, who had been the most active opponents of the protective policy. Under the guidance of Representatives from the North and West successive tariffs were passed carrying the policy of protection to the most extreme lengths which the country had known. Factors in this development were the anti-foreign sentiment which resulted from the somewhat hostile attitude of Europe and especially of England to the cause of the North, and the comprehensive system of internal revenue taxation adopted during the war, which had to be offset by higher import duties if American producers were not to be placed at a disadvantage in competition with foreign producers. The change in the level of duties which resulted from this combination of circumstances is indicated by the fact that whereas under the act of 1857 the highest duties imposed were 24 per cent. *ad valorem*, under the act of 1864 the average rate on dutiable articles was over 47 per cent. During the first 15 years after the close of the war the attention of Congress was occupied by questions

of reconstruction, the resumption of specie payments, etc., and no change of importance was made in the tariff except that it became increasingly protective as the internal revenue duties were one by one removed. When attention was again concentrated upon the tariff question the attitude of protectionists was that of conservatives desiring to continue a policy which had been tried and found successful, and upon advocates of free trade rested the responsibility of wishing to overturn an established institution. Down to 1894 all of the important changes made in the tariff were in the direction of increased protection. The Wilson Act of the latter year was a reactionary measure, but was so garbled in its passage through Congress that the tariff-reform President of the period, Mr. Cleveland, allowed it to become a law without his signature. The victory of the Republicans in 1896, although not connected with the tariff issue, involved as an incident a return to a highly protective policy. In fact, the Dingley Act of 1897 marks the extreme limit of protectionist policy in the United States down to date.

During this last period only one new argument of importance has been advanced in support of protection, the 'wages argument.' Before protection was the settled policy of the country one of the reasons urged in its favor was that since wages were higher in the United States, some special encouragement was necessary to the establishment there of new industries in competition with the low-wage labor of Europe. After protection became a settled fact, by an interesting inversion, the high wages of American labor began to be attributed to it. The wages argument runs as follows: In protected industries higher wages are paid in the United States than in similar industries abroad. Protection, it is concluded, causes the high wages, and its withdrawal would pauperize American labor. This view overlooks several important facts. First, equally high wages are paid in unprotected industries, and these industries, which include farming, mining, transportation, and many branches of manufacturing, vastly exceed in importance and magnitude the protected industries. Second, employers, whether protected or unprotected, desire to secure their labor as cheaply as they can, and there is nothing in a protective tariff which forces them to pay higher wages than are current in the community in which the protected industries are situated. In other words, employers in protected industries pay the wages necessary to get the labor they require, and these depend not upon the protective tariff, but upon general industrial conditions. Third, it is not true that high wages and protection always go together. For example, wages in protectionist Germany are distinctly lower than in free-trade England. For these reasons the wages argument, although effective for campaign purposes, has never enjoyed much repute among trained economists. It is, however, urged in a more subtle way by some writers, and in this form merits consideration.

It is argued that the wealth produced in any country is divided into wages, profits, and rent, and that the amount of the last share depends upon the poorness of the marginal land and other natural resources to which resort is made. Protection, as applied in the United States, diverts labor and capital from farming and extractive

industries to manufacturing. In consequence, it is claimed, the margin of cultivation to which resort is made is somewhat higher under a protectionist than it would be under a free-trade policy and rents are lower, while wages and profits together are proportionately higher. Hence, it is concluded, protection raises wages at the expense of rent and 'other monopoly incomes.' In answer to this argument it need only be pointed out that the reasoning, if valid, proves merely that protection secures for labor a larger *relative* share of the total product. If, in so doing, it diverts labor and capital from investments in which they would afford larger returns, as advocates of free trade maintain, it may very well be that labor's larger share of the *smaller* product obtained under the régime of protection is actually less than would be labor's smaller share of the *larger* product that would be secured under the régime of free trade.

Present-day advocates of protection in the United States may be divided into two classes—those who defend it as a temporary and those who defend it as a permanent policy. Among the former it is beginning to be actively discussed whether protection has not done its greatest possible service for the country and whether a gradual transition to a free-trade policy would not be desirable. Writers answering these questions in the affirmative advocate the abolition of the protective duties on raw materials, trust-made manufactures, etc., and emphasize the importance of allowing foreign goods to enter the country more freely in order that American industries capable of developing an export trade may find larger foreign markets for their products. Advocates of protection as a permanent policy urge it not only on economic grounds, but as a means of fostering the sentiment of nationality and of perpetuating those characteristics which distinguish the United States from other countries. Free trade is characterized by them as a cosmopolitan policy, which appeals to the 'foreign-hearted,' while protection is extolled as the national system to the support of which all true lovers of country must rally. Strong as is the appeal which these 'higher considerations' make to the patriotic citizen, there is a certain vagueness about their application to tariff problems which makes the shaping of a law by reference to them difficult. Appeals to patriotism in connection with protection are significant chiefly because they introduce a moral earnestness into discussions which would otherwise be narrowly commercial.

Since Great Britain adopted a free-trade policy in 1846, the leading protectionist country of the world, next to the United States, has been Germany. There also the application of protection has been coincident with a remarkable development of manufacturing industries, which has seemed to justify fully the expectations of advocates of the policy. Germany's success in domesticating manufacturing industries has led France, Austria-Hungary, and, more recently, Russia, to emulate her example. Europe is thus engaged in a war of hostile tariffs, in which each important country is trying to build up its own industries by discouraging importations from its neighbors. In each country there is vigorous opposition to the protectionist policy, just as there is in the United States, but it is doubtful whether this opposition is making much real headway. There

are, however, indications that as time goes on the areas embraced within protectionist barriers in different parts of the world will be enlarged. In Europe there is already agitation for a federation of important States for the purpose of erecting an unbroken tariff bulwark against the 'American invasion.' In Great Britain an imperial federation to include all of the dependencies of the country in a commercial alliance against the rest of the world is beginning to be advocated. Finally, the policy of expansion upon which the United States seems to be embarked must have as one of its incidents the admission of new areas within the American tariff wall. As protectionist areas grow, the difficulty of harmonizing divergent interests by means of protective tariffs is bound to increase, and this affords perhaps the surest ground for a belief in the eventual triumph of free trade.

PROTECTIVE ASSOCIATION, AMERICAN.

A secret organization, commonly known as the A. P. A., which was formed in the United States to combat the influence of Roman Catholicism. Its platform, as published by a Supreme Council held at Des Moines, Iowa, in May, 1894, stated that "subjection to and support of any ecclesiastical power not created and controlled by American citizens is irreconcilable with American citizenship," that State assistance to parochial schools and Church interference with public education are undesirable, and that restrictions ought to be imposed on immigration. Candidates for admission into the order were required to take oath never to favor or aid the choice of a Roman Catholic to political office, and never to employ a Roman Catholic in any capacity if the services of a Protestant could be obtained. The order was first established at Clinton, Iowa, in 1887. It obtained its greatest foothold in the Middle West, but it extended even to Canada, England, and Australia, and an international organization was ultimately effected. In 1896 its president, W. J. H. Traynor, claimed for it a membership of almost 2,500,000. The methods which it used to extend its influence are thus described by a writer in *The Nation*: "Documents purporting to be authoritative utterances of the Roman Catholic hierarchy were passed from hand to hand. No one could tell where these were printed or who was responsible for them. One was entitled 'Instructions to True Catholics;,' another purported to be an encyclical letter from the Pope, calling upon the faithful to rise on a certain date (September 13, 1893) to massacre all Protestant heretics. Certain newspapers, filled with similar literature, with the most alarming reports of Roman Catholics drilling and arming in preparation for an outbreak, and

making the most shocking charges against priests and nuns, were sent to prominent persons and distributed from hand to hand. Accompanying these were exaggerated reports of the number of Roman Catholics holding public office." The order soon began to interfere in politics, and forced many candidates for office to promise to act in accordance with its principles. In 1896 its president claimed that almost one hundred of the National Representatives and many of the Senators chosen in 1894 had given such pledges, although many had broken them. For a time it seemed that the order would probably run a similar course to the Know-Nothings (q.v.), with which it was often compared. Soon, however, the denunciations of clear-sighted, influential men, and the realization that the dangers dreaded were almost if not altogether imaginary, had their effect, and the decline of the order was even more rapid than its rise. Affiliated with the A. P. A. were the United Order of American Mechanics, the Patriotic Order of the Sons of America, and other organizations.

PROTECTIVE COLORATION AND RESEMBLANCE.

All organisms are beautifully adapted to the world around them, and this adaptation in a large proportion of animals extends to their colors. The adaptive coloration of animals, the harmony in tint and form with the trees or herbs on which they live, the moss-grown rocks among which they hide, or the sand over which they run, are a part of the general adaptation or harmony in nature. A desert animal is of a sandy complexion, a silkworm moth is brown, and the zebra, tiger, leopard, and butterflies are striped and barred or spotted, in response to the same agencies of light, heat or cold, moisture or dryness, that have had to do with the origin of species. Owing to this adaptive coloration, certain insects, frogs, reptiles, birds, and mammals are protected from the observation of their natural enemies.

In marine fishes the ground coloration is, according to Jordan, protective in its nature. The fish, especially if swimming near the bottom, is better protected if the olivaceous surface is marked by darker cross sheaths and blotches. These give the fish, he says, a closer resemblance to the weeds about it, or to the sand or rocks on which it lies. As a rule no fish which lies on the bottom is ever uniformly colored. At a depth of from 50 to 150 fathoms in the tropics a large proportion are red of various shades. Several of the large groupers of the West Indies are represented by two color forms; the shore form is olive green, and the deeper-water form is crimson. Deep-sea pikes are black or violet black, with no markings. Desert animals are gray or tawny or sandy; forest animals are green, marine animals olive or reddish, pelagic animals transparent while the typical Arctic mammals and birds are white; the white color of their feathers or fur was undoubtedly primarily due to the cold of the glacial period. The polar bear, hare, snowy owl, and Greenland falcon are white throughout the year, while the fox, lemming, American hare, ermine stoat, and ptarmigan change their summer dress of russet to white. There has been much discussion as to the causes of the white color of Arctic animals. It is by many attributed to cold, and this is evidently the primary cause, but to cold we should add dryness.

The blanching of the hairs is due to partial, not entire, depigmentation.

COLOR PREFERENCE. Different aquatic animals exhibit a marked preference for certain colors of the spectrum in which they 'feel better.' The little fresh-water crustacean *Daphnia* prefers to swim in orange, yellow, and especially green rays. The starfish shuns the red rays. Animals which love the light, as bees, prefer blue or green rays, while the light-shunning or lucifugous insects, such as ants, have less antipathy for red than for other colors. In such cases it has been thought by Cuenot that light doubtless acts as an excitant on respiration. As has been repeatedly noticed, the common house-fly prefers green to lavender, and black to white. On the other hand, locusts are attracted and will alight upon white or light-colored clothes, and not be attracted by dark. The preference of flies for dark cloth may be due to the fact that it absorbs more heat than white cloth, and thus favors quicker respiration and greater activity, especially in the coolness of the autumn.

PROTECTION DUE TO CONSPICUOUS BARS, STRIPES, AND SPOTS. Although the giraffe, the zebra, and the jaguar seem most conspicuously colored, we are assured that the spots upon the jaguar, for example, harmonize with the oval patches of sunlight. Sir Samuel Baker says that the striped skin of the tiger harmonizes with dry sticks, yellowish tufts of grass, and the remains of burnt stumps of its habitat, and even the giraffe is far from conspicuous when found in its native forests. The African antelopes are strikingly marked on the body and head as well as the feet with white stripes and patches in general like those of zebras, which Pooock regards as "representing spots or streaks of sunlight passing through foliage or reflected from leaves," and that these marks are for protection rather than for recognition. He thinks that such markings come within the scope of Thayer's hypothesis of concealment by the counteraction of light and shade. Of the species of elands of Africa one lives in the forest and is reddish and conspicuously striped with white, the neck being black; on the other hand, the common eland is dun-colored with no sign of stripes and lives in deserts. So it is with the koodoos; the lesser one living in thick jungles is much more strikingly marked than the larger species which lives in hilly mountainous regions or on the open plains.

MIMICRY. Many butterflies of the group *Heliconiidae* are associated with species of *Leptalis* belonging to another family (*Pieridae*) which copy the heliconid butterflies in form and color, and which, probably owing to a bad odor secreted by glands in the end of the body, are distasteful to birds. It is supposed by Bates, Wallace, Darwin, and others that were not the mimics disguised as heliconias they would be devoured by birds and thus become extinct. These authors believe that the resemblance has been brought about by natural selection. In his "Contributions to an Insect Fauna of the Amazon Valley," Henry Walter Bates (q.v.) calls attention to the fact that a large number of the species of *Heliconiidae* "are accompanied in the districts they inhabit by other species which counterfeit them." According to Fritz Müller (although Bates states the same idea), the species serving as the model, being unpalatable to birds on account of its repulsive taste and odor, is therefore safe from its

foes, while the mimic, which has no bad taste or odor, is protected from attack. Mr. Bates's own views are moderate compared with those of Wallace and later extreme advocates of Darwinian mimicry. In his original essay Bates shows that the majority of the species of *Heliconiidae* have very limited ranges, and contends that the cause of the formation of the local varieties is "the direct action of physical conditions on the individuals." Several entomologists, Elwes, Packard and others, have not accepted the hypothesis of Bates and Müller, that the mimicry is due to natural selection, but hold that the mimicry is accidental and due to convergence to similarities in the environment. The markings, such as similar hues in models and mimics, bars and spots, Packard believes are due to such effects of light and shade, moisture and temperature, as have produced them in birds, mammals, and reptiles. They may be perpetuated and preserved by natural selection, but the primary cause of this originally is the action of the physical agents mentioned, or at least environmental causes affecting both models and mimics. Much stress is laid on the attacks of birds in bringing about or aiding the process of natural selection of these markings. It is, however, to be observed that neither Bates, Müller, nor Wallace, all of whom lived for many years in the tropics, has ever seen a bird chase and devour butterflies. In fact, only a few insectivorous birds catch butterflies or care to chase them. After several years' special research on the habits of sparrows and other insectivorous birds, Judd states in a report to the United States Department of Agriculture that he does not know of any kind of bird "that feeds upon butterflies during any month of the year to the extent of one-tenth of one per cent. of its food."

It thus appears from a comprehensive survey of the markings of animals of different classes, living both in the sea and on land, that the causes of the similarity in their markings are due to the effects of light and shade, also perhaps to moisture—at all events to the action of the surroundings. It should also be borne in mind that the range of primary colors is not very great, nor of stripes and bars; under similar physical conditions the colors and spots and stripes and their location on the body are repeated in animals of different groups and species. Nature is limited in the disposal of ornamental features. Hence models and mimics may be protectively ornamented with the same hues and patterns, and it is probable that selection and the attacks of birds and lizards have had little to do with the origination of protective coloration.

PROTECTOR. An English title equivalent to that of regent, denoting a non-regal head of the Government under exceptional circumstances, as during a minority or an interregnum. The title was given to Humphrey, Duke of Gloucester, during the minority of Henry VI. from 1422 until the crowning of the young King in 1430. Richard, Duke of York, father of Edward IV. and Richard III., acted as Protector of the Kingdom at different times during the later years of Henry VI.'s reign. His son, Richard, Duke of Gloucester, was Protector for about two months in 1483, prior to his accession in the same year as Richard III. The Duke of Somerset, at the head of a council during the minority of Edward VI., bore the title from 1547 to 1549, until he was deposed by his colleagues. In 1653 Cromwell was installed as Lord Protector of the Commonwealth of England, Scotland, and Ireland under the provisions of the Instrument of Government (q.v.), and in 1657 was reinstalled under the provisions of the Humble Petition and Advice. On his death, in 1658, his oldest son, Richard, succeeded to the title and authority, but resigned the office in the following year.

PROTECTORATE. A relation assumed by a stronger nation toward a weaker one whereby the former protects the latter from hostile invasion or dictation and interferes more or less in its internal affairs. This relation is established by treaty between the protecting and the protected State, or among a number of States in respect to another State, by which the extent and character of the protectorate are determined. Usually the foreign relations of the protected State, including the right to wage war, are controlled by the protecting State. Examples of existing protectorates are Tunis, under French protection, and North Borneo, Bechuanaland, Somaliland, British Central Africa, and British East Africa, under British protection.

PROTEIDS. See PROTEINS.

PROTEINS (from Gk. *πρωτος, prōtos*, first). A name applied to an exceedingly important group of chemical substances, occurring abundantly in the organisms of animals and plants. The principal component elements of the proteins are carbon, hydrogen, oxygen, and nitrogen. When burned, however, the proteins generally leave behind a certain amount of mineral matter, and it is as yet unknown whether such mineral constituents form with the organic portion of the proteins true chemical compounds, or merely physical mixtures. The classification of the proteins is based, not on their chemical constitution, as in the case of most other groups of carbon compounds, but on a knowledge of some of their physical properties and of their behavior toward certain reagents. Such a classification is from a scientific point of view very imperfect, and so it must remain until light shall be thrown upon the

arrangement of the atoms within their molecules. This, however, is a very difficult problem. In the first place, the proteins are as a rule quite unstable and are strongly affected by ordinary chemical reagents and by relatively slight changes in the physical conditions. Further, any one familiar with the methods of determining the constitutional formula of an organic compound (see CARBON COMPOUNDS) will readily see the difficulty of ascertaining the constitution of a compound, for instance, like the oxyhæmoglobin of horses' blood, whose molecular formula is, according to Häfner, $C_{555}H_{1225}N_{149}S_2FeO_{149} \cdot 28H_2O$. Yet this is a crystalline compound, and so it is probable that it has been isolated. In the case of amorphous substances, as most proteins are, even this often remains uncertain, and then our knowledge is from the point of view of the theoretical chemist very imperfect indeed. It must also be remembered that the protein substances as they exist in the organism of a living animal or plant are probably more or less different from what they are when examined in the test-tube of a chemist. What the difference consists in is not known, for we are entirely ignorant of the nature and character of living matter. And so all statements concerning the proteins refer to dead protein alone.

In discussions of the food and nutrition of man and animals the term 'protein' is commonly applied to the total nitrogenous material present in the food or feeding stuffs of animal and vegetable origin, and includes a number of different groups of compounds with correspondingly different nutritive values. The group in its relation to nutrition is commonly subdivided as follows:

Protein	{	Proteids	{ Albuminoids. Collagens or gelatinoids.
		Non-proteids	{ Amides. Amido-acids, etc.

The albuminoids, sometimes called 'true proteids,' which include albumin, globulin, etc., are the most important of the nitrogenous constituents of foods, examples being the albumin of milk and eggs, the casein of milk, myosin of meat, gluten of wheat, etc. The gelatinoids are mostly of animal origin and include collagen, gelatin, elastin, keratin, etc., bodies which are characteristic of connective tissues as tendons, ligaments, horns, etc. Distinguished from the above are the non-proteids, which include the kreatin, kreatinin, and other extractives of meat, and the amides, amido-acids, etc., of vegetable foods.

In general the protein of animal foods and cereal grains is very largely composed of proteids, especially those designated above as albuminoids or true proteids. The true proteids can be transformed into nitrogenous body material and thus go to form the blood, muscle, tendon, nerve, etc., of the animal body. They are also sources of energy. Gelatinoids, such as gelatin, when burned in the body, yield energy, but cannot go to form nitrogenous tissue. Like carbohydrates and fat, gelatinoids undoubtedly protect protein from cleavage. The non-proteids, though useful to give flavor, etc., appear to have but little nutritive value except in so far as they serve as fuel for the body. It may be that some of them have an especial use as spacers of protein. Thus it has been suggested that asparagin may serve as a nitrogenous nutrient in the place of proteids for

intestinal bacteria. However, too little is known of the functions of the non-proteids to warrant very definite assumptions. From what has been said it is evident that protein is essential for building and repairing the body and that it may also be burned in the body to yield energy, the amount being very often estimated as 9.3 calories per gram digestible protein. Thus protein has two functions, whereas fat and carbohydrates have but one, namely, to serve as sources of energy. See Foon.

As noted above, proteids are widely distributed in products of animal and vegetable origin. Green plants build up proteids from simple bodies, obtaining the necessary nitrogen from complex nitrogenous organic compounds occurring in the humus of the soil, from ammonium salts, from nitrates, and from the nitrogen of the air. Among the higher plants it seems to be principally the Leguminosae which can utilize free nitrogen. This they do by the aid of the micro-organisms present in the tubercles on their roots. (See GREEN MANURING.) Amides and asparagin are intermediate bodies in the formation of proteids in plants. It may be said in general that animals derive their proteids primarily from vegetable sources. The changes which proteids undergo before being added to the substance of the body and the possibility of the formation of proteids from simple nitrogenous substances in the body are questions which are not settled or well understood.

CLASSIFICATION OF PROTEIDS. The following classification of proteids, which is an expansion of that given above, is largely that proposed by Halliburton, and is believed to be applicable to both animal and vegetable proteids. It is based chiefly upon differences in solubility of the various bodies:

Proteids	{	Simple proteids	Albumins (Serum albumin, egg albumin, lact-albumin, gluten and gliadin of wheat, zein of maize, etc.)
			Globulins (Fibrinogen, serum globulin or paraglobulin, egg globulin from white of egg, myosinogen from muscle, crystallin from the crystalline lens, wheat globulins, and other vegetable vitellins.)
			Proteoses (Albumoses, globuloses, vitelloses, etc.)
			Peptones (Diffusible end-products of digestion.)
			Coagulated Proteids
			{ Those coagulated by heat.
			{ Those coagulated by ferments (Fibrin, myosin, casein, etc.)
			Haemoglobin
			Compound proteids
			{ Gluco-proteids (Mucin and mucoids.)
{ Nucleins and nucleo-proteids			
Collagens or gelatinoids* (Collagen, casein, gelatin, elastin, keratin, and chitin.)			
Protamines (Histidin, arginin, and lysin.)			

* Halliburton and some others call this group 'albuminoids.' This term is otherwise applied by many investigators and its use as indicated leads to considerable confusion. The term 'collagens or gelatinoids' is perhaps more commonly used in the United States.

The proteids possess a number of general characteristics. All are insoluble in alcohol and ether. Water will dissolve some, but not all. Many of those insoluble in water are soluble in weak saline solutions, and some are soluble and others insoluble in concentrated saline solutions. With the aid of heat all proteids are soluble in concentrated mineral acids and alkalis, but are transformed as well as dissolved. Proteids are soluble by the aid of ferments, as those in gastric and pancreatic juices, but in this case they also undergo a change, adding water and breaking down into proteids of smaller molecular weight known as peptones, intermediate bodies formed in the process being called 'proteoses' or 'albumoses.' Many proteids soluble in water or saline solutions, especially the albumins and globulins, are rendered insoluble or are coagulated when heated. A familiar example of this is the coagulation of egg white in cooking. The temperature required for coagulation differs with different proteids. With the exception of peptones, proteids are colloids, and pass with difficulty, if at all, through animal membranes. Some animal proteids like haemoglobins are crystallizable. A considerable number of crystallizable proteids have been prepared from seeds, nuts, etc., by Osborne and his associates and others. As regards the action of proteids on polarized light, all the proteids are levorotary, the amount of rotation varying with the different kinds.

There are several color reactions characteristic of proteids. Some of the principal ones follow: With strong nitric acid, the proteids when heated to boiling give yellow flakes or a yellow solution, this being known as the xanthoproteic reaction. When a proteid in the solid state or in solution is boiled with a solution of mercuric nitrate in nitric acid containing some nitrous acid (Millon's reagent) a red coloration is produced. This and the former reaction depend on the presence of an aromatic radicle in the proteid molecule. On treating a proteid substance with a little sugar and some strong sulphuric acid a red coloration is produced. On adding to a solution of a proteid body some caustic potash and then a few drops of a very dilute solution of copper sulphate a violet blue color is obtained (biuret reaction). Peptones and albumoses behave somewhat differently, giving a rose-red color instead of violet if only a trace of copper sulphate is used. After being boiled with alcohol and washed with ether, and dissolved in strong hydrochloric acid, proteids give a blue coloration.

Proteids are precipitated by a great many reagents, the peptones and albumoses being excepted in a number of cases. Thus solutions of proteids are precipitated (1) by strong acids as nitric; (2) by picric acid; (3) by acetic acid and potassium ferrocyanide; (4) by acetic acid and excess of neutral salts like sodium phosphate; (5) by salts of heavy metals, as copper sulphate; (6) by tannin; (7) by alcohol; (8) and by saturation with some neutral salts, as ammonium sulphate. When proteids unite with mineral substances the resulting bodies are called albuminates; thus the precipitate formed when copper sulphate is added to a solution of albumin is copper albuminate.

Precipitation should be distinguished from coagulation. The latter term applies when an insoluble or coagulated proteid is formed from a

soluble proteid, which may be brought about (1) by heat; (2) by ferments, as for instance when milk is coagulated by rennet; (3) and when an insoluble proteid is produced by certain reagents, as nitric acid. There are precipitants of proteids which give a precipitate readily soluble in suitable reagents, as saline solution. In such cases the dissolved proteid continues to show its typical reactions.

PROTELES. See **AARD-WOLF**.

PROTEROGLYPHA (Neo-Lat. nom. pl., from πρότερος, *proteros*, fore, comp. of πρό, *pro*, before + γλύφειν, *glyphein*, to carve). A section of the great group of colubrine serpents including those in which the anterior maxillary teeth are so deeply grooved as to appear tubular, and which form enlarged 'fangs' for the conveyance of poison into the wound made by their bite. (Compare **OPISTHOGLYPHA**.) All are extremely poisonous, most are viviparous, and they are distributed throughout all the warmer parts of the world, except Madagascar and New Zealand. Boulenger and other recent authorities make the group include the colubrine cobras and coral-snakes (Elapinae); the sea-snakes (Hydrophinae); the Amblycephalidae; and the vipers and rattlesnakes (Viperidae).

PROTESILAUS (Lat., from Gk. Προτεσίλαος). A legendary King of Phylace, in Thessaly, son of Jason, and brother of Podarees. Protesilaus married Laodamia, and soon after sailed with the other Greeks to the Trojan War. According to the story, he was the first Greek to spring on shore, and also the first to fall by the hand of Hector. His young wife, Laodamia, overwhelmed with grief at the news, besought the gods that he might return, if for only three hours. Her prayer was granted; Hermes led Protesilaus back to earth, and when the allotted time had passed Laodamia slew herself that she might not again be separated from her husband. According to another version, which seems to have been followed by Euripides in a lost tragedy, Laodamia made an image of her husband and lavished affection on it. Her father, Acastus, sought to take it from her. Protesilaus, probably at his own prayer, returned for a brief space from the lower world, and Laodamia, as in the other story, accompanied him on his return. The legend is represented on several sarcophagi. There was a tomb and sacred precinct of Protesilaus at Elaios on the extremity of the Thracian Chersonese, and apparently an oracle connected with it. In Thessaly also a festival called the Protesilaia was celebrated with athletic contests.

PROTEST (from Lat. *protestari*, *protestare*, to declare publicly, bear witness, from *pro*, before, for + *testari*, to bear witness, from *testis*, witness), **CERTIFICATE OF**. A formal document by a notary public, or other duly authorized person, attesting the truth of some statement of fact, therein contained. It makes its appearance, at times, in shipping (q.v.) transactions, when it contains a statement on behalf of the master of

accidents, or injury, or breaches of duty by charterers or consignees, causing delay or damage to the ship; or a statement by the shipper against the master for misconduct, or delay or refusal to sign customary bills of lading. It is most frequently employed, however, in connection with negotiable paper, for the purpose of affording inexpensive evidence that the paper therein described has been duly dishonored. The law merchant, as it has been understood in England and in this country, requires a protest only in case of a foreign bill of exchange. By modern statutes, however, it is authorized and the fees and expenses thereof are collectible, in the case of an inland bill, check, or promissory note. The protest is to be made by a notary public under his hand and official seal; or by a respectable resident of the place where the instrument is dishonored, in the presence of two or more creditable witnesses. On the day of dishonor, the notary should make a memorandum of the fact that the paper has been duly presented and dishonored. This is termed 'noting.' At his convenience thereafter, he may extend the protest; that is, draw up, sign, and seal the formal certificate. This document must specify: (1) the time and place of presentment; (2) the fact that presentment was made and the manner thereof; (3) the cause or reason for protesting the bill; (4) the demand made and the answer given, if any, or the fact that the drawer, or acceptor, or maker could not be found.

The term 'protest' is often used to designate all of the proceedings which are necessary to fix the liability of a drawer or indorser. In this sense, it includes the notice of dishonor. As a technical term of the law of negotiable paper, however, it is limited to its original signification of a document prepared to bear witness to (*protestari*) the fact of dishonor. Consult: Brooke, *Treatise on the Office and Practice of a Notary of England* (London, 1901); Daniels, *A Treatise on the Law of Negotiable Instruments* (New York, 1903).

PROTESTANT EPISCOPAL CHURCH.

See **EPISCOPAL CHURCH**.

PROTESTANTISM. A term which has become a general designation for the system adopted by the Reformers in the sixteenth century and followed by their successors in later times. The name Protestant was first applied to the adherents of Luther, from their protesting against the decree passed by the Catholic States at the second diet of Speyer in 1529. This decree had forbidden any further innovations in religion and enjoined those States that had adopted the new principles so far to retrace their steps as to reintroduce the mass, order their ministers to avoid disputed questions, and use and explain the Scriptures only as they had hitherto been used and explained in the Church. The essential principles involved in the protest, and in the arguments on which it was grounded, were: (1) that the Roman Catholic Church cannot be the judge of the reformed churches, which are no longer in communion with her; (2) that the authority of the Bible is supreme, and above that of councils and bishops; (3) that the Bible is not to be interpreted and used according to tradition or use and wont, but to be explained by means of itself—its own language and connection. As this doctrine, that the Bible, explained independently of all external tradition, is the sole authority in

all matters of faith and discipline, is really the foundation stone of the Reformation, the term Protestant was extended from those who signed the Speyer protest to all who embraced the fundamental principle involved in it. The essence of Protestantism, therefore, does not consist in holding any special system of doctrines and discipline, but in the source from which and the way in which it proposes to seek for the truth in all matters of faith and practice; and thus a Church might, in the progress of research, see reason to depart from special points of its hitherto received creed, without thereby ceasing to be Protestant. The symbols or confessions of the Protestant churches were not intended as rules of faith for all time, but as expressions of what was then believed to be the sense of Scripture. When, at a later time, it was sought to erect them into unchangeable standards of true doctrine, this was a renunciation of the first principle of Protestantism, and a return to the Catholic principle; for, in making the sense put upon Scripture by the Reformers the standard of truth, all further investigation of Scripture is arrested, the authority of the reformers is set above that of the Bible, and a new tradition of dogmas and interpretation is created which differs from the Catholic tradition only in beginning with Luther and Calvin, instead of with the Apostolic Fathers. The *Protest* at Speyer has been translated in the "Historical Leaflets," published by Crozier Theological Seminary, Chester, Pa. (No. 1, 1901). See REFORMATION.

PROTEUS (Lat., from Gk. Πρωτεύς). In the Homeric poems, a prophetic 'old man of the sea' (*άλτιος γέρον, halties gerōn*) who tends the seal-flocks of Poseidon (Neptune), and has the gift of endless transformation. His favorite residence was the island of Pharos, off the mouth of the Nile; according to Vergil, the island of Carpathos (now Skarpanto), between Crete and Rhodes. Here he rose at midday from the floods, and slept in the shadow of the rocky shores, surrounded by the monsters of the deep. Here he must be sought, and captured by surprise, for he prophesied most unwillingly, and sought to escape by his power of transformation. If, however, his captor held him firmly in every shape, he resumed his original form and revealed the future unerringly. In Herodotus Proteus has become a King of Egypt, who received Paris and Helena, and retained the latter, while Paris took only a phantom with him to Troy. On the arrival of Menelaus in Egypt after the fall of Troy, Proteus restored to him his wife.

PROTEUS. A slender pennisbranchiate salamander (*Proteus anguinus*), called 'olin' by the Germans, which is closely related to the North American mud-puppy (q.v.), and is found in subterranean waters, in the absolutely dark limestone caverns of Carniola, Carinthia, and Dalmatia. Almost nothing is known of its habits. It is 10 or 12 inches long, seldom above half an inch in thickness, and pinkish-white with the gills carmine-red. Specimens have been kept alive in confinement for several years, in a darkened aquarium, apparently without food. It lays eggs, and fastens them singly to stones under water, and the larvæ nearly resemble the adults. Consult Gadow, *Amphibia and Reptiles* (London, 1901).

PROTEVANGELIUM OF JAMES. See APOCRYPHA.

PROTHALA'MION (Neo-Lat., from Gk. πρό, *pro*, before + θαλάμιος, *thalamios*, nuptial, from *θάλαμος, thalamos*, bridal chamber). A poem by Edmund Spenser (1596), written for the double marriage of Elizabeth and Catherine Somerset, daughters of the Earl of Worcester.

PROTHALLIUM, PROTHALLUS (Neo-Lat., from Lat., *pro*, before + *thallus*, from Gk. *θαλλός, young twig*). The sexual generation (gametophyte) of ferns; often extended to include the gametophytes of seed-plants. See PTERIDOPHYTES.

PROTHERO, prōth'e-rō', GEORGE WALTER (1848—). An English historian and biographer, born in Wiltshire, and educated at Eton, at King's College, Cambridge, and at the University of Bonn. He was tutor at King's and university lecturer in history from 1876 to 1894, professor of history at Edinburgh until 1899, and then editor of the *Quarterly Review*, on which he succeeded his brother. He wrote: *The Life and Times of Simon de Montfort* (1877) and a *Memoir of Henry Bradshaw*; edited *Select Statutes* from the reigns of Elizabeth and James I. (1894) and the *Growth of British Policy* (1895), by J. R. Seeley, whose life he wrote for the *Dictionary of National Biography*; and was editor of the *Cambridge Historical Series* and co-editor of the *Cambridge Modern History*.

PROTHERO, ROWLAND EDMUND (1852—). An English writer, born at Clifton-on-Teme, in Hampshire, September 6, 1852. He was educated at Marlborough School, and at Balliol College, Oxford, where he graduated with honors in both classics and modern history, and obtained a fellowship of All Souls' College (1875). From 1894 to 1899 he edited the *Quarterly Review*. His principal publications are: *Life and Correspondence of Dean Stanley* (1893); *Letters and Verses of Dean Stanley* (1895); *Letters of Edward Gibbon* (1896); *H. R. H. Prince Henry of Battenberg* (1897); *Life of Queen Victoria* (1897); and *Letters and Journals of Lord Byron* (1898-1900).

PROTHESIS. See ETYMOLOGY, FIGURES OF.

PROTHONOTARY WARBLER (OF. *prothonotaire*, Fr. *protonotaire*, from ML. *protonotarius*, chief notary, from Gk. *πρότος, protos*, first + Lat. *notarius*, notary, scribe, from *nota*, mark, from *noscere*, to know; ultimately connected with Eng. *know*). A wood-warbler (*Protonotaria citrea*) of the Mississippi Valley, from southern Illinois southward. It is rich yellow over the head and neck and lower parts, and olive green upon the back, wings, and tail, with the lining of the wings and the tail-coverts white. It is peculiar principally in nesting in holes in old trees.

PROTISTA (Neo-Lat. nom. pl., from Gk. *πρότιστος*, very first, superl. of *πρότος, protos*, first, from *πρό, pro*, before). A group-name proposed by Haeckel in 1878 for the lowest Protozoa and Prolophyta; it forms a neutral kingdom, containing the simplest plants and animals. Haeckel claims that the Protista show in their external form, structure, and vital phenomena such a remarkable mixture of animal and vegetable properties that they cannot justly be assigned to either the vegetable or animal kingdom. Haeckel's chief classes are the following, in the order given: *Monera*, including the bacteria, *Lobosa* (Amœba and allies), *Gregarina*, *Flagel-*

lata, *Catallacta*, *Ciliata* (Infusoria), *Acinetæ*, *Latymithuceæ*, *Bacillaræ* (Diatoms), *Fungi*, *Myxomycetes*, *Metamorphora* (Rhizopoda), *Heli-zoza*, and *Radiolaria*. This grouping satisfies neither the botanist nor the zoölogist, and has not generally been accepted by them. In fact, we should not expect the most primitive organisms to present clearly marked characters; they are undifferentiated forms with a common mode of reproduction.

PROTIUM, *prō'shī-ūm* (Neo-Lat., perhaps from a Javanese name), formerly called *ICICA*. A genus of pinnate-leaved trees of the natural order Burseraceæ, with white flowers in paniced racemes. *Protium Icariba*, a Brazilian species with fragrant resinous seeds, yields American elemi (q.v.); *Protium heptaphyllum* and *Protium Guianense*, natives of Guiana, yield fragrant balsams, which harden into a gray resin, used as incense in churches; *Protium altissimum*, another Guiana tree which attains a height of 100 feet, is used in house carpentry, canoe and furniture making. Its wood is known as white cedar, red cedar, acuyari, Samaria, Mara, and Curana wood.

PROTCERAS (Neo-Lat., from Gk. *πρῶτος*, *prōtos*, first + *κέρας*, *keras*, horn). A primitive ungulate found fossil in the White River beds of South Dakota. The animal was somewhat larger than a sheep and had a long narrow skull, armed in the male with two to six pairs of horns and in the female with one pair of small protuberances. The upper incisors are absent, the lower incisors well developed, and the upper canines of the

PROTCERAS SKULL.

male are much enlarged to form tusks. The ancestry and descendants of this animal are unknown and it constitutes a distinct isolated family remotely related to the modern chevrotains (*Tragulidæ*) of the Indo-Malayan region and West Africa. Consult Scott, "Osteology and Relationships of Protoceras," in *Journal of Morphology*, vol xi. (Chicago, 1895).

PROTOCOL (ML. *protocollum*, from MGk. *πρωτόκολλον*, *prōtokollon*, protocol, first leaf glued to a manuscript, from Gk. *πρῶτος*, *prōtos*, first + *κόλλα*, *kollan*, to glue, from *κόλλα*, *kolla*, glue). A term of diplomacy applied to the minutes or preliminary draft of an instrument or agreement between two or more States and intended to serve as the basis of negotiations for the conclusion of a definite treaty. The term is also applied to the formally authenticated minutes of the proceedings of a congress or conference, as where a number of friendly powers enter into a preliminary agreement to accomplish certain diplomatic ends by peaceful means.

PROTOGENES (Lat., from Gk. *Πρωτογένης*). A celebrated painter of ancient Greece who was

born at Caunus, in Caria, and practiced his art at Rhodes. He was a contemporary of Apelles, working in the latter part of the fourth century. Pliny, to whom we owe most of our information, says that when Demetrius Poliorcetes besieged Rhodes (n.c. 305-304) he took special care that the painter should be protected and undisturbed in his work. The ancient critics seem to have regarded his paintings as representing the highest art. They seem to have contained usually but few figures, and to have shown but little creative power. His strength lay in execution rather than composition. Besides his "Ialysus," a Rhodian hero, we hear of a "Satyr" resting with his pipes in his hand, the "Paralus and Ammonias" (the eponyms of the Athenian sacred triremes) in the Propylæa at Athens, which some took for Odysseus and Nausicaa, portraits of the mother of Aristotle, King Antigonus, Alexander with Pan, and the Thesmotheta, or the hall of the Athenian senate of five hundred.

PROTOGENESIS. See SPONTANEOUS GENERATION.

PROTOGINE (from Gk. *πρῶτος*, *prōtos*, first + *γίνεσθαι*, *ginesthai*, *γίνεσθαι*, *gignesthai*, to become). Granite (q.v.) of gneissic structure composed of quartz, feldspar, and a greenish micaceous mineral belonging to the sericite or chlorite families which latter covers the lamination surfaces in a more or less continuous wavy membrane. The name protogine is applied chiefly to a rock mass of the Alps and is little used to describe rocks in other regions.

PROTOHIPPIUS (Neo-Lat., from Gk. *πρῶτος*, *prōtos*, first + *ἵππος*, *hippos*, horse). An ancestor of the horse in the Miocene Period. See HORSE, FOSSIL.

PROTONOTARY (ML. *protonotarius*, chief notary). The name properly given to each of the seven members of the Roman College of Papal Notaries, made up of prelates. They make up the first class; besides there are honorary protonotaries, who constitute a second class. The office of notary is very ancient, indeed primitive, for according to the *Liber Pontificalis* Clement I. (91-100) appointed a notary for each two of the fourteen 'regions' of Rome, making seven in all, and these were the forerunners of the first class of Papal protonotaries, whose duties are fixed by the constitution *Apostolicæ Sedis Officium* issued by Pius IX. in 1872. The original notaries were shorthand writers, using the *notæ*, or characters, 1100 in number, invented, it is said, by Ennius, the Latin poet. Later notaries were simply secretaries.

PROTOPLASM (ML. *protoplasma*, from MGk. *πρωτόπλασμα*, first creation, from *πρῶτος*, *prōtos*, first + *πλάσμα*, *plasma*, creation, from *πλάσσειν*, *plassein*, to form). The living substance constituting the cells of plants and animals, or forming the bodies of all one-celled organisms. In appearance it is like thin syrup, filled with highly refractive microscopic granules. It forms the physical basis of life, no living being existing without it; and all the phenomena or activities of life are based on this fundamental substance.

CHEMICAL CONSTITUTION. Protoplasm largely consists of proteins, which are compounds of carbon, hydrogen, oxygen, nitrogen, and sulphur, associated with a large proportion of water. Be-

sides proteids protoplasm contains small proportions of mineral matters, especially phosphates and sulphates of potassium, calcium, and magnesium, as well as sodium, iron, phosphorus, and chlorine found in the ash. It is dissolved by prolonged treatment with weak acids or alkalis. Strong alcohol coagulates it, as does heat. Proteids are unstable, and protoplasm, especially that of animal cells, decomposes with more or less rapidity and gives out a fetid odor. Protoplasm readily stains by the application of neutral or slightly alkaline solutions of carmine, logwood, or acid aniline dyes (eosin and acid fuchsin). Thus by the use of a carmine stain the chromatin in cells is clearly demonstrated. Protoplasm is usually, but not always, alkaline in reaction; red litmus paper is turned blue by it. Protoplasm is evidently a highly complex substance, but it is not known whether it is a definite chemical body, or whether it is a varying mixture of different chemical substances. "Protoplasm," says Hertwig, "is not a chemical, but a morphological conception," and the present organization of protoplasm is "the result of an exceedingly long process of development." For remarks upon the origin of protoplasm, see SPONTANEOUS GENERATION.

GENERAL PROPERTIES OF PROTOPLASM. If we watch an amœba under the microscope we gather that protoplasm first of all is contractile and irritable; that it assimilates its food, and is capable of excreting the waste residue; that it even respire, while it reproduces true to its species by self-division. Under a high power of the microscope the protoplasm of the egg of a starfish or sea-urchin, says Wilson, gives the appearance of a fine meshwork or framework composed of innumerable minute granules, or microsomes, suspended in a clearer, less deeply staining, continuous substance. The spaces of the meshwork (filar substance, spongioplasm, cell-reticulum) are filled with a clear, homogeneous substance, not staining readily, and called the ground-substance (interfilar substance, euchylema).

MOVEMENT AND IRRITABILITY OF PROTOPLASM. This consists of the changes in the form of the body, e.g. of the amœba, or of the white blood-corpuscles (leucocytes), whence such movements are called 'amœboid;' while in the interior streams of granules are seen passing along the body and in the pseudopods. That irritability exists is proved by many facts, as that amœboid movements and the flow of granules can be induced, stopped, or modified by mechanical, chemical, and thermal stimuli.

NUTRITION AND ASSIMILATION. Irritability and the power of motion are essential in bringing about assimilation, which is the change of food substance into protoplasm. Most unicellular animals, as well as the white amœboid blood-corpuscles, and certain cells in sponges, cœlenterates, etc., have been observed to take in or devour solid substances. They take the particles of food into the midst of the protoplasm of their bodies by flowing around them; they extract all the assimilable and reject the indigestible portions. (See AMœBA.) Many Protozoa (q.v.), besides taking in food for their own growth and for replacing worn-out parts, have the power of producing substances, such as lime or silica, or in rare cases cellulose, forming hard coverings or shells, often many-chambered and wonderfully

complex, as well as frequently richly ornamented. This formative power, says Hertwig, is the starting point in the formation of tissue.

HISTORY OF THE DISCOVERY OF PROTOPLASM. In the eighteenth century Corti (1772) and later Treviranus (1807) had seen that the grains of chlorophyll which cause the green color of plants flow rapidly in the interior of cells of certain plants. Mohl discovered that this apparent motion of the chlorophyll grains was due to that of the substance in which they were contained. This substance Mohl in 1846 called 'protoplasm,' while several observers (Siebold, Kölliker, Remak, etc.) afterwards discovered movements similar to those seen in vegetable protoplasm in the lymph corpuscles of animals, and therefore Remak applied the same term 'protoplasm' to the fundamental substance of animal cells. Meanwhile further knowledge of protoplasm was obtained by the study of certain Protozoa, and Dujardin in 1835 applied the name 'sarcode' to the gelatinous granular contractile substance forming their bodies. Ferdinand Cohn in 1850 argued for the identity of 'sarcode' and 'protoplasm.' Finally Max Schultze in 1861, and De Bary, as the result of prolonged investigations, proved the identity of the protoplasm of plants and animals with the sarcode of the Protozoa. Afterwards the cell membrane was found by Nägeli, Leydig, Kölliker, Cohn, etc., to be of minor importance, the protoplasm being the essential, dynamic substance of the cell.

PROTOROHIPPUS (Neo-Lat., from Gk. *πρότος*, *prōtos*, first + *ἵππος*, *oros*, mountain + *ἵππος*, *hippos*, horse). An ancestor of the horse in the Middle Eocene Period. See HORSE, FOSSIL.

PROTOROSAURI. See PROSAURIA.

PROTOSPONGIA (Neo-Lat., from Gk. *πρότος*, *prōtos*, first + *σπोंγγια*, *spongia*, sponge). One of the earliest, if not the earliest, fossil sponges known. It consisted of a spherical body which now appears as a faint disk upon the surface of the rock, with the skeleton showing as a regular network of cross-shaped spicules that form square meshes. It is found in the Cambrian formations of North America and Europe.

PROTOTHERIA (Neo-Lat. nom. pl., from Gk. *πρότος*, *prōtos*, first + *θηρίον*, *thērion*, diminutive of *θήρ*, *thēr*, wild beast). The lesser and inferior of the two primary divisions of the Mammalia. It embraces only the small group represented at present by the Australian and Papuan egg-laying duckbill and echidnas, which constitute the order Monotremata (or Ornithodelphia); and possibly also the doubtful and little-known fossil group termed Allotheria or Multituberculata. The mammalian affinities of these extinct forms have been denied by some paleontologists, but the weight of opinion views them as properly included in that category. Both externally and internally the monotremes show much that is distinctly mammalian, including the character of the brain, which in the echidnas at least is surprisingly large and well convoluted. The absence of a corpus callosum is the chief peculiarity differentiating it from the eutherian

brain. The skeleton exhibits many archaic features, one of the most striking of which is the presence of only the capitular head to the ribs. The shoulder girdle has other reptilian features, and a bone (the interclavicle) peculiar to the group. The digestive and circulatory systems differ little from the normal mammalian type, and the great distinction between the Prototheria and other mammals lies in the reproductive system, and the fact that their eggs, instead of being minute and with little or no food-yolk, are large, contain much yolk, and therefore develop, so far as their early stages are concerned, after the meroblastic manner of a reptile's egg. The Prototheria have a temporary ventral 'mammary' pouch in which the young are hatched, or to which they are transferred after hatching, and into which open the ducts of the mammary glands. This pouch is formed by a deep fold of the skin periodically developed in preparation for the young, and contains no teats, but nutrition is supplied by modified sweat-glands. Its homologies are fully discussed by Beddard (*Mammalia*, 1902), who refers to the work and writings of many investigators. See DUCKBILL; ECHIDNA; MAMMALIA.

PROTOZOA (Neo-Lat. nom. pl., from Gk. *πρωτος*, *prōtos*, first + *ζῷον*, *zōon*, animal). The subkingdom or phylum of one-celled animals, represented by the amoeba (q.v.), infusoria, and the like. They are, as a rule, of microscopic size, and are like particles of protoplasm (q.v.), having a gliding motion and constantly changing their form. Protozoa consist of a single cell, and, with the exception of the moners (q.v.), they possess one or more nuclei, but no other organs or true tissues. As the entire body is composed of protoplasm, the simplest protozoan is contractile, absorbs and digests food, is metabolic, automatic, and reproduces by self-division. Motion is not only brought about by the general contraction of the body, but by means of 'pseudopodia' (see AMOEBIA), cilia, and a specialized cilium called 'flagellum,' while in the most specialized infusoria, such as Vorticella and Stentor, little muscular fibrillae have been detected. Besides the nucleus and food-vacuoles, there are other cell-organs called 'contractile vacuoles,' which occur in fresh-water forms and only rarely in marine species. They apparently perform an excretory function, and may be respiratory, since they are supposed to eliminate carbon dioxide. All the vital functions appear to be under the control of the nucleus. Protozoa reproduce by self-division or budding, or they conjugate, multiplying by spores or germs. (See REPRODUCTION; SEX.) They may be naked, or secrete a calcareous shell, consisting of one, two, three, or many chambers; in the latter case (the Foraminifera), the shell is remarkably complex, considering the great simplicity of the animal itself. Apparently the same mechanical laws guide the mode of shell-formation, the chambered shells being irregular, or straight, or twisted, or coiled in a single plane, like the chambered nautilus. While a very few forms are terrestrial (*Amoeba terricola*), the vast majority are marine and fresh-water forms, the shelled forms being marine. The fresh-water forms abound most in still or stagnant water, and may become encysted when the water dries up, or when food is lacking or cold approaches. Thus protected by a

thin resistant outer covering, the monads and infusorians in general may dry up and be blown about by the winds, remaining suspended in the air for a long period. In this way the species have become more or less cosmopolitan. A large proportion of American forms are of the same species as those of Europe.

The discoverer of the microscope, Leeuwenhoek (q.v.), in 1764 first detected and described certain forms living in infusions, and about the same date Wrisberg (*Observationes de Animalculis Infusorius*, Göttingen, 1765) called them 'infusorial animalcules.' The name Protozoa was given in 1845 to the subkingdom by Siebold, who discovered that they were unicellular, disproving Ehrenberg's claim that they possessed a digestive canal, nervous system, muscles, excretory and sexual organs. The earliest traces of shelled Protozoa are those of Globigerina and Orbulina detected by Matthews in the Lower Cambrian rocks of Saint John, N. B.

It is to be observed that if we detect the remains of shelled Protozoa in the Cambrian formation, it is safe to suppose that the seas and fresh waters of that early period harbored numerous soft-bodied or shell-less forms. It is also supposed that the present types of Protozoa are very early forms which have persisted from Cambrian times, the type having undergone but little specialization. The Radiolaria date from the Cambrian. See FORAMINIFERA; RADIOLARIA.

CLASSIFICATION. The phylum Protozoa is divided into five classes: (1) *Rhizopoda*; (2) *Mycetozoa*; (3) *Flagellata* (*Mastigophora*); (4) *Sporozoa*; and (5) *Infusoria*. Of these the Sporozoa are all parasitic, while the malarial germ is a protozoan of doubtful position, its young being provided with flagella.

The latest work is Lankester, *A Treatise in Zoölogy*, part i. (London, 1903), which contains a bibliography.

PROTRACTOR (ML. *protractor*, from Lat. *protrahere*, to draw forward, from *pro*, before, for + *trahere*, to drag, draw). An instrument used for measuring and laying down angles on paper. In its simplest form it consists merely of a semicircular scale of metal or transparent material. The three-arm protractor used in marine surveying is used to solve mechanically the 'three-point problem.' The middle arm is fixed with its reading edge at the zero of the scale; the other arms, pivoting at the centre of the instrument, are arranged to measure angles on each side of the middle arm and all carry verniers. The method of using the protractor is as follows: Three objects (whose positions are marked on the chart or map) are selected. The angle between the right and centre objects and that between the centre and left are measured with sextants or similar instruments. The angles so obtained are transferred to the protractor, which is then laid upon the chart, and, with the edge of the centre arm always kept on the marked position of the centre object, the instrument is slipped along until the side arms fall upon the positions of the other two. The centre of the protractor then indicates the position occupied by the observer when the angles were taken, and crossed wires, a hole in a glass-ended tube, or a needle point serves to fix this position, which, if the angles are simultaneously observed, can be accurately ascertained even when the surveying boat is moving at a higher

rate of speed than is consistent with obtaining correct soundings. In selecting the point of observation care should be taken that the angles exceed 30 degrees if possible, and that the point occupied is not near the circumference of the

THREE-ARM PROTRACTOR.

circle which passes through the points observed. If the angles are small, a slight error in them is likely to produce a large error in the resulting position; and if the point occupied is on the circle passing through the three observed, its position is indeterminate.

PROU, **prō**, **MAURICE** (1861—). A French historian, born at Sens and educated in Paris, in the Ecole des Chartes and the Ecole des Hautes Etudes. After some time at the French School at Rome, Prou entered the numismatic museum of the National Library, and became professor of diplomatic relations at the Ecole des Chartes in 1900. He edited *Le moyen âge* (1893 et seq.). Besides editions of Hinemar (1884) and of Honorius's registers, his most important works are: *Raoul Glaber* (1886); *Manuel de paléographie* (1889; plates 1892 and 1896); *Catalogue des monnaies françaises* (1892 et seq.); and *La Gaule mérovingienne* (n. d.).

PROUD, **ROBERT** (1728-1813). An American historian. He was born in Yorkshire, England, but emigrated to America and settled in Pennsylvania in 1759. For many years he was a teacher of Greek and Latin in a Friends' academy at Philadelphia. Proud is chiefly noteworthy for his having written *The History of Pennsylvania in North America, from the Original Institution of that Province, under the First Proprietor and Governor, William Penn, in 1681, till after the year 1742*. He wrote the work principally during the period of the Revolution, with which he was not in sympathy, and published it in two volumes in 1797-98. The work contains original material that is of value to the student. Consult Thomson, in "Notices of the Life and Character of Robert Proud," in *Memoirs of the Historical Society of Pennsylvania*, vol. i. (Philadelphia, 1826 and 1864).

PROUD FLESH. The popular term for exuberant granulations (q.v.) springing up in wounds or on ulcerated surfaces. Such granulations must be treated with nitrate of silver or sulphate of copper, either in the solid form or in strong solution. See **LUNAR CAUSTIC**.

PROUDHON, **prō'dōn'**, **PIERRE JOSEPH** (1809-65). A noted French socialist and political writer, born at Besançon, July 15, 1809. He was educated at the College of Besançon, where he proved himself an able student; but on account of the poverty of his parents he was compelled to leave before receiving his degree. In 1828 he obtained employment in a large printing establishment in his native city, and after eight years he set up one of his own, which was not successful. In 1838 he published his *Essai de grammaire générale*, which secured him a triennial pension of 1500 francs from the Academy of Besançon. In the same year he removed to Paris. Here in 1840 he published *Qu'est-ce que la propriété?* (translated by Tucker, Philadelphia, 1888, in which he sums up his doctrines in the celebrated dictum, *La propriété c'est le vol*). At the moment of publication the work attracted little notice, and the sole results to its author were the withdrawal of his pension by the Academy, on the score of his noxious opinions, and the threat of prosecution. In 1842, for a repetition of the offense in his *Avertissement aux propriétaires*, he was prosecuted before the Cour d'Assises of Besançon, but succeeded in obtaining an acquittal. From 1844 to 1847 Proudhon was employed at Lyons in the superintendence of a scheme of water transport on the rivers Saône and Rhône, publishing during this time at Paris the two works entitled *De la création de l'ordre dans l'humanité* and *Système des contradictions économiques*. On the outbreak of the Revolution of February, 1848, Proudhon repaired to Paris, and on April 1st came before the public as editor of the *Représentant du Peuple*. By his vigorous advocacy of extreme democratic and socialistic opinions, he became one of the leading figures of the hour. His paper was suppressed in August; but meantime, on June 4th, he had been elected to the Constituent Assembly as representative of the Department of the Seine. In that body he had comparatively little influence; he attached himself to no political party, but attacked the radical Left and the reactionary Right with equal bitterness. His importance as a writer was much greater, and as editor of three daily journals in succession he had great influence upon the political movements. All three papers were in turn suppressed as anarchistic and obnoxious—*Le Peuple* (November 23, 1848-April, 1849), *La Voix du Peuple* (October, 1849-May, 1850), *Le Peuple de 1850* (June 15th-October 13th). During their continuance Proudhon was repeatedly subjected to fines, which were defrayed for him by popular subscription. In January, 1849, he attempted to put his theories into practice by the institution of a People's Bank. The bank was closed by the authorities, and its originator fled to Geneva to escape threatened imprisonment. In June, however, he returned, and his next three years were passed in the prison of Saint Pélagie. While confined there he married. In June, 1852, he was set at liberty, and, quitting Paris, went to Belgium, where he continued to publish from

time to time on his favorite subjects. He returned to Paris after the amnesty of 1860 and died at Passy, January 16, 1865.

Proudhon's theories are best set forth in his works *Qu'est-ce que la propriété?* and *Système des contradictions économiques*. Property, he declared, is unjustifiable either on the ground of occupation, which can entitle the possessor only to the usufruct, or on the ground of labor, which presupposes occupation. The individual has a right only to the integral product of his labor. One service can only be duly repaid by rendering another; but the owners of land and capital exact many services while rendering none. Society should suppress interest and rent, to which there can be no just claim.

His political programme was equally revolutionary. He was the founder of a school of individualistic or philosophical anarchy. He declared that the State, representing unintelligent conservatism or brutal reaction, must be suppressed. The revolution for the betterment of humanity must come, not from above, through the Government, but from below, through the individual. The indispensable condition of reform is the suppression of government.

In the history of French thought and socialism Proudhon occupies an important position. His destructive criticism was of value; but he also elaborated numerous propositions which are regarded as positive acquisitions by economists and socialists. He gave to federalism and anarchy a doctrine; he conceived of a democratic organization of credit; he outlined the socialistic theories of value, of rent, and of the right of the laborer to the whole product of his labor. His theories were of great influence upon three important movements—the Revolution of 1848, the Commune of 1870 (many of the principal actors in which held his opinions), and the International Workingmen's Association. Moreover, many organizations of workingmen, especially in France, still look for their intellectual leadership to Proudhon. Among his works, in addition to those already mentioned, are: *Explications présentées au ministère public sur le droit de propriété* (1842); *Solution du problème social* (1848); *Banque du peuple* (1849); *Actes de la révolution: résistance* (1849); *Les confessions d'un révolutionnaire* (1849); *Intérêt et capital* (1850); *Idee générale de la révolution au XIXème siècle* (1851); *Philosophie du progrès* (1853); *La guerre et la paix* (1861); *De la capacité politique des classes ouvrières* (1865).

PROUST, πρῶ, ANTONIN (1832—). A French politician and author, who sometimes wrote under the pseudonym of Antoine Barthélemy. He was born in Niort, and, after an excellent education and travels in Greece, entered journalism, and in 1864 founded at Brussels *La Semaine Universelle*, in which he bitterly opposed the Empire. Proust became Gambetta's private secretary after the fall of the Empire, and was elected Deputy in 1876 and repeatedly re-elected. From November, 1881, to January, 1882,

he was Minister of Fine Arts under Gambetta. The Museum of Decorative Arts was largely due to his efforts. He was the Commissioner-General of Fine Arts at the Exposition of 1889, and French Commissioner-General to the World's Columbian Exposition of 1893. His chief works are: *Les beaux-arts en Angleterre* (1862); *Un philosophe en voyage* (1864); *Chants populaires de la Grèce moderne* (1866); *La démocratie en Allemagne* (1872); *Le prince de Bismarck* (1876); *L'art français* (1890); *L'art sous la république* (1891); and critiques of the Salons of 1898 and 1899.

PROUST, JOSEPH LOUIS (1754-1826). A French chemist, born at Angers. He studied chemistry there and in Paris, and became chief apothecary to the Salpêtrière. He put on a firm basis the chemical law of definite proportions, sometimes called Proust's law; discovered glucose (1799); and in general greatly advanced the knowledge of quantitative analysis.

PROUSTITE (named in honor of Joseph Louis Proust). A mineral sulphide of silver and arsenic that crystallizes in the hexagonal system. It has an adamantine lustre and a bright red color. It is found in Saxony, Bohemia, Spain, Mexico, South America, and in the United States at various localities in Colorado, Arizona, and Nevada, in association with silver ores.

PROUT, EBENEZER (1835—). An English theorist and composer, born at Oundle, Northamptonshire. His father sent him to London University, where he graduated in 1854. He had but little instruction in music during his boyhood, with the exception of a course under Charles Salaman, but he showed such aptitude for the art that in 1859 he devoted himself to it. In 1861 he became organist at Union Chapel, Islington. In 1894 he was appointed professor of music at Dublin University, having occupied in the meantime the positions of professor of pianoforte at the Crystal Palace School of Art, professor of harmony and composition at the National Training School, and critic on the *Academy and Athenæum*. He took Sullivan's class at the Royal Academy of Music in 1879; was conductor of the Hackney Choral Association, which he succeeded in bringing to a high degree of efficiency; and was editor of the *Musical Record* from 1871 to 1874. His valuable theoretical works are: *Primer of Instrumentation* (1876); *Harmony: Its Theory and Practice* (1889); *Counterpoint: Strict and Free* (1890); *Double Counterpoint and Canon* (1891); *Fugue* (1891); *Applied Forms* (1895); and *The Orchestra* (1898-99). His compositions include four symphonies, two overtures, and many choruses, psalms, chamber-music, and instrumental selections. His cantatas are: *Hereward* (1878); *Alfred* (1882); *The Red Cross Knight* (1887); *Damon and Phintias* (1889); and *Queen Aimée* (1885).

PROUT, FATHER. See MAHONY, FRANCIS SYLVESTER.

PROUT, SAMUEL (1783-1852). An English landscape and architectural painter in water-color, born at Plymouth. His real artistic activity began in 1818 with his travels on the Continent, which were continued throughout his career, and furnished materials for his best aquarelles. Especially well known are his archi-

tektural drawings of old Normandy. Many of his drawings were afterwards lithographed and published in volumes, under the titles, *Facsimiles of Sketches Made in France and Germany* (1833); *Interiors and Exteriors* (1834); *Sketches in France, Switzerland, and Italy* (1839), etc. He was also well known as the author of numerous elementary drawing-books, including *Bits for Beginners*; *Hints on Light and Shade, Composition, etc.* His water-color drawings are characterized by decision of handling, great breadth, and clear and pleasing coloring.

PROVENÇAL (prô'vân'sâl') LANGUAGE.

A family of Romance dialects spoken in Provence (and neighboring districts), or that part of Southern France in which was the Roman province called Provincia. It was with French the first Romance tongue to win importance in literature. Its literary vogue decayed after the period of the Albigensian Crusade (1209-1229), but in modern times it has been rather successfully applied to literary purposes again by Mistral (q.v.) and other writers. From French, its northern neighbor, Provençal is separated geographically by a line which, starting from the mouth of the Gironde, follows the Dordogne for a while, then ascends to the north toward Isle-Jourdain, and, bending to the east as far as Montluçon, descends again in a southerly direction, crosses the Rhone, passes through the regions of Lyonnais and Dauphiné, and reaches the Alps. This line of demarcation serves also to divide it on the northeast from a linguistic territory known as the Franco-Provençal, because it has peculiarities savoring both of French and Provençal. In the southwest of the territory to the south of the dividing line described is found a body of Gascon dialects, which in the Middle Ages were treated as forming a speech foreign to Provençal. The number of persons speaking the modern Provençal dialects (including Gascon) may be estimated at about 8,000,000. Provençal has often been called the *langue d'oc*, as contrasted with French, called the *langue d'oïl*; *oc* and *oïl* were respectively the Provençal and the Old French words for 'yes.'

The older speech, as represented in the literary works of the twelfth century, had eight simple vowels, viz. open and close varieties of *a*, of *e*, and of *o*, the high front vowel *i*, and a rounded form of this last vowel, written *u* as in modern French. Among the more common diphthongs were *ie*, *uo*, *ue*, and *au*. The retention of the Latin diphthong *au* is a characteristic of Provençal as compared with the other Romance tongues. The consonantal sounds comprised the velar stops *k* (written *c* before *a*, *o*, and *u*, and at the end of a word, as in *car*, 'why,' *cort*, 'court,' and *qu*, as in *que*, 'that,' and *quina*, 'fifth'), and *g* (written *gu* or more usually *g* before *a*, *o*, as in *garvir*, *guarvir*, 'to furnish,' *g* before *u*, as in *agur*, 'augury,' and *gu* before *e*, *i*, as in *guerra*, 'war'); the velar nasal with a value like that of the English *ng* in 'ring' (written *n* before the *k* and *g* sounds already described, as in *tenc*, 'he held'); the dental stops *t* and *d*, the former voiceless, the latter voiced; the voiceless sibilant *s* (written *s* and *ss*, the latter usually between vowels, as in *baissar*, 'to lower'); the voiced sibilant *z* (written *z* or *s*, as in *chauza* or *chausa*); the dental spirant *th* (*th* of English 'there;,' written *d*, and after the

middle of the twelfth century *z*, when it probably already denoted the *z* sound, as in *espaza*, 'sword'); the dental nasal *n*; the palatalized *n* (written *n*, *ign*, etc., and more commonly in later times *nh*, as in *renkur*, 'to reign'); a well-pronounced *r*; an *l*; a palatalized *l* (written *lh* or *ill*, as in *acolhir*, *acoillir*, 'to welcome'); the labial stops *p* (voiceless) and *b* (voiced); the labio-dental spirants *f* (voiceless) and *v* (voiced); the labial nasal *m*; the semivowels *y*, *u*, *ü* (represented by *i*, by *ou*, and by *u*, when they stood in hiatus). More complex sounds are *tš* (the English *ch* of 'church,' i.e. a voiceless dental sibilant, represented by *ch* in all positions, and by *g* occasionally in the final position, as in *sapcha*, 'let him know,' *tug* or *tuich*, 'all'); *dž*, the voiced equivalent of the preceding sound (the English *j*, represented by *j* and, before *e* or *i*, by *g*, as in *gen*, 'gentle,' *joytur*, 'minstrel'); the manuscripts often have graphic *i* for *j*); a voiceless dental sibilant *ts* (written *c*, as in *marce*, and *z* or *tz*, especially in the final position, as in *faz*, *fatz*, 'he does'); and a voiced dental sibilant *dz* (written *z*, as in *dizem*, 'we say'); as in French, the last two sounds soon lost their dental component. In the literary documents final *n* is often omitted, and, on the other hand, it is often added to words that should normally end in a vowel; this ease of addition or omission has led to its being called the movable *n*. Even in the earliest times the Provençal region was divided into a northern and a southern linguistic district, the northern marked by the change of initial Latin *ca-* to *cha-* (*chastel*, 'castle'), the southern by the retention of the *k* sound (*castel*) of the *ca-*.

What most distinguishes Provençal as compared with French is the fact that it keeps the Latin accented *a* of free syllables and Latin unaccented final *a*, while French has changed them respectively to *é* and slurred or mute *e* (cf. Provençal *amat* and Old French *amét*, modern French *aimé*; Provençal *bona* and French *bonne*). In modern Provençal the final unaccented *a* has become *o*, and palatalized *l* has tended to become the palatal semivowel *y* as in French. Nasalization of vowels has not at any time been a regular feature of the language. The word-accent has always fallen on the last or the next to the last syllable. In the older period there was a ease distinction of nominative and accusative for substantives, except those coming from the Latin first declension; thus, nominative singular *sor*, 'sister,' accusative singular *seror*, nominative plural *scrors*, accusative plural *scrors*; nominative singular *cavaliers*, 'knight,' accusative singular *cavalier*, nominative plural *caralier*, accusative plural *cavaliers*; but nominative and accusative singular *domna*, 'lady,' nominative and accusative plural *domnas*. In the modern speech the plural sign *s* is silent except in liaison. The four conjugations of Latin persisted in Provençal; but only the first (infinitive in *-ar*) and the fourth (infinitive in *-ir*) remained with sufficient vitality to attract new verbs to them. As in the earliest Old French, and as occasionally even nowadays in Spanish and Portuguese, the Latin pluperfect indicative (*cantaveram*, etc.) had in early documents an indicative value (either pluperfect or aorist, usually the latter); it had oftener, however, the imperfect subjunctive or conditional force that has prevailed also in the Iberian Peninsula.

PROVENÇAL LITERATURE. The literature written in the various dialects of the south of France, and more particularly that written during the Middle Ages in the dialect of Limousin. Its earliest monument, a fragment of a moral poem called *Boëthius*, belongs to the first half of the eleventh century. The courtly lyrics, however, which constitute its main glory, were nearly all written between 1090 and 1350. The songs of over four hundred poets who composed during this period have come down to us, and we know the names of almost seventy others whose works have perished. Among these authors we find not only wandering singers and court minstrels, but knights, ladies, barons, counts, and even kings. The amenity of the climate, the refinement of manners, the frequency of travelers, merchants, and pilgrims, the blithe and easy life in rich cities and baronial palaces, favored the development of a form of poetry which found its inspiration and its support in a luxurious and frivolous aristocratic society. The troubadours (q.v.) wrote, not for readers, but for hearers; their pieces were sung at court festivals either by the authors themselves or by the more humble jongleurs. Music and words were usually composed by the same person. This intimate connection between words and music strongly influenced the form of these lyrics. Elaborate artificiality is a predominant trait. Every variety of rhyming scheme was attempted, the rhymes of one stanza being repeated in all the others throughout a poem. Word-play, alliteration, conceits, and forced constructions

abound, and difficulties of every kind were sought. There even grew up a style called the *trobar clus*, or *oscur*, the chief merit of which was that it could hardly be understood. A treatise on verse written in the fourteenth century (*Leys d'Amors*) mentions many different kinds of poems, the most important of which are the *vers* and *canço*, the *sirventes* and the *tenso*. Between *vers* and *canço* no very clear distinction has been observed, except that the *vers* was the earlier and simpler form. The *canço* was an elaborate lyric of from five to seven stanzas with complicated rhymes, and it dealt always with love, and required a melody of its own. The sort of love thus treated was peculiar to the Middle Ages and seems to have been shaped by the social conditions of the period. The ladies who presided over the almost independent courts of Southern France were the natural subjects of the praise and adoration of the singers, who expressed largely a feigned passion in artificial formulas. Yet, however innocent for the most part these love affairs actually were, the semblance of an illicit relationship was preserved. In general, love is represented as the greatest good, the height of blessings, the source of all virtue and glory. Spring-time is its season; its cause, beauty which, penetrating the lover's eyes, smites his heart, within which it inflicts a wound that causes infinite suffering. Yet he dares not speak, though he grows pale and sleepless. Nothing can change his devotion and his absolute submission to his lady's will; for her noble qualities brighten the world and ennoble all who approach her. Her grace and mercy are his only hope. Such, in general, though played upon in every variety of style, sometimes even in parody, is the subject matter of the *canço*.

The *sirventes*, or service song, was written to fit some well-known and popular air. The subject was moral or religious, political or personal. The poet, with great freedom of language, scourges the vices of nobles or women or clergy, laments the decay of ancient manners and the growth of avarice, stimulates leaders and populace to war, exalts a patron for his political virtues and his generosity, avenges an injury by virulent personal invective, or exhorts laggards to the crusade. Without an intimate acquaintance with the events to which they relate, many of these pieces are now unintelligible, yet to the student of mediæval life they are most interesting; for they constitute the journalism of the age.

The *tenso*, with which may be included the *partimen*, *joes partitz*, and *torneyamen*, was a poetical dispute, a play of wit, in which, often with biting mockery and intense personal bitterness, two or more poets debated, in alternate stanzas, some question of love casuistry, such as: Which are the greater, the benefits or the ills of love? Which contribute more to keep a lover faithful, the eyes or the heart? The decision is commonly left to some lord or lady. Such were the leading artificial forms of the Provençal lyric. There were, however, some others which retain a stronger impress of popular origin: the *alba*, or dawn-song, portraying the parting of lovers; the *ballada*, *dansa*, and *ronda*, to be sung to the dance; the *pastorela*, copied some think from the French, a dialogue between a knight or a clerk and a shepherdess.

The earliest lyrical writer whose songs have been preserved is William IX., Duke of Aquit-

taine and Count of Poitou, but his pieces show such sure skill in treatment, such stability of language, metrical form and artistic character, as could not have been attained without the foundation of a considerable earlier literature. After the middle of the twelfth century the poets became numerous and their art soon reached its culmination. Among the most notable singers are: Marcabrun, distinguished for his biting satire; Jaufré Rudel, Prince of Blaia, hero of a romantic tale, charmingly dramatized by Edmond Rostand in his *Princesse lointaine*; Rambaut d'Orange, who exchanged love songs with Beatrice, Countess of Die; Peire Rogier, who excelled in exaggerated devotion to Ermengarde, the masculine Countess of Narbonne; Bernard de Ventadour, the greatest singer of love; Peire d'Alverhne, who wrote largely in the difficult style; Arnaut de Mareuil, referred to by Petrarch, in comparison with Arnaut Daniel, as 'the less famous Arnaut;' Guiraut de Borneil, 'the master of the troubadours;' Peire Vidal, an erratic genius; Bertran de Born, often called, on account of his stirring war songs, 'the Tyrtæus of Provence,' and put by Dante into hell among the stirrers of dissension (*Inf.* xxviii.); Folquet de Marseille, who sang of love in his youth, then entered the Church, rose to be Bishop of Toulouse, and was one of the most ferocious persecutors of the Albigenses; Pons de Capduell, Rambaut de Vaqueiras, and Peirol, all three lovers and crusaders; Arnaut Daniel, whom Dante met in the last circle of Purgatory, and whom he regards as the greatest of all poets of love (*Purg.* xxvi.); Raimon de Miraval, who sang light-heartedly of amorous intrigues while his country was being devastated by a cruel war and ruin stalked through the land.

After the beginning of the thirteenth century the Provençal lyric rapidly declined. Moral poems largely took the place of songs of love and war. Among the writers worthy of mention are: Aimeric de Peguilhan, the favorite of many nobles; Peire Cardinal, master of the moral *sirventes*; Sordello, the Mantuan, made famous by Dante and Browning; and Guiraut Riquier, who may well be regarded as the last of the Troubadours.

The fall of this brilliant literature began with the Albigensian Crusade of 1209, which soon turned into a savage war of conquest, and ended in the absorption of the fiefs of the south by the French monarchy. The elegant and liberal life of the Provençal nobility, the fount from which this lyric drew all its vitality, was destroyed. The stream of court poetry was dried up at its source. Even the language was condemned by authority. The culture of the region became entirely French, and the *langue d'oc* declined into a mere group of dialects, with a dialectal literature. The poets took refuge in Catalonia, Aragon, and Italy, where for another century their profession flourished.

The art, abandoned by the aristocracy, was taken up by the citizens of the towns. In 1323 seven burghers of Toulouse founded the "Sobregaya Companhia dels VII. Trobadors de Tholoza," the purpose of which was to further their native poetry. This company developed into a formal society with many sharply defined grades of membership. Their chancellor prepared in 1355 a manual of poetic art, the *Leys d'Amors*, degrees of bachelor and doctor of the 'gay science' were

conferred, and annual competitions in song were held, called the "Floral Games," from the fact that gold and silver flowers constituted the prizes. The pieces composed for these competitions celebrated the Virgin under the names *Amors* and *Clemenza*, the stereotyped love-formulas of the ancient poets being employed in the service of religion. Being written according to rule, these poems are uninspired and of small literary value.

Lyric poetry, though the most important, was not the only manifestation of Provençal literature. Almost all the mediæval forms are to be found. There are epics, mostly fragmentary, the most important of which is *Girart de Rossillon*; Arthurian romances, such as *Jaufré*; short versified tales, called *novas*, which are interesting chiefly as presenting the life of the age; and one long and highly artificial love-story, *Flamenca*, which represents the impossible wooing and conquest of a married lady by a young knight. *Flamenca* has kept for us a most valuable picture of Provençal manners before the year 1235, when it was probably composed. Some historical poems are also of importance, among which may be mentioned the *Chanso d'Antioche*, dealing with the First Crusade, and two long fragments on the Albigensian War. A few fables, hymns, prayers, allegories, epistles, and lives of saints remain; also a great mass of moral, didactic, and scientific verse, of which much is still unpublished. To this class belongs an immense work, a sort of encyclopædia, the *Breviari d'Amors* of Matfre Ermengaud, which consists of over 34,000 lines. Of the drama little has been preserved, and of that little none is earlier than the fourteenth century.

Compared with the poetry, Provençal prose is weak and poor. We have some translations of parts of the Bible and of legends of the saints, some chronicles, some quasi-scientific treatises, and works on grammar (*Donat Provensal*, of about 1243, *Las Razos de Trobar*) and poetics (*Las Leys d'Amors*, of about 1356). The most interesting bit of prose is the *Biographies of the Troubadours*, containing more than one hundred lives, together with *razos*, or stories explaining the circumstances under which particular poems were composed. This work, however, is untrustworthy. Many of the notices are romantic tales, products of the imagination, built wholly upon the poems they are designed to interpret.

Provençal literature, it will be seen, is of slight value apart from its lyric poetry, but this lyric poetry is one of the most important artistic manifestations of the Middle Ages. Poor as it was in ideas and sentiments and empty in its courtly refinement, it was original. Very few outside influences were at work at its rise or in its development. It was the spontaneous outgrowth of chivalric manners and institutions acting under favorable conditions upon a race prone to melody. Its fundamental aridity is offset by variety of form, courtly refinement, and superior musical qualities. Though almost without known ancestry, it was not without known offspring. France, Germany, Spain, and Italy echoed its tones and imitated its conventional forms. In Germany, however, a native spirit soon mastered the Minnesingers, and in Italy a school of thoughtful and cultivated writers developed the love theories of Provence till they were fit for the hand of Dante.

For modern Provençal literature, see FÉLIBRIGE.

BIBLIOGRAPHY. Fr. Diez, *Die Poesie der Troubadours* (2d ed., by Bartsch, Leipzig, 1883); id., *Leben und Werke der Troubadours* (2d ed. by Bartsch, ib., 1882); Fauriel, *Histoire littéraire des troubadours* (3 vols., Paris, 1844; Eng. trans. by Adler, New York, 1860), a work which, though brilliant, loses through hazardous theorizing; Bartsch, *Grundriss zur Geschichte der provenzalischen Litteratur* (Elberfeld, 1872); Ristori, *Letteratura Provenzale* (Milan, 1891), of which there is also a French translation (Montpellier, 1894), perhaps the best brief treatment of the subject; Stimming, "Provenzalische Litteratur," in Gröber, *Grundriss der romanischen Philologie*, vol. ii. (Strassburg, 1892-98); and the *Encyclopædia Britannica* (9th ed.), "Provençal Literature," by Paul Meyer. Gaston Paris, in his *Mediæval French Literature* (London, 1902), treats Provençal literature as a branch of the old French. In addition to these works, collections of poems have been published by Raynouard, *Choix des poésies originales des troubadours* (6 vols., Paris, 1816-21), and in the first volume of his *Lezique roman* (6 vols., ib., 1844); and by Mahn, *Werke der Troubadours* (4 vols., Berlin, 1853-56), and *Gedichte der Troubadours* (Berlin, 1856-73). There are also editions of many individual troubadours and of several of the longer epic and didactic works. Several of the manuscripts have also been printed diplomatically. The best introductory selection of old Provençal poetry and prose is Appel, *Provenzalische Chrestomathie, mit Abriss der Formenlehre und Glossar* (Leipzig, 1895), of which the first part of a second edition appeared in 1902. Consult also the authorities referred to under TROUBADOURS.

PROVENCE (Lat. *Provincia*, province). Formerly a province of Southeastern France, comprising the present departments of Basses-Alpes, Var, and Bouches-du-Rhône, and parts of the departments of Vaucluse and Alpes-Maritimes. The name Gallia Provincia or simply Provincia was given to the country by the Romans, who, about B.C. 120, subdued the territory later constituting Provence, Dauphiné, and Languedoc. *Aquæ Sextiæ* (Aix) was the capital of the new province. During the movement of Germanic peoples in the fourth century the Roman power and the name Provincia were restricted to the southeastern portions of this territory lying between the Rhone, the Durance, and the Mediterranean Sea, and with the fall of Arles about 470 this portion, too, passed into the hands of the Visigothic invaders. After being held from 510 to 536 by the great Theodoric, King of the Ostrogoths, the region passed to the Frankish kings, in whose many partitions it was repeatedly parceled out. It was saved from the Saracens by the famous victory of Charles Martel (732). By the partition of Verdun Provence fell to Lothair; it was seized by Charles the Bald in 863, and in 879 attained the rank of a kingdom under Boso, being known as the Kingdom of Provence or Cisjurane Burgundy. (See **BURGUNDY**.) This was united with Transjurane Burgundy in 933 to form the Kingdom of Arles, which existed for 100 years. Soon after the extinction of the Arletan realm the counts of Provence became hereditary feudal princes. They ruled in practical in-

dependence until 1112, when, upon the failure of male issue, the county passed to Ramon Berenguer (Raymond Berengar), Count of Barcelona, whose male line became extinct in 1245, in the person of Ramon Berenguer IV. His daughter, Beatrice, brought Provence in marriage to Charles of Anjou (q.v.), whose last direct descendant, Joanna I. of Naples, made Louis of Anjou her heir (1382). Best known among the counts of the House of Anjou was René I. (q.v.), the last of the troubadours, whose Court became the home of a splendid culture. René left an only daughter, Margaret of Anjou, and in 1481 Provence fell to France, being formally reunited in 1486. In the life of the French nation the inhabitants of Provence have played their full share, exercising no inconsiderable influence on the development of politics, art, and literature. With the shrewd Norman, the wily Gascon, and the well-fed burgher of Touraine, the hot-blooded, poetic, eloquent Provençal ranks as one of the great national types, which has received concrete form in Alphonse Daudet's undying Tartarin.

BIBLIOGRAPHY. PROVENCE, COUNT OF. The title borne previous to his accession by Louis XVIII. of France.

PROVERB (OF., Fr. *proverbe*, from Lat. *pro-verbium*, adage, from *pro*, before, for + *verbum*, word). A short, sententious phrase or clause long current in common speech. The last phrase, 'long current in common speech,' serves to differentiate the proverb from the multitude of happy expressions in literature which never become permanently fixed in popular usage. "Patience on a monument" is a happy phrase, often quoted by literary men, but it is not a proverb. "A bird in the hand is worth two in the bush" is a proverb. Another frequent characteristic of proverbs is alliteration or rhymes or rhythmic balance. Thus, "Where there's a will there's a way" shows alliteration; "Birds of a feather flock together" shows both rhyme and rhythm; and "Out of sight out of mind" shows rhythmic balance.

Whence comes the proverb? Lord Russell suggests the apparent origin in the phrase 'the wit of one.' Some one gives apt expression to a general truth or to an apparent truth; taken up by others, it spreads far and wide. Saint Jerome is said to have originated "To make a virtue of necessity." In Sterne's *Sentimental Journey* occurs the most beautiful English proverb, "God tempers the wind to the shorn lamb." And it is assigned either to Sterne or to the Bible, where it does not occur. It is found in George Herbert's *Jacula Prudentum* (1640), under the form, "To a close-shorn sheep God gives wind by measure." Herbert clearly took it from the French, "Dieu mesure le froid à la brebis tondue" (sixteenth century). From this point the proverb may be followed back to

Provençal and Latin; and we find, too, the Turkish "God makes a nest for the blind bird." Sterne had come across the saying, clothed it in exquisite language, and made it immortal. As in this specific case, the proverb is made by many hands. Like the ballad and the fairy tale, it is impersonal; and, like them, it goes back to the remotest times. The age of proverb-making is the age of the folk-song. Its frequent metaphor and alliteration suggest this. Later times remold what comes to them. Among nations far advanced in civilization new proverbs are rare. The press throws off phrases of a proverbial character, but they do not often become a part of our speech. They serve their purpose and then disappear. It is the old phrases that we employ, as those relative to sour grapes, the gift horse, the prophet honored elsewhere than at home, haste and waste, honesty and policy. Except in certain cases, as in the examples just given, we do not usually quote proverbs at length, but some phrase or word from them. With these remnants our speech and our very best literature are pervaded. Shakespeare, for example, refers to two proverbs in the same scene of the *Tempest* (II. ii.): "Good liquor will make a cat speak," and "He must have a long spoon who must eat with the devil."

As we have implied, all countries have their proverbs as well as their folk-songs. There is a rich mine in the East—Arabic, Persian, Hindustani, Japanese, and Chinese. "Where the corpse is, there the vultures gather," for example, is an Indian proverb. Of ancient Hebrew proverbs, a whole book is extant. The language of Christ and the Evangelists is ornamented with them. They were turned to the highest spiritual uses in the Sermon on the Mount. Roman proverbs, often relating to husbandry, inculcate frugality, patience, and independence. Trench cites this against high farming: "Nihil minus expedit quam agrum optime colere" (Nothing pays less than over-cultivation). Italian proverbs are of various import, teaching now distrust and cynicism, now subtle wisdom and plain-dealing. Attention has frequently been called to the respect shown to the Devil in the Italian proverb; whereas in the Teutonic proverb—German, Dutch, and Scandinavian—he is a ridiculous figure. The Gallic wit of French literature is curiously absent from the French proverb.

Proverbs appear in Anglo-Saxon poetry, especially in the gnomic verses. In length the gnomic verse proverbs vary from half a line to eight lines. Here are two Anglo-Saxon proverbs: "The wyrd [fates] change not God," and "O lythe [pleasant] it is on land to him whom his love constrains." At the Renaissance this fund of native philosophy was augmented by importation. Chaucer's Dame Partlet turns the Latin "Somnia ne eures" into "Ne do no fors of dremes" (Heed not dreams). In the early part of the seventeenth century appeared two notable collections of proverbs, partly English and partly foreign—George Herbert's *Jacula Prudentum* (1640), and the volume added to James Howell's *Lexicon Tetraglotton*, published separately in 1659, under the title "Proverbs or old Sayed Saws and Adages in English or the Saxon tongue, Italian, French, and Spanish; whereunto the British [Welsh] for their great antiquity and weight are added." Of all countries, Spain possesses the largest and best store

of proverbs. Don Juan de Iriarte (eighteenth century) collected at least 24,000. Cervantes hardly exaggerated the employment of them among the peasants when he made them crowd thick into the mouth of Sancho Panza and come out haphazard. Even after admonished by Don Quixote, Sancho in the next sentence utters four: "In a plentiful house supper is soon dressed;" "He that cuts does not deal;" "With the repique in hand the game is sure;" "He is no fool who can both spend and spare." As in England, the proverb in Spain was a part of popular poetry. The so-called Spanish *copla* (couplet) is a witty proverbial thrust.

There now remains the question of the origin of the similarity between proverbs in various countries. Have those resembling one another a common ancestry? "One swallow does not make a spring," is current in some form among many peoples, and was a proverb some two thousand years ago. Have all the forms of this proverb a common parent? Such a question cannot be safely answered. All that can be done is to attempt to settle the date when a proverb appears in different countries. The tendency, of course, is to say that all forms derive from the oldest. In many cases the investigation leads to the East, and it is perfectly evident that the native proverbs of Europe have been enriched from that source. The media of diffusion were the Bible, the Arabs in Spain, travelers in the East, and mediæval Latin literature. Still more easy is it to understand how proverbs have been exchanged by the peoples of Western Europe, and how Englishmen, Welshmen, and Irishmen have freely given and taken. In spite of all this, it must be remembered that men's minds work in common ways. That one swallow does not make the spring or summer is a natural observation. The thought may have been expressed by a hundred different men far apart in space and time. So, too, it is not probable that "God tempers the wind to the shorn lamb" derives from "God makes a nest for the blind bird." On the other hand, "Where the carrion is, there the eagles gather," seems to be a variant of the Eastern "Where the corpse is, there the vultures gather."

COLLECTIONS. GENERAL; Erasmus, *Adagia* (Paris, 1500; Eng. trans., London, 1814), and Gryneus, *Adagia* (Frankfort, 1643). ENGLISH: The Old-English Gnostic Verses; Heywood, *Proverbs* (London, 1546?), and *Epigrams* (London, 1562?), reprinted for the Spenser Society (London, 1867); Herbert and Howell as cited above; Ray, *Collection of English Proverbs* (Cambridge, 1670); Bohn, *Handbook* (London and New York, 1855), and *Polyglot of Foreign Proverbs*, with translations (London and New York, 1857; new ed. 1889); and W. C. Hazlitt, *English Proverbs* (London, 1859; new ed., 1882); the agreeable essay by Trench, *Lessons in Proverbs* (New York, 1858); Salbach, *Proverbial Treasury* (ib., 1880); Hoyt and Ward, *Cyclopaedia of Practical Quotations* (ib., 1882); R. Inwards, *Weather Lore* (ib., 1898). SCOTCH: Collections by Fergusson (Edinburgh, 1641), Kelly (London, 1721), Ramsey (Edinburgh, 1737), Henderson (ib., 1832), and Hislop (2d ed., Glasgow, 1868). GAELIC: Macintosh (Edinburgh, 1785), Nicolson (ib., 1882). FRENCH: *Proverbes communs* (fifteenth century); Lebon, *Adages et proverbes* (Paris, 1576); Pancoucke, *Dictionnaire des proverbes* (ib., 1749);

Quitard, *Dictionnaire des proverbes* (ib., 1842); Le Roux, *Livre des proverbes* (ib., 1859); Sauv , *Proverbes de la Basse Bretagne* (ib., 1878). SPANISH: The Infante Don Juan Manuel, *Conde Lucanor* (fourteenth century), where proverbs may be found in the tales; Santillana, *Los proverbios* (fifteenth century), 100 proverbs in rhyme; collections in sixteenth and seventeenth centuries were numerous; *Refranes*, from the dictionary of the Academy (Madrid, 1815); Burke, *Spanish Sall* (London, 1877), as represented by the proverbs in "Don Quixote;" and for full information, J. M. Sbarbi, *Monografia sobre los refranes y las obras que tratan de ellos* (Madrid, 1891). ITALIAN: Giusti, *Proverbi toscani* (Florence, 1853), rev. by Capponi (1884). GERMAN: Wander, *Sprichwörter-Lexicon* (Leipzig, 1867), and Rheinsberg-Düringsfeld, *Sprichwörter der germanischen und romanischen Sprachen* (Leipzig, 1872-75). DUTCH: Harrebom s, *Sprekwoorden boek* (Utrecht, 1858-65). DANISH: Collection by Molbech (Copenhagen, 1850), Gruntvig (ib., 1875). ARABIC: Freytag, *Arabum Proverbia* (Bonn, 1838-43); Burckhardt, *Arabic Proverbs* (London, 1830; new ed., 1875). BELLAR: J. Christian, *Behar Proverbs* (London, 1891). There are also collections of proverbs in Russian, Persian, Hindustani, Chinese, Japanese, and in numerous other languages.

PROVERBIAL PHILOSOPHY. Essays in blank verse, on almost every emotion and condition of life, by Martin Farquhar Tupper, in four series, 1838-76. These meditations, often merely common-place, were once very popular, a million copies, it is said, being sold in America, and were translated into several languages, but are now a synonym for dullness.

PROVERBS, BOOK OF. A book of the Old Testament, containing an anthology of gnomes and sentences, forming, in the Hebrew Canon, the second book of the Hagiographa. Like Job and Ecclesiastes, it belongs to the Wisdom Literature of the Hebrews. The form of these proverbs is manifold—similes, enigmas, theses and antitheses, wise sayings, comparisons, etc., vary constantly. The book falls naturally into eight distinct sections, partially marked off by special titles: (1) Chapters i.-ix., forming a kind of introduction to what follows and chiefly taken up with exhortations to the reader to follow wisdom and flee folly. In chapter viii. Wisdom is personified and introduced as the speaker, while in chapter ix. Folly is likewise personified and the two—Wisdom and Folly—are pictured as women, offering rival invitations and inducements to men. (2) Chapters x.-xxii. 16, with the heading 'Proverbs of Solomon,' constitute the kernel of the collection. Each verse is complete in itself and forms an independent saying. (3) Chapters xxii. 17-xxiv. 22, a small separate collection distinguished from what precedes by a series of maxims that usually extend over several verses—generally two or three, though in one case as many as seven. The address, as in the first collection, is to a 'son' and the exhortations are described as 'words of the wise.' (4) Chapter xxiv. 23-34, forming an appendix to the preceding and distinguished by a separate heading. (5) Chapters xxv.-xxix., with the heading 'These also are proverbs of Solomon collected by the men of Hezekiah, King of Judah.' In this collection

again, each verse, as a general thing, forms an independent saying, though this principle is not consistently carried out. Some of the proverbs in this collection duplicate those found in the second. (6) Chapter xxx., with the heading 'Words of Agur ben Jakeh,' a series of enigmatical sayings. (7) Chapter xxxi. 1-9, exhortations addressed to Lemuel, King of Messa, by his mother, the main theme of which is a caution against wine and women. (8) Chapter xxxi. 10-31, an alphabetical poem devoted to the praise of the virtuous housewife.

It is evident from this survey that the Book of Proverbs is a combination of several distinct collections, to which furthermore a number of fragments from other collections have been added. The name of Solomon is introduced as a symbol of practical and theoretical wisdom, just as elsewhere in the Old Testament Solomon is the symbol of wealth, power, and luxury. Some of the sayings may go back to the days of Solomon, and the tradition (xxv. 1) which ascribes a collection of proverbs to the men of Hezekiah's time may be valid, but this has no bearing upon the collection as a whole, nor does it necessarily settle the date of all the sayings embodied in those portions of the book which are distinctly connected by tradition with the name of Solomon.

The Book of Proverbs represents in all probability a gradual growth that extended over a long period of time. Of the separate collections comprised in the book, all the internal evidence points to the second as the oldest, while the fifth comes next. The first is later. The third and fourth divisions may be regarded as fragments which were added to x.-xxii. 16, and similarly the sixth and seventh divisions are fragments added to xxv.-xxix. The alphabetical poem (xxx.) is an independent composition of a late date. It is doubtful whether the oldest collection belongs to the pre-exile period, and the sections were not put together until after the return from Babylonia. The internal evidence, however, is insufficient for fixing the dates of compilation of the various divisions of the book more definitely. As the latest date for the first section, and therefore the earliest possible date for the compilation in its present shape, we may fix upon B.C. 250. Many of the sayings are no doubt of popular origin, but the great bulk bear a scholastic and pedantic character which points to their rise in literary circles.

BIBLIOGRAPHY. There are commentaries on the Book of Proverbs by Ewald (2d ed., Göttingen, 1867; Eng. trans., London, 1880); Delitzsch (Leipzig, 1873); Nowak (ib., 1883); Strack (Munich, 1888; 2d ed. 1889); Vildeboer (Freiburg, 1897); Frankenberg (Göttingen, 1898); Perowne, *Cambridge Bible for Schools and Colleges* (Cambridge, 1899); and Toy, *International Critical Commentary* (New York, 1899). Consult, also: Cheyne, *Job and Solomon* (London, 1887); Baumgarten, *Etude critique sur l'état du texte du livre des Proverbes* (Leipzig, 1890); Baudissin, *Die alttestamentliche Spruchdichtung* (ib., 1893); Davidson, *The Wisdom Literature of the Old Testament* (London, 1894).

PROVIDENCE (Lat. *providentia*, foresight, from *providere*, to foresee, from *pro*, before, for + *videre*, to see). A term of theology, including two elements, God's preservation and administration of the material universe, and His moral

government over His rational creatures. It may be considered in three aspects. In its *philosophical* aspect, Providence is a direct corollary of the causality of God. If God is the true first cause, that is, if He called all existing things into existence by the exertion of His power, then ultimately they all depend upon Him, and it is impossible to see how they can finally go a way to which He does not consent. If creation includes the gift of free will (q.v.), then there may be opposition to God's will on the part of the creature, or sin. But even the range of this and its outcome will be under God's government, so that it cannot go further than He will have it, and in the realm of nature everything must reflect His will perfectly. In its *religious* aspect the doctrine of Providence meets a universal demand of the moral nature of man. Man demands religion, that is, communion with God. He needs prayer, and the answer of prayer. He needs to know that he can confide himself to the wise and fatherly care of God and will thus be put in safety and under perfect guidance. Particularly in the stress of life, under its burdens and afflictions, he needs to feel that God is supreme, that what is sent to him is for his good and ultimately good itself—else he cannot resign himself to his lot or live in peace of heart and in confidence as to the eternal future. The great proof of Providence from these considerations arises from the conviction that the deepest nature of man reflects God's will, and that demands which He has himself created in man He will satisfy. Providence viewed religiously is of two kinds, general, by which God governs the world at large according to certain wise plans, and special, by which He cares for each individual according to his personal necessities.

In its *biblical* aspect, the doctrine of divine providence is a revealed truth. The Bible is full of expressions of the control of God over nature and man. These expressions are very comprehensive, and often assert, according to Jewish modes of speech, His direct participation in everything, even in the sin of man. He is said to 'create evil,' and to 'harden Pharaoh's heart.' His foreknowledge extends to men's volitions, even their most trifling ones, and to the secrets of their hearts. But the main current of biblical thought provides the due corrective against the hasty erection of such expressions into dogmatic propositions. Man's free will is abundantly recognized, and his responsibility for his sin emphasized. The true meaning of these biblical expressions is that nothing takes place outside of the divine control. That very process which is said to have hardened Pharaoh's heart was designed and calculated to soften it, since it was a long exhibition both of the power and the mercy and forbearance of God. And in the end Pharaoh's wickedness was controlled by God's hand and prevented from going to the point of defeating the divine purposes. The caution may need repeating that we are not to take the popular forms of biblical speech as declaring with metaphysical exactness that no future event can escape the foreknowledge (q.v.) of God and no volition lie outside the scope of His eternal decree. The Bible gives the general law. This is divine government over all things. Ultimately, in the sense of bounding and limiting, every event is governed, in the strictest sense. See PREDESTINATION.

PROVIDENCE. The second largest city in New England, the capital of Rhode Island, and the county-seat of Providence County; 44 miles southwest of Boston and 188 miles northeast of New York (Map: Rhode Island, C 2). It is situated about 35 miles from the Atlantic Ocean, at the head of the Providence River, an arm of Narragansett Bay. Several steamship lines connect with Atlantic coast ports, and the railroad facilities comprise the New York, New Haven and Hartford and leased roads.

The city lies on both sides of the Providence River, its easterly limits being marked by the Seekonk River. Its area is nearly 18 square miles. The surface of Providence is uneven, the west side consisting practically of a sandy plain, while on the east side, the more interesting part of the city, there are several hills, the greatest height of which is some 200 feet. This elevated section offers beautiful sites for residences. The business district is in the centre of the city, and some of the finest business houses are built on made land. There are 228 miles of paved streets, two-thirds of this distance being laid with macadam. In the older part of the city the thoroughfares are narrow and crooked. Providence has 540 acres in public parks, among which is the noteworthy Roger Williams Park. This has been improved at a considerable expense and is a beautiful pleasure-ground. It has a fine system of boulevards, artificial lakes, zoological gardens, and a statue of Roger Williams. The Soldiers' and Sailors' Monument stands in front of the city hall, and near-by is a statue of Gen. Ambrose E. Burnside. What Cheer Rock, on the Seekonk River, is of historic interest as the landing place of Roger Williams.

The new State House, first occupied in 1900, and the city hall are among the finest buildings in Providence. The former is a massive edifice of marble and granite, and has a large dome. Other prominent structures are the public library, the Federal Government building, the county court-house, the Roman Catholic Cathedral of Saint Peter and Saint Paul, the high school buildings, and the Union Railway Station. Among business structures the Arcade is noteworthy, and there are a number of commodious office buildings of recent construction. Brown University (q.v.), with its large buildings on the east side, is one of the principal features of the city. Providence has several noted charitable institutions, among which are the Rhode Island Hospital, Rhode Island Homeopathic Hospital, Butler Hospital for the Insane, Saint Joseph's Hospital, the Dexter Asylum for the Poor, and the State Institute for the Deaf. Besides Brown University, the educational institutions include the Friends' School, which dates from 1818, the State Normal School, the Rhode Island School of Design, and the Rhode Island Law School. The public library contains about 90,000 volumes. Other important libraries are the State Law Library, and those maintained by the Providence Athenæum (62,000 volumes), the Rhode Island Historical Society, and the Rhode Island Medical Society. The Historical Society possesses also a collection of relics, and the Athenæum some valuable pictures.

Providence is a port of entry, but is noted primarily for its manufacturing interests. Its foreign trade in 1901 was valued at \$1,154,000,

of which the exports constituted a very small part. Formerly it carried on considerable foreign commerce, but the trade now is mostly coastwise. Large quantities of coal are handled at its docks, and the city controls extensive wholesale and jobbing interests. The relative unimportance of Providence in foreign commerce is due to the lack of sufficient depth in the harbor for ocean steamships, and to inferior docking facilities. Otherwise the natural waterway through the Providence River and Narragansett Bay forms one of the best harbors on the New England coast. Providence is the first manufacturing city in Rhode Island, its products comprising nearly half of the total output of the State. The various establishments in the census year of 1900 represented an invested capital of \$83,514,000, and had a production valued at \$88,169,000. In the manufacture of jewelry Providence is among the leading cities of the United States; it is noted also for its extensive production of silverware, worsted and woolen goods, cotton goods, engines and boilers, machinery, including cotton milling machinery, fine tools, and files. Dyeing and finishing textiles, refining gold and silver, slaughtering and meat-packing, and the manufacture of rubber and elastic goods, oleomargarine, malt liquors, etc., are other important industries.

The municipal government is vested in a mayor, elected annually, a bicameral council, consisting of a board of aldermen and a common council, and in administrative officers, the majority of whom are elected by the council. The council elects three commissioners of sinking funds, the park commissioners, and the license and fire commissioners. The commissioner of public works is appointed by the mayor. The city treasurer, harbor master, overseer of the poor, and school committee are chosen by popular vote. Providence spends annually in maintenance and operation about \$3,465,000, the principal items being: For schools, \$740,000; for interest on debt, \$640,000; for the police department, \$370,000; for the fire department, \$355,000; for street expenditures, \$290,000; for municipal lighting, \$290,000; for the water-works, \$135,000. The total income for the fiscal year 1902 was \$4,320,000. The water-works, which were constructed at a cost of \$7,100,000, are owned and operated by the municipality. The system now comprises 330 miles of mains. There are 193 miles of sewers. Public bath-houses are maintained as a municipal activity. The bonded debt of the city in 1902 was \$16,825,000, and the net debt \$14,030,000; the assessed valuation of real and personal property was about \$193,000,000.

The population of Providence in 1800 was 7614; in 1850, 41,513; in 1870, 68,904; in 1880, 104,857; in 1890, 132,146; in 1900, 175,597. The total in 1900 included 55,855 persons of foreign birth and 4817 of negro descent.

Providence was founded and named in 1636 by Roger Williams, who, having been expelled from Massachusetts, came here and bought a tract of land from the Narragansett sachems, Canonicut and Miantonomoh. Here a distinct separation was made between spiritual and temporal affairs, complete religious toleration being unequivocally guaranteed. The first Baptist church in America was organized in 1638 under the ministry of Roger Williams. Williams secured in 1644 a Parliamentary charter, under which Providence, Portsmouth, and Newport were

united for governmental purposes as the "Providence Plantations in the Narragansett Bay in New England." In 1676, during King Philip's War, Providence was attacked by Indians and 29 of its 75 houses burned. Near Providence occurred in 1772 one of the first overt acts of the Revolution, the burning of the British cruiser *Gaspee*. In September, 1815, a tremendous gale forced the water back into the harbor and river, flooded part of the town, and destroyed property valued at over \$1,000,000. Providence was incorporated as a city in 1832. Consult: Greene, *The Providence Plantations for Two Hundred and Fifty Years* (Providence, 1886); Bayles, *History of Providence County* (New York, 1891); and a sketch in Powell, *Historic Towns of New England* (New York, 1898). *The Early Records of the Town of Providence* have been printed in 15 volumes (Providence, 1892-99).

PROVINCE (Lat. *provincia*, from *pro*, before, for + *vincere*, to conquer). A term used in geology to designate an area in which the deposition and succession of sediments are uniform. In paleontology it refers to a more or less well-marked district throughout which the animal or plant life was the same.

PROVINCE HOUSE. A brick mansion on Washington Street, Boston, built in 1679. It became the residence of the Governors of the Province in 1715, and after many changes was burned in 1864. It is described in Hawthorne's *Twice-Told Tales*.

PROVINCETOWN. A town in Barnstable County, Mass., 54 miles by water and 120 miles by rail southeast of Boston; on Cape Cod Bay, and on a branch of the New York, New Haven and Hartford Railroad (Map: Massachusetts, G 3). It is situated at the extremity of Cape Cod, and has a deep, spacious harbor. There is a public library with 8500 volumes. Provincetown has some reputation as a summer resort, but is best known for its fishing and whaling industries, the latter of which, however, in recent years has declined considerably. In the town are several wholesale fish establishments, also manufactories of various kinds of oil. Population, in 1890, 4642; in 1900, 4247. On November 21, 1620, the Pilgrims in the *Mayflower* arrived in Provincetown Harbor and remained anchored there for nearly a month. It was here that the celebrated compact was signed and the first Governor, John Carver, was chosen. Permanently settled about 1680. Provincetown formed a precinct of Truro from 1714 until 1727, when it was incorporated. Its growth was very slow and in 1776 it had a population of only 205. Here during the Civil War the Confederate commissioners, Mason and Slidell, were delivered to the British gunboat *Rinaldo*. Consult Freeman, *The History of Cape Cod* (Boston, 1860-69).

PROVING GROUND. An establishment maintained for the sighting and testing of ordnance and the testing of armor and projectiles. In the United States the army proving ground is on Sandy Hook, N. J., and the naval proving ground at Indian Head, on the Potomac River.

PROVINS. *provân's*. The capital of an arrondissement in the Department of Seine-et-Marne, France, on the Voulzie, 59 miles by rail southeast of Paris (Map: France, K 3). Built at the base

and on the slope of a steep hill, with considerable remains of the thirteenth-century ramparts, it has a picturesque mediæval aspect. The chief buildings are the eleventh-century Romanesque Gothic Church of Saint Ayoul; the twelfth-century Transitional Church of Saint Quiriace with its adjacent bell-tower; the twelfth-century Grosse Tour or keep of an ancient fortress; the Church of Sainte Croix, town hall, and hospital dating from the thirteenth century; the sixteenth-century Tour de Notre Dame du Val, and several ancient dwelling houses. The town maintains a museum and public library, and has a public garden and pleasant boulevards. The culture of 'Provins' roses is a local industry of repute; there are manufactures of confectionery, and a trade in the mineral waters of its chalybeate springs. Provins was the Roman *Prucinum*, and under the rule of the counts of Champagne in the Middle Ages was an industrial centre, it is recorded, of over 80,000 inhabitants. Its decay dates from the Hundred Years' War with England and the Religious wars. Population, in 1901, 8794.

PROVISIONAL ORDER (from *provision*, Lat. *provisio*, foresight, from *providere*, to foresee). In England, an order granted under the powers conferred by an act of Parliament, by a department of the Government, by the Secretary of State, or by some other authority, whereby certain things are authorized to be done, which could be accomplished otherwise only by an act of Parliament. The order does not receive effect, however, until it has been confirmed by Parliament. Till that time, it is purely provisional; and even after it has been so confirmed, and is in reality an independent act, it retains the title of a provisional order. Provisional orders have no counterpart in the legislative system of the United States, owing to the political division into States, and to the fact that Congress is thereby relieved of purely local legislation, which in England must be done by Parliament. See PARLIAMENT.

PROVISIONAL REMEDY. Under modern codes of reformed procedure, an extraordinary proceeding to prevent a dishonest defendant from disposing of his property before judgment can be obtained in an action commenced at the same time as the proceeding. Under the New York Code and codes following it, the provisional remedies are: Order of arrest; warrant of attachment; temporary injunction; and receiver. See PROCEDURE; ACTION.

PROVISO (Lat., it being provided, abl. sg. of *provisus*, p.p. of *providere*, to foresee). In law, a clause in a legislative act, or in any legal instrument, which contains a qualification, limitation, or condition affecting or governing the preceding clauses. A common example of a proviso is the defeasance clause in a mortgage, the latter being in form an absolute conveyance, but with a proviso that if the mortgagor, or person who executes it, performs a certain obligation, then the instrument shall become null and void. See CONDITION; DEED; MORTGAGE.

PROVISORS, STATUTE OF. The name of several statutes of England, which were intended to prevent the Pope from presenting to benefices in England, or, as it was technically known, from using the rights of provision and reservation. Since the time of Innocent III. (1198-1216) the

Pope had frequently appointed foreigners to bishoprics and the like. Often these never lived in England, and merely sought to derive as much revenue as possible, leaving the ecclesiastical duties to others. Edward I. in the Statute of Carlisle (1307) sought to prevent the heads of the great monastic Orders from burdening the English monasteries with taxes, and by implication included the Pope in this prohibition. It was not, however, until 1351 that the first Statute of Provisors of Benefices was passed, which seriously aimed to check the various abuses. Heavy penalties were to be imposed for the violation of the law. Nevertheless the statute was not enforced, and it was reënacted in 1362 and again in 1390, the last time with additional safeguards. For diplomatic reasons, however, the kings of England were compelled frequently to give way to the Papal demands, and consequently the statute was in practice always suspended. Moreover, the King himself found it often convenient to override the rights of the cathedral chapters and obtain the appointment of a favorite to some benefice or other by employing the aid of the Papal machinery. It was not until the breach with Rome took place in the reign of Henry VIII. that the abuses which the Statute of Provisors sought to check ceased. The text of the statutes will be found in Adams and Stephens, *Select Documents of English Constitutional History* (New York, 1901). Consult also: Stubbs, *Constitutional History of England* vols. ii. and iii. (Oxford 1895-96); Lingard, *History of England*, vol. iii. (London, 1883).

PROVO CITY. The county-seat of Utah County, Utah, 48 miles south of Salt Lake City; on the Provo River, and on the Rio Grande Western and the Oregon Short Line railroads (Map: Utah, B 1). It has the Brigham Young Academy, one of the largest educational institutions of the Latter Day Saints, a Mormon tabernacle, and the State Insane Asylum. Utah Lake, three miles distant, the Bridal Veil Falls, and the Provo Cañon are much visited for their scenic attractions. Provo City is situated in an agricultural, fruit-growing, and cattle-raising region. It manufactures woolen goods, flour, tin and iron roofing, etc., and there is considerable trade in lumber. Settled in 1849, Provo was chartered as a city in 1851. Population, in 1890, 5159; in 1900, 6185.

PROVOKED HUSBAND, THE. A comedy begun by Vanbrugh as *A Journey to London*, and left unfinished at his death. It was completed by Colley Cibber and published in 1728.

PROVOKED WIFE, THE. A comedy by Vanbrugh, produced in 1697. The hero, Sir John Brute, a rough, mischievous fellow, annoyed his fine-lady wife by swearing, and going home drunk every night after wild escapades. It was Garrick's favorite part.

PROVOOST, pró-vô', SAMUEL (1742-1815). First bishop of the Protestant Episcopal Church in New York. He was born in New York City, of Huguenot descent, and was educated at King's (now Columbia) College. In England he continued his studies at St. Peter's College, Cambridge, and was ordained priest in 1766. He returned to New York and became an assistant minister of Trinity parish, a post he retained until 1774, when he withdrew, it is alleged, on

account of holding views regarding the approaching struggle with the mother country at variance with those entertained by the majority of the parishioners. He declined to serve as delegate to the Continental Congress, though his patriotic impulses led him to join his neighbors in their pursuit of the British after the burning of the town of Esopus. He did not resume the active ministry until the close of the war, when, in 1784, he became rector of Trinity Church, New York, and shortly thereafter a member of the Board of Regents of the University. The following year he became chaplain of the Continental Congress, then meeting in New York. In 1786 he was elected first Bishop of New York at the Diocesan Convention, and in company with William White, Bishop-elect of Pennsylvania, sailed for England, where they were consecrated at Lambeth by the archbishops of Canterbury and York and the bishops of Bath and Wells and Peterborough. As a preacher Bishop Provoost was learned and polished, but without warmth and fervor. In 1800 he resigned the rectorship of Trinity and the following year sought to relinquish his episcopal office, but the House of Bishops, declining to accept his resignation, appointed instead an assistant bishop. Consult: *The Centennial History of the Protestant Episcopal Church in the Diocese of New York, 1785-1885*, edited by James Grant Wilson (New York, 1886); and *The History of the American Episcopal Church, 1587-1883*, by William Stevens Perry (Boston, 1885).

PROVOST (OF. *provost*, *prevost*, Fr. *prévôt*, from Lat. *praepositus*, principal, provost, p.p. of *praepone*, to set before, from *prae*, before + *ponere*, to place). The title of various academic, ecclesiastical, and civil officials. In England the heads of certain colleges, as of Oriel, Queen's, and Worcester at Oxford, of King's College, Cambridge, and of Eton College, are called provosts. In the United States this title is given to the heads of some institutions, as, for example, the University of Pennsylvania. It is applied as an ecclesiastical title to the head of a cathedral or collegiate chapter, especially in Germany. The title is also given to the superiors of certain religious houses of lesser rank which bear a relation to the mother house analogous to that which a priory bears to an abbey. In the Protestant churches of Germany the title of provost is sometimes used as synonymous with that of dean or arch-priest; and occasionally, where several minor churches or chapels are attached to one chief church, the minister in charge of the latter is called provost. The civil use of the title is found chiefly in Scotland, where the chief municipal magistrate of a burgh or city is styled provost. The provost presides in the civil courts together with the bailies, who are his assistants. The chief magistrates of the cities of Edinburgh and Glasgow are styled Lord Provost, and the claims of the provosts of Aberdeen and Perth to the designation of lord, although at one time contested, are now held to be fully established.

PROVOST-MARSHAL. A military official in charge of the military police of a camp, garrison, or in the field. In the United States Army he is required to accept all prisoners handed over to him by an officer belonging to the army or navy, and has also within his province the duty of arresting soldiers guilty of offenses of a gen-

eral nature. In the British Army the provost-marshal has a captain's rank, and authority to punish any offender taken *flagrante delicto* on the spot, according to the provisions and penalties laid down in the Mutiny Act.

In the navy the provost-marshal is an officer attached to a naval court-martial who is responsible for the safe keeping of prisoners under trial before the court; also for the serving of notices to witnesses and executing the processes of the court. He is usually an officer of the navy (not above the rank of lieutenant) or of the marine corps (not above the rank of captain), but in case of the trial of enlisted men a petty or non-commissioned officer may act as provost-marshal.

PROXY (contraction of *procuracy*, from ML. *procuracia*, *procuratia*, charge, care, from *procurare*, to take care of, from *pro*, before, for + *curare*, to care, from *cura*, care). The agency of one person who acts as substitute for another, usually in public assemblies, conventions, and other bodies. It is now rarely permitted in legislative bodies, though formerly it was the privilege of English peers. A result of this privilege was the somewhat notorious non-attendance of the Lords upon the sessions of Parliament. In the United States voting by proxy is quite common in political conventions.

PRUDEN, prūd'den, THEOPHIL MITCHELL (1849—). An American physician, teacher, and author, born at Middlebury, Conn. He was educated at the Yale Medical School, the New York College of Physicians and Surgeons, and at the universities of Heidelberg, Berlin, and Vienna. In 1879 he was appointed assistant in histology and pathology in the College of Physicians and Surgeons, of Columbia University, and in 1892 was given the chair of pathology there. His technical publications include a *Manual of Normal Histology* (1881), a *Handbook of Pathological Anatomy and Histology* (with F. Delafield, 1885), *Story of the Bacteria* (1889), *Dust and Its Dangers* (1891), and *Drinking Water and Ice Supplies* (1891).

PRUDENTIUS, prōō-dēn'shī-ūs (AURELIUS CLEMENS PRUDENTIUS) (348-405?). The greatest poet of the early Latin Church and one of the leading literary figures of the fourth century. He was born in Spain (probably in Saragossa). He received a liberal education, was admitted to the bar, practiced as a pleader, discharged the functions of a Roman magistrate, and received appointment to a high position at Court. His early life was gay and dissipated, but after his conversion he devoted himself to the service of the Church. He lived in an age of great Christian leaders, among them Ambrose, Jerome, and Augustine, and from Ambrose he derived his impulse toward poetic composition. Among his poems the *Cathemerinon*, or 'Daily Round,' includes twelve hymns, of considerable length, designed for devotional use. The *Psychomachia*, or 'Soul's Conflict,' pictures the battle which virtue and vice wage over the soul of a Christian. This is the earliest type of pure religious allegory in the Western Church, and may almost be said to mark an epoch in literary history. In the *Peristephanon*, or 'The Crowns,' we have a collection of fourteen hymns in praise of martyrs and martyrdom, about half of them dealing with Spanish subjects. The two books *Against Symmachus* carry on the battle,

already begun by Ambrose, against the proposed restoration of the altar of Victory to the senate house. Two of Prudentius's poems are distinctly theological, the *Hamartigenia*, on the origin of evil, and the *Apotheosis*, a defense of the doctrine of Christ's divinity. In both these works the influence of Tertullian is unmistakable. Consult: Glover, *Life and Letters in the Fourth Century* (Cambridge, 1901); Ebert, *Geschichte der Literatur des Mittelalters* (2d ed., Leipzig, 1889); Boissier, *La fin du paganisme* (3d ed., Paris, 1898); Thackeray, *Translations from Prudentius* (London, 1890).

PRUD'HOMMES, pru'dôm' (Fr., discreet men), **COUNCIL OF**. Municipal tribunals, which existed first in the Middle Ages at Marseilles, Lyons, and elsewhere in France, exercising an equitable jurisdiction as arbiters of trade disputes. Similar tribunals, under the same name, were re-introduced by Napoleon I. in 1806, and were found to be of great practical utility. They were instituted at first in favor of the silk trade and other trades immediately connected with it. Under the present French Republic the system has been continued, the *Conseils des Prud'hommes* being citizens elected by the people irrespective of their connection with capital or labor. In their original form they somewhat resembled the boards of arbitration established in several of the United States, whose purpose it is to cause a speedy and just settlement of labor disputes.

PRUD'HON, pru'dôn', PIERRE (1758-1823). A French historical and genre painter, born in Cluny. His father was a stone-cutter, and he received his first instruction from the monks of the Abbey of Cluny. Afterwards he studied under Desvoges at Dijon. An unfortunate marriage handicapped the painter in his youth. He worked in Paris with Wille, the engraver, and in 1783 won the *Prix de Rome*. In 1789 he returned to Paris, and at first supported himself by working for the booksellers, but finally attracted the attention of Napoleon, who gave him lodging in the Sorbonne. Under the influence of his friend Constance Mayer, a pupil of Greuze, he painted his best pictures, such as the portrait of Josephine (Louvre) and "Crime Pursued by Vengeance and Justice" (1808, Louvre), for which he received the Legion of Honor. In 1811 he was appointed drawing master to the Empress Maria Louisa, and in 1816 he was elected to the Institute. After the death, by suicide, of Mlle. Mayer, in 1821, Prud'hon completed his picture "The Unfortunate Family" (Louvre), and painted a few religious pieces, including "Crucifixion" (Louvre). Though he nearly always painted classical subjects, he was one of the principal precursors of Romanticism. In Italy he had studied Leonardo, and his women have something of the subtlety of this master. The delicacy of his coloring, the correctness of his drawing, and the simplicity of his conception, make him one of the most pleasing of the successors of David. Consult: Clément, *Prud'hon, sa vie, ses œuvres et sa correspondance* (Paris, 1868 and 1872); De Goncourt, *L'art au XVIIIème siècle* (Paris, 1875).

PRUNE (Lat. *prunum*, plum, *prunus*, plum-tree, from Gk. *πρῦνον*, *prounon*, *πρῦνον*, *prounon*, plum, *πρῦνος*, *prounos*, *πρῦμη*, *proumnê*, plum tree). Any variety of plum which can be successfully cured without removing the pit. Only those varieties which have a large propor-

tion of solids, and sugar in particular, are considered good prunes. The prune industry was started in the Eastern United States in 1854, but failed because the climatic conditions were not favorable for the production of the desired qualities. About 1863 the industry started in California and grew rapidly. In 1880 the output had reached 200,000 pounds annually, and in 1900, 100,000,000 pounds, thus developing in 30 years an industry with an annual output greater than France, hitherto the chief prune-producing nation of the world. Oregon, Washington, and Idaho also grow good prunes, as do also Serbia, Germany, Spain, Australia, and South Africa.

The prune may be cured in three ways. (1) Sun-drying, the common and most economical way where climatic conditions will admit it. This is largely practiced in California, as well as in the European countries. The prunes are not picked until ready to fall, when they are gathered, graded, and dipped in hot lye or run through a pricking machine, after which they are spread on boards or wire-bottomed frames and put out to dry, an operation which takes from 8 to 12 days, depending upon the variety, the size of the plum, and the weather. (2) They are treated by evaporation, the drying being effected by fire heat. In this operation great care and skill are necessary, as too hot a fire will cause the fruits to burst, drip, and finally shrivel. If properly handled the evaporated product is superior to the sun-dried fruits. (3) The fruits in some European countries are partially cooked before being dried. Such prunes are softer than the sun-dried or evaporated ones. After being dried the fruit goes through a curing process, by being thrown into bins or heaps to sweat, which takes from one to three weeks. After this they are ready for 'processing,' which consists in dipping fruits in boiling water and glycerin, steaming, or by 'rattling' in a revolving cylinder. The object of this operation is to improve the color and appearance of the fruit and to destroy the eggs of any insect which may be upon them. They are then ready for packing, the best products being placed in boxes, although many are packed in bags.

PRUNE INSECTS. The insects which damage the prune are mainly those found on plums and peaches (q.v.).

PRUNING (from *prune*, from OF. *proignier*, *progner*, *provignier*, Fr. *provigner*, to prune, from OF., Fr. *provin*, vine, from Lat. *propago*, sucker, from *propagare*, to propagate, from *pro*, before, for + *pangere*, Gk. *πρηνύσαι*, *pēgnynai*, to fasten). The removing of any part of a plant, either root, stem, or branch, to discourage growth in one direction and turn the energies of the plant in another. It is considered an artificial operation, but nature is a constant and very severe pruner, as is shown by the long, slender, limbless boles of many forest trees. When plants are taken from their natural environment and the forces which regulate their habits, pruning becomes a necessity. In this work the gardener must be guided by the well-known laws of plant growth governing the healing of wounds and the balance of parts. At planting time the tops of trees must be pruned in order to establish a proper relation of top to root, which is always unavoidably reduced in the process of digging. This pruning is necessary also because the roots

have no intimate connection with the soil by which the demands of the expanding leaves can be supplied with food and moisture; in fact, the demands of the top should be less than the root can meet in order that a too severe strain shall not be placed upon the organism. Pruning may be performed for the purpose of correcting the habit of growth. The head may be made high or low, compact or open, at will, almost regardless of the natural habits of the tree. In general, however, the peculiar nature of the tree should be taken into account and the pruning made to conform as closely as possible to that form. Where fruit is the object sought the manner of fruit production of the plant must be thoroughly understood, otherwise pruning may induce wood growth at the expense of fruit production. For instance, apples and pears bear fruits upon spurs; peaches, usually on the young branches (sometimes on spurs) of the previous season's wood; grapes, on wood of the current year produced from buds developed the year previous. In order, therefore, intelligently to prune any plant for fruit production, its fruiting habit must be carefully considered. Sometimes desired results are obtained by root pruning, or by cutting away a portion of the bearing wood. In the first case fruit-bearing is induced, in the second the fruits are thinned or their number decreased, the food supply distributed to a lessened number which may be correspondingly increased in size. Pruning also admits light to the tree tops by removing superfluous branches, thus making the fruits higher colored.

Besides these objects pruning is used to change the form of head ('heading'). Whatever be the object, the operation should be performed in the manner least injurious to the plant. This involves the method of removing the branch and the time of year the work should be done. In regard to the season for pruning little exact information can be given. As a rule apples, pears, and cherries suffer least if pruned while, in full vigor of growth. The wounds heal readily and there is less liability to loss of vitality than at other seasons. The peach should be pruned early and severely for wood growth, and late and lightly for fruit production; the same is also true of the grape. All pruning of the grape and peach should be confined to the resting period.

The manner of pruning so as not to lessen the vigor or shorten the life of the plant involves systematic annual pruning, by which the removal of large branches can be avoided. All cuts should be made close to and parallel with the main branch so as to promote the healing process. Large wounds must be covered with some preservative or protective coating to prevent decay. The healing of a wound is accomplished by the formation of a callous from the growing tissues. The process continues, and by the annual deposition of new material the wound is covered. A smooth cut will heal where a jagged cut or bruise will decay. Trees grown upon walls or espaliers require great skill in pruning in order to hold them within bounds, and at the same time secure the maximum production of fruit or flowers. In grape-growing certain styles of pruning have been given special names—e.g. renewal; high renewal; Kniffen, etc.

Ornamental trees are either pruned for the purpose of correcting the habit of growth, as the shortening of a leader in order to thicken the

growth and make the tree broader, or for the purpose of giving the plant a particular form, as is the case with hedge plants and with evergreens used in formal gardens.

Consult Bailey, *The Pruning Book* (New York, 1898), also numerous experiment station bulletins.

PRURIGO (Lat., itch). The name of a skin disease restricted to *prurigo of Hebra*, not including all conditions in which there is pruritis. Formerly dermatologists distinguished *prurigo mitis*, *prurigo formicans*, and *prurigo senilis*, which are now relegated to the eczematia and the lichens (q.v.). True prurigo, also called *prurigo agria* or *ferox*, begins in infancy or in childhood or youth, persisting with recurrences for many years. It resembles *urticaria* (q.v.). The eruption is generally at first a series of white or rosy plaques with itching, agitation, and in-omnia. Then papules appear, as pale red points, excoriated at the summit, usually on the anterior and external portions of the legs and thighs, about the pelvis and buttocks, and also upon the upper extremities. The skin hardens, and becomes thicker, furrowed with folds and covered with crusts. Vesicles may appear, exuding yellowish serum, or sanguineous, and blackened. Impetigo, furuncle, abscess, and lymphangitis, all resulting from inoculation, may complicate the attack. Indolent lymphatic glandular enlargements may appear in the groin. The prognosis is very unfavorable. The disease generally disappears between the eighth and eighteenth year, in the milder cases. Many are incurable. Asthma, emphysema, and chronic bronchitis are very common among the victims of prurigo. Diet, cod-liver oil, pilocarpine, carbolic acid, cannabis indica, and analgesics are of avail. Bran baths, starch baths, cod-liver oil, styrax, sulphur, ichthyol, and resorcin are among the local applications used. Hermetically sealing up the skin is the most effectual treatment of all. Consult Kaposi, *Pathology and Treatment of Diseases of the Skin* (Eng. trans., New York, 1895).

PRUSSIA, prūsh'ā. A kingdom and the largest State of the German Empire. By the Imperial Constitution of 1871 the King of Prussia bears the title of German Emperor. The Prussian territory completely or nearly surrounds that of five of the smaller States of the Empire—the grand duchies of Mecklenburg-Schwerin and Mecklenburg-Strelitz, the duchies of Anhalt and Brunswick, and the Grand Duchy of Oldenburg; also the three free towns of Lübeck, Hamburg, and Bremen. With these exceptions the whole of North Germany and its low plain are embraced in the Kingdom of Prussia. A small detached portion of Prussia, Hohenzollern, is in the extreme south of the Empire. Exclusive of Hohenzollern, Prussia extends from latitude 49° 7' to 55° 54' N., and from longitude 5° 52' to 22° 54' E. It is bounded on the north by the North and Baltic seas and Denmark, on the east by Russia (mainly Poland), on the south by Austria-Hungary, Saxony, the Thuringian States, and the South German States, and on the west by the North Sea, the Netherlands, Belgium, and Luxemburg. With an area of 134,548 square miles, it embraces more than three-fifths of the territory of the German Empire. It also has three-fifths of the population of Ger-

many. The density of population is over 250 to the square mile.

TOPOGRAPHY. Prussia has a frontage of nearly 1100 miles on the North and Baltic seas. The tidal variations of level in the North Sea are not great, but northwest storms have wrought great destruction on the low, flat seaboard of Prussia, so that in the course of centuries a large area of coast has been destroyed by the washing away of the shores. The Frisian Islands, fronting this part of the Prussian coast, are the ruins of a former coast line, and large parts of the present coast are saved from destruction only by costly works of protection. Much of the coast is bordered by marshy land, which affords fine pasturage. The Baltic, still more shallow than the North Sea, also lacks important flood and ebb tides, and no marsh formations are found along this coast. There are fewer islands than along the North Sea, one, however, the island of Rügen, being of considerable size. The coast has several deep indentations, the most important of which are Kiel Bay, Lübeck Bay, Pomeranian Bay, and the Gulf of Danzig. Sand dunes stretching along parts of the coasts have nearly cut off the sea, and the lagoons (Haffs) within are filled with fresh water from the rivers emptying into them, so that the Haffs are only slightly brackish. Outside of Hamburg, Bremen, and Lübeck, Prussia has all the important seaports of Germany.

The great plain which comprises by far the larger part of Prussia is by no means flat or level, though its elevations formed of the accumulations of boulders and ground moraine of the Ice Age rarely exceed 600 feet in height. Communications in all directions meet with no obstacles on this comparatively level surface, stretching in Prussia between the Ems and Russia and southward nearly to the southern boundary of the kingdom. (See GERMANY.) In the south-centre (region of the Harz) and the southwest (lower Rhine Plateau) the surface rises and merges with the hilly and mountainous regions of the South German States; but in the southeast the great northern plain is continued in the low plain of the Oder and only the fringe of the kingdom covers the northern part of the Sudetic ranges.

HYDROGRAPHY. Prussia has the middle and lower courses of all the great rivers of Germany excepting the Danube. It is within its borders, therefore, that the Rhine, Weser, Elbe, and Oder attain their highest availability for navigation, as they flow over the plain gently sloping to the north and northwest. In the northeast are the Vistula, Pregel, and Memel (Niemen), the first and last entering the country from Russia. Naturally the canal system of the Empire has its largest development on the Plain of Prussia, where these artificial highways may most easily be constructed. (See GERMANY for rivers, canals, and lakes.) All the great rivers of the plain receive their large tributaries from the east, so that their courses are near the western limits of their drainage systems.

CLIMATE AND SOIL. The differences of temperature between Prussia and South Germany are not great, the southern States being much more elevated. In winter the south in the same longitude is no warmer than Western Prussia, which has the ameliorating influence of the North Sea. The temperature differences are greater between the west and the east of Prussia, as the

continental influences are intensified toward the east. The Rhine Province is the warmest part and the Baltic lands are the coldest parts of Prussia. There is sufficient rainfall for agriculture, the precipitation being quite evenly distributed and averaging 21 inches per annum, and being as high as 30 inches or more near the North Sea. (See GERMANY, paragraph on *Climate*.) The soils are best in the Rhine Province, but the sandy plain is poor in plant food and is made highly productive only by the most scientific methods of fertilization. Sixty-three per cent. of the soil is poor or mediocre sandy loam or sand, 6 per cent. is bog or marsh, and 29 per cent. is good loam or clay. For **FLORA** and **FAUNA**, see GERMANY.

GEOLOGY AND MINERAL RESOURCES. The whole plain is strewn with sand and clay of Quaternary age that have been spread over the surface by glacial and alluvial action from the Ice Age till the present time. These deposits rest upon areas of all formations from the Primary down through the Tertiary, small parts of these harder rocks projecting here and there above the diluvium and alluvium, as, for example, the chalk cliffs of Rügen and the limestone plateau to the east of Berlin near Riddersdorf. In the southeast, the mountains of Silesia are chiefly composed of granite, gneiss, and schists, while the highlands of the Harz and the lower Rhenish Plateau are composed almost entirely of Devonian and Silurian rocks. Prussia ranks among the great mining countries and leads the German States in value of mineral product. Ninety per cent. of Germany's coal comes from Prussia, chiefly from Silesia, Westphalia, and the Rhine Province. Lignite is extensively mined in the Province of Saxony. The output of coal in 1900 was 101,966,158 tons (metric), and of lignite 34,007,542 tons. Westphalia, Silesia, Hanover, and Hesse-Nassau are the sources of Prussian iron, the output of pig iron in 1900 amounting to 5,781,893 tons (metric). Upper Silesia is the world's largest source of zinc, and the output in 1900 was 155,760 tons. Copper-mining in that year yielded 32,181 tons, and lead 115,105 tons. The total value of mining products in 1900 was 1,096,087,900 marks, and of the smelting products 584,513,724 marks. See GERMANY, paragraph on *Geology and Mineral Resources*.

AGRICULTURE. Prussia is the most important agricultural State of the German Empire, containing about two-thirds of the entire cultivable area. In 1895 the number of acres under cultivation was 70,344,953. Though Germany is one of the European countries in which most of the agricultural holdings are divided among small owners, there are more large estates in Prussia than in any other part of the Empire. They are especially numerous in the eastern provinces, where the land system is much like that of neighboring Poland, in which the country districts are still divided to a large extent among the gentry. In the same way many of the old landed gentry of Prussia still live on estates embracing 2,500 acres or upward; and the estates above 500 acres each aggregate about one-fifth of the land held in agricultural holdings. On the other hand, small holdings (from 5 to 250 acres) vastly predominate in the west and centre, though also numerous in the Province of East Prussia. In spite of the fact that Germany has become a manufactur-

ing rather than an agricultural nation, the farmers of Prussia are in a fairly prosperous condition, owing to intensive cultivation of the land, the fostering care of every agricultural interest both by Imperial and royal legislation, and the use of excellent farm machinery. Among the later developments of Prussian agriculture is the association of neighboring farmers for the purpose of buying machinery run by electricity, alcohol, or other artificial motive power for plowing, threshing, grinding grain, and many other purposes. Prussia leads the world in the use of alcohol as steam-producing fuel, the alcohol being chiefly produced from its potato crop.

All the common agricultural products are raised in Prussia. The provinces of East and West Prussia, Posen, Pomerania, and Hanover are most important agricultural sections, not only of Prussia, but of Germany as well. Prussia produces more than three-fourths of the entire rye crop of Germany (the chief food of the peasantry and most important cereal in the Empire), in addition to 70 per cent. of the potato crop (a large amount of it turned into alcohol for fuel and illumination), 60 per cent. of the wheat crop, 65 per cent. of the oats crop, and over 80 per cent. of the beet crop. Rye and wheat are raised all over the kingdom; oats chiefly in East Prussia, Hanover, the Rhine Province, and Silesia; and barley chiefly in Silesia and Saxony. The greater part of Germany's beet crop is grown on the plains of Prussia from the Harz Mountains to Silesia. The vineyards of Prussia cover an area exceeding 45,000 acres and yielded in 1900 6,752,000 gallons of wine. Fruit culture, including all the fruits of the temperate zone, is highly developed, and the fruit trees in 1900 numbered 90,220,375.

The area under the principal crops in 1900 (in acres) and the yield (in metric tons) are shown in the following table:

	1900	
	Area	Yield
Rye.....	11,277,340	6,370,989
Oats.....	6,710,930	4,631,640
Wheat.....	2,999,860	2,390,578
Barley.....	2,196,731	1,649,982
Potatoes.....	5,477,095	27,564,406
Hay.....	7,992,873	10,934,739

Prussia is the leading German State in the number and quality of live stock. The breeding of horses is extensively carried on in the provinces of East and West Prussia and Hanover; while many cattle are bred along the North Sea and in Saxony, the region of the marshes, drained and otherwise improved, being particularly favorable for cattle-raising and the dairy industry. Pomerania is well known for its sheep. Goats are found in great numbers, especially in the eastern provinces. In 1900 the domestic animals included 2,913,003 horses, 4702 asses and mules, 10,865,296 cattle, 6,989,430 sheep, 10,954,002 swine, and 1,998,692 goats. The fact that the kingdom has now only about one-third as many sheep as in 1873 is chiefly due to two causes: the decline in the price of wool and the subordination in Germany of agriculture to manufacturing industries, hundreds of thousands having abandoned the farm for the factory, and pastures having been turned into fields to raise food for the growing industrial towns. The result is that Prussia

needs to import large quantities of wool for its factories. A large part of the cavalry horses in the German army come from Northeast Prussia, and the Prussian Government, through the stud farms which it maintains, about 20 in number, exerts great influence on the scientific breeding of horses.

About 23 per cent. of the area of Prussia is under forests. Only a little over one-half of the total forest area is in private hands, and private ownership is constantly declining. The remainder is held by the State and local governments, the State controlling about two-thirds of the area. The largest forests are in Brandenburg, Silesia, and the Rhine Province, while Hohenzollern and Schleswig-Holstein are almost entirely devoid of woods. Nearly one-third of the forest area is under coniferous trees, the remainder being under deciduous trees; the former predominate in the north. The Prussian Government derives a revenue of about \$20,000,000 a year from the forest industry. See GERMANY, paragraphs on *Agriculture*, *Stock-Breeding*, and *Forestry*.

MANUFACTURES. The increase from 1882 to 1895 in the number of persons employed in the Prussian manufacturing industries was over 33 per cent. The textile industries thrive in Rhenish Prussia, noted for its cotton spinning and weaving, and for its woolen and silk products, and Silesia, known both for its cotton and linen manufactures. Aachen (Aix-la-Chapelle) and its district are a great seat of the woolen manufacture, and Krefeld and Elberfeld are noted centres of the silk industry. Berlin and Rhenish Prussia and some of the largest cities in other sections of Prussia turn out most of the machinery and metal work. The iron and steel industry is on a vast scale, and is chiefly centred in the coal field of the Ruhr. Large amounts of the pig iron and steel made in that region are sent to machine shops in various parts of the country for conversion into a great variety of articles. The most famous iron and steel works are at Essen. Ship-building is a very important and growing industry in the cities of Kiel, Danzig, Stettin, and Elbing. Car and wagon works centre largely in the eastern cities of Breslau and Königsberg, besides Cologne, Düsseldorf, and Görtitz. Glass and porcelain ware and pottery are produced in Rhenish Prussia, Silesia, and Saxony; the same is true of paper. The chemical industry is especially important in the Rhine cities, and is also prominent in Berlin. See GERMANY, paragraph on *Manufactures*, and the articles on the provinces and leading cities.

	1882	1895
1. Mining and smelting.....	359,177	458,504
2. Quarries and potteries.....	216,931	314,258
3. Metal industry.....	285,112	383,932
4. Machine and instrument making.....	200,528	329,404
5. Chemical industry.....	38,722	66,661
6. Textile industry.....	428,543	441,885
7. Paper industry.....	48,856	72,250
8. Leather industry.....	68,354	86,692
9. Wood-working.....	253,925	322,989
10. Manufacture of food products (including beverages).....	393,105	586,353
11. Clothing industry.....	741,142	800,427
12. Building trades.....	331,338	596,690
13. Printing and publishing trades.....	35,970	67,539
14. Artistic trades.....	7,672	9,503
15. Manufacture of lighting material—soaps and fat.....	24,399	35,038
Total.....	3,433,774	4,572,125

Out of a total of 8,000,503 persons engaged in the manufacturing establishments of Germany in 1895, 4,572,125, or 57 per cent., were employed in Prussia. They were distributed among the foregoing industries (the figures of 1882 being also given for purposes of comparison).

TRANSPORTATION AND COMMUNICATION. One of the greatest factors in the industrial development of Prussia has been the excellence of its inland water routes and railroad lines, which supplement instead of rivaling one another. An enormous tonnage is carried on the great rivers, on their canalized tributaries, and on the canals, which connect the rivers, so that the waterways as well as the railroads gridiron Prussia, serving commerce between the east and west as well as between north and south. Steel lighters of large tonnage and small draught have replaced heavy wooden boats on the canals. The Government expends enormous sums in the improvement and maintenance of the waterways. In the thirteen years ending in 1903, the public treasury disbursed \$58,388,750 on the rivers, canals, and wagon roads, and new canal projects or river improvements are constantly under way. The Kaiser Wilhelm Canal saves two days of steam travel between Hamburg and the Baltic ports as compared with the old route around Jutland.

The Prussian railway system covers not only the entire territory of the kingdom, but also that of several minor German States, thus commanding the commerce of all Northern Germany. Since 1897, when the Prussian railway system was combined with that of Hesse, Prussia has effected an entrance into the southern territory of Germany. (See GERMANY, paragraph on *Railways*.) In 1902 there were 21,110 miles of railroad in operation in Prussia, of which the State owned or administered 19,440 miles. Government ownership and operation has proved a complete success from a financial and commercial point of view. The Government derives nearly one-fourth of its entire revenue from the profits of its railway operation, and is able by the manipulation of freight rates to come to the aid of industries in need of special encouragement.

Prussia is one of the six German States possessing a merchant marine. It ranks third, being exceeded by Hamburg and Bremen. Stettin, the largest Prussian port, is far behind. The Baltic ports are frozen over in winter, but that of Stettin is kept open by ice-breakers. It is the nearest port to Berlin, and one of the present canal projects is to connect them by a waterway. Danzig is a large outlet for the cereals of North-east Prussia. Other important seaports are Königsberg, Memel, and Altona. The merchant marine in 1900 comprised 531 steamers, of 193,411 tons net capacity, and 1543 sailing vessels, of 76,893 tons. Prussia carries on about one-third of the total German foreign trade.

COMMERCE. The commerce of Prussia is facilitated by her central position and by the network of river and canal navigation, which make her territories the connecting medium between several of the great European States, and give her a free outlet to the rest of the world. Yearly markets are held in about 2700 towns. See GERMANY, paragraph on *Commerce*.

BANKING. The banking system of Prussia does not differ from that of the rest of the German Empire. (See GERMANY, paragraph on *Banking*.)

The Imperial Bank acts as the fiscal agent of the kingdom. Prussia occupies a commanding position in the banking world of Germany, since Berlin is the most important financial centre of the country. The eleven great corporate banks of Berlin (not including private banks like Bleichröder, etc.) do almost as great a business as the Imperial Bank of Germany, with its 300 branches. In the closing year of the nineteenth century the combined volume of business done by the Berlin banks was about 155,000,000,000 marks (nearly \$39,000,000,000), as compared with 180,000,000,000 marks done by the Imperial Bank. The capital stock of the eleven banks of Berlin has increased about five-fold since their foundation, and the combined volume of business, estimated at about 155,000,000,000 marks (allowing 20,000,000,000 for the three banks not reporting), was about 138 times as large as their available working capital. The leading bank is the Deutsche Bank, with a capital stock of 150,000,000 marks. Each of the Berlin banks shows a larger capitalization than that of any national bank in the United States and compares very favorably with the banks of France. An important financial institution is the Prussian Maritime Association (*Seehandlung*), founded by Frederiek the Great in the middle of the eighteenth century. It was the chief financial support of the Prussian Government for more than a century, until the formation of the German Empire, and was intrusted with the investment of the enormous war contribution exacted from France. It is the prototype of the 'credit mobilier' institutions which found such favor during the nineteenth century in France and other countries. Its activity may be seen from the fact that with a capital stock of less than 39,000,000 marks it had assets exceeding 520,000,000 marks.

FINANCES. Prussia has a highly scientific and satisfactory revenue system. Taxation, though somewhat burdensome, is very equitably distributed. Direct taxes bring in nearly 10 per cent. of the revenue from all sources and 71 per cent. of the entire tax revenue. The principal direct tax is the progressive income tax. Persons deriving less than a fixed minimum income are exempt. Another important source of revenue in Prussia is the income obtained from Government domains and industrial enterprises, railways, mines, salt works, mills, etc. The net revenue derived from these sources exceeds 650,000,000 marks. The chief item of expenditure in the Prussian budget is the so-called working expense in connection with Government enterprises. The next item is the contribution to the Imperial funds, which every State is required to make to complete the revenue of the of the Empire. (See GERMANY, paragraph on *Finance*.) Next come the interest on the public debt, which absorbs nearly 10 per cent. of the ordinary expenditure; public instruction and worship, with 6 per cent.; justice; and finance. The other items of expenditure are all below 100,000,000 marks, and the war expenditure is insignificant, about \$30,000 in 1902, all the war expenditure being met directly from Imperial funds. The growth of the Prussian budget in the last quarter of the nineteenth century is shown by the following table (in millions of marks).

The public debt of Prussia has grown to enormous proportions. In 1867 it was 1,323,000,000 marks; in 1881, 1,995,000,000; in 1891, 5,205,

000,000; and in 1901, 6,603,000,000. A great part of the debt, however, has been incurred for productive enterprises, such as railways, mines, and domains, which have furnished their own means of liquidation. The service of the debt, including interest and amortization charges, amounted to nearly 273,000,000 marks in 1901, or about \$68,000,000.

	Revenue	Expenditure	Surplus
1875.....	971.6	812.6	159
1885.....	1,441.5	1,376.4	65.1
1895.....	2,260.6	2,116.9	143.7
1900.....	2,472.3	2,472.3

POPULATION. The population of the Kingdom in 1900 was 34,472,509, distributed among the provinces as follows:

PROVINCES	Area in sq. miles	Population, 1890	Population, 1900
East Prussia.....	14,282	1,958,663	1,996,626
West Prussia.....	9,854	1,433,681	1,563,658
Berlin.....	25	1,578,794	1,888,848
Brandenburg.....	15,381	2,541,783	3,108,554
Pomerania.....	11,628	1,520,889	1,634,832
Posen.....	11,184	1,751,642	1,887,275
Silesia.....	15,568	4,224,458	4,668,857
Saxony.....	9,750	2,580,010	2,832,616
Schleswig-Holstein.....	7,340	1,219,523	1,387,968
Hanover.....	14,869	2,278,361	2,590,939
Westphalia.....	7,803	2,428,661	3,187,777
Hesse-Nassau.....	6,000	1,664,426	1,897,981
Rhine Province.....	10,423	4,710,391	5,759,798
Hohenzollern.....	441	66,085	66,780
Total.....	134,548	29,957,367	34,472,509

The greatest increase of population was in the industrial provinces of Westphalia, the Rhine Province, Brandenburg, and Silesia, where the iron and textile works have multiplied. The effect of industrial development on the growth and distribution of the population may be also seen from the changes in the proportion of urban and rural population. In 1890, 51.5 per cent. lived in villages, and 48.5 per cent. in towns and cities of more than 2000 population. In 1900 the rural population comprised but 44.4 per cent. of the total. Berlin is the capital, ranking third in population among the cities of Europe. The seven largest cities after Berlin, with a population exceeding 200,000, are Breslau, Cologne, Frankfurt, Hanover, Magdeburg, Düsseldorf, and Stettin. See GERMANY, paragraph on *Population*.

For ARMY and NAVY, see the articles ARMIES and NAVIES.

GOVERNMENT. The present Constitution of Prussia is a written instrument and one of the products of the revolutionary events of 1848. It was promulgated by the King in 1850 and has since been modified by various royal decrees. It prescribes a number of limitations in behalf of individual liberty upon the power of the Government. It may be amended by the King and the Legislature according to the ordinary processes of legislation, except that the resolution for amendment must be twice passed by the Chambers, an interval of three weeks intervening between the two votes.

The executive power is vested in the King, who attains his majority at eighteen, and whose crown is hereditary according to the principle of agnatic

lineal primogenial succession. He is irresponsible and exercises his powers through ministers, who must countersign all his official acts and who thereby assume responsibility for them. Their responsibility, however, is not to the Legislature, but to the King, who appoints and dismisses them without regard to the wishes of the Legislature. They are entitled to seats in either Chamber and may participate actively in the debates, but can vote only in the House in which they have a seat. They do not resign upon an adverse vote, for the parliamentary or cabinet system of government does not exist in Prussia. The number of ministers as well as their duties is regulated by the King. At present there are nine. None of them acts as Prime Minister with authority over the others, although the Minister of Foreign Affairs, as chairman of the Council of Ministers, is called the Minister president. Their responsibility is not collective, and each conducts his own department independently of the others. However, they meet occasionally as a *Staatsministerium* for the consideration of matters of general concern, for the discussion of proposed legislation, for the preparation of ordinances to meet temporary exigencies during the adjournment of the Legislature, etc.

The legislative power is vested in the King and a bicameral legislature (*Landtag*), the two Chambers having substantial equality of powers in legislation. The House of Peers (*Herrenhaus*) consists of three hereditary groups: (1) Adult princes of the royal blood; (2) princes of mediatized houses; (3) territorial nobles, and the following non-hereditary elements: (1) Life peers, appointed by the King from among certain wealthy and distinguished persons; (2) eight noblemen elected by certain Prussian landowners; (3) representatives of the universities, of evangelical bodies, and of certain cities; and (4) an unlimited number of worthies appointed by the King for any term he pleases. The total number of members at present is about 300, of whom about two-thirds are representatives of large land-owning classes. The House of Representatives (*Abgeordnetenhaus*) is composed of 433 members, elected for a term of five years by indirect vote. For the purpose of election the country is divided into districts, in each of which usually one member is chosen by the three-class system. Under this arrangement of each district the voters (all Prussians twenty-five years of age and qualified to vote in the municipal elections) are divided into three classes according to the amount of taxes they pay: the largest taxpayers, who together pay one-third of the taxes, constituting the first class; the next highest taxpayers, who together pay another third, forming the second class; and the remaining taxpayers forming the third class. Each class of voters then chooses an equal number of electors, who then assemble and choose the representative. Thus it is seen that the moneyed class have a most decided advantage. One elector is chosen from about 250 of the population and representatives are distributed on the basis of one for about 75,000 inhabitants. The qualifications for membership in the House of Representatives are the completion of the thirtieth year, the full enjoyment of civil rights, and the payment of all taxes assessed for the three years previous. The Parliament is regularly convoked by the King each year in November and in special session at such

other times as he may choose. It is also opened, prorogued, dissolved, and adjourned by the King, but cannot be adjourned for a longer period than thirty days or more than once during the session. Each House is the judge of the elections and qualifications of its own members and has full power over its organization, procedure, and discipline except that the sessions must be public. The members cannot be questioned outside of their respective Chambers for any speech delivered or vote cast therein, nor be arrested without the consent of the Chamber unless caught in the act of committing a crime or within twenty-four hours thereafter. The members of the House of Representatives receive as compensation about three dollars and a half a day. In legislation the powers of the two Chambers are equal, except that the budget and revenue bills must originate in the House of Representatives and cannot be amended by the Peers.

The organization, jurisdiction, and procedure of the judicial system, as in all the German States, is regulated by the Imperial Judicature Act of 1877. The territorial competence of the courts and the appointment and compensation of the judges, however, is a matter of State regulation. The Prussian Constitution requires that the judges shall be appointed by the King for life, and they can be removed, retired, or transferred to other districts only by resolution of the courts themselves. Their position is one of independence as over against the Administration. They are admitted to the judicial service only after the completion of a prescribed course of study and preparatory service and after passing two State examinations. The highest courts in Prussia are the *Oberlandesgerichte*, of which there are fifteen in number, the one at Berlin being known as the *Kammergericht*. The next lower grade of courts are the *Landesgerichte*, and at the bottom of the judicial hierarchy are the *Amtsgerichte* or magistrates' courts. For the trial of minor criminal offenses the magistrate associates with himself two laymen called *Schöffen*. For the trial of more serious offenses jury courts (*Schwurgerichte*) are constituted in connection with the *Landesgerichte*. They consist of a bench of three judges and twelve jurors, the latter being selected from a list of eligibles prepared before the beginning of each year. The Imperial Court at Leipzig serves as a final court of appeal from the State courts. (For a more detailed account of the judicial system, see GERMANY.) Besides the ordinary courts mentioned above there are a number of special courts (*besondere Gerichte*), which the individual States may or may not establish. Such are the industrial courts, the communal courts, agrarian courts, etc. Moreover, as a result of the so-called separation of justice from administration in Prussia in the early part of the nineteenth century, Prussia has a system of administrative courts charged with the adjudication of administrative controversies. As a result of the legislation of 1875 there are three grades of administrative tribunals, viz. the Superior Administrative Court (*Oberverwaltungsgericht*), the Circle Committee, and the District Committee. The first mentioned is composed of an equal number of judges and trained administrators appointed by the King for life, thus insuring them a position of greater independence than is the case with the judges of the French administrative

courts. This court has its seat at Berlin and is a tribunal of great influence and popularity. To settle conflicts of jurisdiction that arise between the judicial and administrative courts a 'competence conflict' tribunal is provided. This court has its seat at Berlin and consists of eleven members, six of whom are judges of the *Oberlandesgericht*.

The present system of local government in Prussia dates back to the year 1807, but has undergone numerous reforms, culminating in the noted *Kreisordnung* of Professor Gneist, which became law in 1872. As a result of this legislation the sphere of local autonomy was extended, a judicial control over the action of the administrative authorities was provided for, with a view of preventing abuses which had become quite frequent, and a large non-professional service, for the most part compulsory and unpaid, was introduced into the administration with a view of diminishing the influence of the bureaucracy, and at the same time of increasing the political capacity of the people, who were shut out from the civil service on account of its highly professional character and the consequent difficulty of gaining admission thereto. A distinctive principle of Prussian administration is the separation of local activities into two classes: those which are regarded as of general concern, such as the management of schools, police, and religious worship; and those of purely local concern, such as the management of highways, the care of local institutions, etc. For the administration of the first class the State is divided into administrative units, in each of which are to be found central officers under control of the Ministers at Berlin. For purely local administration there are local corporations with their own property and officials. The late reforms have in most cases made the boundaries of the central and local units conterminous and consolidated the central and local authorities in the same area.

For the purpose of administration, Prussia is divided into twelve provinces, not artificial, but historical units. These are subdivided into Government districts (*Regierungsbezirke*), from two to six in each, thirty-five in all. The districts are divided into circles (*Kreise*). Below the circle are the justice of the peace district (*Amtsbezirk*) and the commune (*Gemeinde*). In the province there are two sets of Government officials, one central and the other local. The chief central officer is the *Oberpräsident*, a purely professional official, somewhat like the French prefect, appointed and dismissed by the King and subject to the oversight and direction of the Ministers at Berlin. He exercises supervision over a number of subordinate officials, presides over various boards, and attends to the administration of those affairs which concern the province as a whole, such as relate to the police, religious worship, schools, public health, etc. Associated with the *Oberpräsident* in the administration of matters of central concern in the province is the provincial council (*Provinzialrat*), consisting of the *Oberpräsident* as Chairman, a professional life member appointed by the Minister of the Interior, and of five unsalaried lay members chosen by the Provincial Committee (a popular body) for a term of six years. The council exercises a certain control over the *Oberpräsident*; its consent is necessary to the validity of his ordinances; it hears appeals

from the decisions of certain lower organs, and performs a variety of miscellaneous duties.

The organs for the administration of matters of purely local concern in the province are the Provincial Diet (*Landtag*), the Provincial Committee, and the Director. The Landtag is the legislative assembly of the province and is composed of members elected for a term of six years by the Diets of the rural circles and by the municipal councils of the urban circles within the province. They are distributed among the circles of the province on the basis of population and one-third retire every third year. The Landtag is summoned in regular session by the Crown biennially, and oftener when necessity requires. Its duties relate to the organization and management of provincial institutions, the election of local officers, the voting of appropriations and taxes, and the enactment of by-laws on various subjects. The Provincial Committee is the local executive authority for the province and is composed of from seven to fourteen unsalaried members elected by the Landtag for a term of six years. Its chief duty is the enforcement of the measures of the Landtag, and the chief officer through whom it acts is the director, a salaried ministerial official elected by the Landtag and confirmed by the King. It will be seen from the above description of the provincial administration that a complete separation of the provincial and local functions of administration is observed.

The Government district, unlike the province, exists only for the administration of those affairs which are regarded as being of general concern, and it has, therefore, no organs for the administration of purely local matters. In each of these areas is a board consisting exclusively of professional administrators appointed by the King, collectively known as the government (*Regierung*) and having at its head an officer called the government president (*Regierungspräsident*). This official is in some respects the most important in the Prussian local administration. He may veto or set aside the resolutions of the government (*Regierung*), and is the real head of the local service. The duties of the 'government' fall chiefly within the domain of the Ministries of the Interior, of Agriculture, of Public Works, of Trade and Commerce, of War, and of Education and Worship, to all of whom they are responsible. Another organ of the Government district is the District Committee (*Bezirksausschuss*), composed of the government president, two professional members appointed by the King for life, and four laymen chosen by the Provincial Committee for a term of six years. The chief function of this predominantly lay authority is to exercise control over the action of the professional government president. Its consent is necessary for the validity of his police ordinances; it exercises supervision over subordinate officials, and acts as an administrative court for the district.

As to the circle (*Kreis*), there is found again, as in the province, the distinction between those affairs which are regarded as of general concern and those which are looked upon as of purely local interest. The matter is, however, somewhat simplified by intrusting to one set of organs the administration of both spheres, but when they act as central organs they are subject to strict central control. These are the Landrat, the Circle Committee (*Kreisausschuss*),

and the Circle Diet (*Kreistag*). The Landrat is the chief executive authority of the circle and the agent of the central administration. He corresponds somewhat to the Oberpräsident of the province and the government president of the district. When acting as agent of the central administration he is the subordinate of the latter official, but when acting as a purely local officer he is a subordinate of the Circle Committee. He is a highly trained professional administrator and is appointed by the King. The Circle Committee is composed of the Landrat and six non-professional members elected by the Circle Diet for a term of six years, and acceptance of the office is compulsory. As a central organ it exercises oversight over the justices of the peace; as a local organ it has supervisory authority over other officers of the circle. It is also the administrative court for the circle, and in this capacity hears appeals from the acts of inferior administrative officials. The Circle Diet is the representative assembly of the circle and is composed of members elected for a term of six years, one-half of whom retire every three years. They are distributed equally between the urban circles (cities with over 25,000 population) and the rural circles. The members assigned to the urban circles are elected by their municipal authorities. Those assigned to the rural circles are again divided between the greater landowners and the rural communes. The greater landowners form themselves into electoral colleges for the choice of their members, while the rural communes elect theirs in groups and also through electors. The Circle Diet elects the members of the Provincial Diet, votes the provincial taxes, contracts loans, enacts ordinances for the administration of various local affairs, and has power to create certain offices and establish local institutions.

The justice of the peace district (*Amtsbezirk*) consists of a group of rural communes with a population of about 1500 inhabitants. The justice (*Amtmann* or *Amtsvorsteher*) is appointed by the King upon the nomination of the Circle Diet for a term of six years, and the office is compulsory and unpaid. The duties of the justice include the control of the local police and the administration of the poor and health laws. The office is therefore one of the most important in the system.

As to the communes, there is found a distinction between those which are rural and those which are urban. The larger rural communes act through representative councils chosen by taxpayers, while the less populous manage their affairs through mass meetings of the voters. The chief executive officer in the commune is known as the *Schulze* or *Dorfrichter* and is elected for a term of six years by the communal council or mass meeting. Communal affairs include the regulation of pasturage, tillage, schools, churches, etc.

In the government of the cities of Prussia the deliberative organ is the council, chosen for a term of six years by the taxpayers according to the three-class arrangement already described in connection with the Prussian House of Representatives. Its powers are not specifically enumerated, but comprise the general administration of city affairs. It may, therefore, undertake whatever municipal enterprise it chooses. The chief executive authority in the

city is vested either in a burgomaster or a board elected by the council. The burgomaster is a professional officer, while the board is composed of both professional and lay members, the service of the latter being obligatory and unpaid. Where the board system prevails the burgomaster serves as chairman of the board. He is a high-salaried official with a tenure of at least twelve years, and occupies a position of great influence. In the city we find again the separation of those matters which are of central concern from those of purely local interest, but, as in the circle, the authorities for the administration of both spheres are consolidated. In the large cities, however, the central Government may, if it wishes, vest the control of the police in distinctively central organs, and this it has done quite generally. The executive board acts both as an organ for local administration and as an organ for central administration, and in the latter capacity it is subject to the supervision of the central Government at Berlin. By way of conclusion, it may be remarked that the general characteristics of Prussian local government are: first, the local authorities are for the most part organs of general rather than enumerated powers, but to counteract possible evil results they are subjected to central control; second, the administration is subject to judicial control as a means of protection to the individual; third, a large part of the administrative service is highly professional in character and can be entered only as a result of special study and training and after passing a State examination; fourth, to counteract the possible evils of the bureaucracy, a considerable lay element, whose services are generally obligatory and unpaid, has been introduced into the system.

ETHNOLOGY. The inhabitants of modern Prussia are, for the most part, German-speaking descendants of the old Teutonic tribes, mixed more or less with Celts in the west and southwest and with Slavs in the east. There are two important branches to be recognized which differ in customs and speech, and possibly in descent. These are the Low Germans and the High Germans, occupying, respectively, the low-lying plains to the north and the higher regions to the south.

In addition to the German-speaking population there are a large number of Slavs in the eastern part of the kingdom, a considerable body of Danes in Schleswig, a number of Lithuanians in the northeast, of Frisians in the northwest, and of Dutch in the west, and a few representatives of Celtic peoples (French and Walloons) in the west. Of the Slavs the most important are the Czechs, the Wends, and the Poles. The Czechs are found in Silesia, and the Wends in Brandenburg and Silesia. Akin to the Wends, but speaking a Polish dialect, are the Kassubs, or Kashubs, dwelling in the northwest part of the Province of West Prussia and in Pomerania. These form a small remnant of the old Slavic Pomeranians, who formerly occupied this region, but have been largely absorbed in the surrounding Teutonic element. The Poles, some three millions, form the largest body of Slavs in Prussia. They dwell in Posen, Silesia, and East and West Prussia. Related to the Poles are the Mazurians or Mazurs, who dwell in the southeastern portion of East Prussia, and still preserve their old cus-

oms and habits. The old Prussians, the original inhabitants of Prussia east of the Vistula, who preserved their independence until they were subdued by the Teutonic Knights in the thirteenth century, have died out or been absorbed, and their language is no longer spoken. The Jews number about 400,000, of whom about one-fourth dwell in Berlin.

HISTORY. The origins of Prussian history up to 1411 are sufficiently treated under BRANDENBURG (q.v.). In that year the Emperor Sigismund placed over the Mark of Brandenburg the thrifty Frederick, Burggrave of Nuremberg, who was invested four years later with the hereditary sovereignty of the mark and the accompanying dignities of margrave, prince elector, and Imperial arch-treasurer. This Frederick was the head of the House of Hohenzollern (q.v.) and with him began its steady rise to power. He was a capable administrator and brought order out of the existing chaos. The work was continued by his son, Frederick II. (1440-70). Frederick was succeeded by his brother, Albert Achilles (1470-86), who fell not at all behind his father and brother in ability. In the *Dispositio Achilica* of 1473 he ordained that the Franconian margraviates (Bayreuth and Ansbach) should be separated from Brandenburg. There now began those family arrangements by which lesser territories, reserved for younger sons or acquired by marriage, were to revert to the elder line in default of other heirs. John Cicero (1486-99) and Joachim I. Nestor (1499-1535) followed, without especially distinguishing themselves, but maintaining the gains of their house. The son of the latter, Joachim II. Hector (1535-71), adopted the reformed religion in 1539, thus bringing himself into sympathy with his people, who in common with all of North Germany were embracing Protestantism. He and his successors, John George (1571-98) and Joachim Frederick (1598-1608), were, however, too cautious to involve Brandenburg in the Reformation struggles. The important event in the reign of John Sigismund (1608-19) was the reversion of the Duchy of Prussia (the region about Königsberg) to the electoral branch in 1618.

In the early part of the thirteenth century, when hope of further achievements in Syria had declined, the crusading order of the Teutonic Knights (q.v.) turned to the task of conquering and Christianizing by the sword the heathen of the countries on the southern and eastern shores of the Baltic. Remorselessly but with tremendous energy they spread their conquests over Prussia, Pomerania, Courland, Livonia, and Estonia, establishing towns, colonizing, and enforcing conversion upon the conquered inhabitants. The Prussians (Borussians), a people closely akin to the Lithuanians, who inhabited the Baltic region between the Vistula and the Niemen (Memel), offered a fierce resistance, and their subjugation was not completed until after a long struggle in 1283. The Prussian nationality was gradually swallowed up in the tide of German colonization, and by the seventeenth century the Old Prussian language was extinct. Power and wealth brought a decline in the vigor of the Teutonic Order and Poland after its union with Lithuania in the fourteenth century (see POLAND) turned its strength against the Knights, against whom war was

waged until in 1466 the Peace of Thorn destroyed the independent sovereignty which the Order had erected. Western Prussia was annexed to the Polish kingdom and Eastern Prussia, much reduced, was retained by the Teutonic Knights as a fief of Poland. In 1511 Albert of the Ansbach branch of the Hohenzollern was elected grand master of the Teutonic Order under a pledge to refuse to do homage to Poland. Finding this impracticable and failing to find support from the members of the Order who were residing elsewhere, he regarded himself as absolved from his pledge, and with most of the Prussian members became Protestant, secularized the State over which he ruled, and received it from Poland as hereditary Duke of Prussia (1525). By agreement with the elder line, upon the failure of heirs in the line of Duke Albert the Duchy of Prussia in 1618 was added to the domains of the Brandenburg Hohenzollern. In the reign of John Sigismund also the beginnings were made of the dominion of Brandenburg in the region of the Rhine. In 1609 the ducal line of Jülich and Cleves became extinct, and in the succession contest which ensued Brandenburg was one of the claimants. In 1666 Cleves, Mark, and Ravensberg were definitively assigned to her.

During the Thirty Years' War (q.v.) Brandenburg was wasted by the contending armies, although the Elector George William (1619-40) temporized with both sides in a vain endeavor to follow the peaceable and thrifty policy of his predecessors. It was, therefore, a devastated and impoverished country to the sovereignty of which Frederick William I., "the Great Elector" (1640-88), succeeded. He was the first of the three creators of the greatness of modern Prussia. He saw the necessity of making Brandenburg a military State, because of its central and exposed position. He brought a small army into existence, was able to command a hearing in the Westphalian peace negotiations, and secured for Brandenburg by his shrewd diplomacy Farther Pomerania (the line of Slavic dukes of Pomerania having become extinct in 1637), the sees of Halberstadt, Minden, and Kammin, and the succession to the See of Magdeburg (1648). In 1656 he joined Charles Gustavus of Sweden in his onslaught upon Poland, but in 1657, with his customary shrewd regard for the interests of his house, he changed sides, and for his espousal of the Polish cause he obtained from Poland in the Treaty of Wehlau, in the same year, a renunciation of her suzerainty over the Duchy of Prussia. In 1675, when the Swedes invaded Brandenburg while Frederick William was campaigning against France on the Rhine, he returned, totally defeated them at Fehrbellin, and drove them out of Pomerania. Although Swedish Pomerania had to be given up in 1679, a new power had demonstrated its claim to be heard in the affairs of the Baltic. When Louis XIV. revoked the Edict of Nantes (q.v.), Frederick William replied by the Potsdam Decree, which made Brandenburg the hospitable asylum for persecuted Protestants and drew to it thousands of French Huguenots, who made most useful citizens. The Great Elector thus prepared the way, during his long reign, for the next great step in the development of his State under his son, Frederick III. (1688-1713). The Margraviate of Brandenburg was a vassal State of the Holy Roman Empire; the Duchy of Prussia had been

made an independent sovereignty, but its sovereignty, as a duke, occupied an inferior rank. When the Emperor, Leopold I., entered upon the struggle of the Spanish Succession he was anxious to secure the support of the German princes, and he consented, against the advice of some of his shrewdest counselors, to allow his vassal, the Elector of Brandenburg, to erect ducal Prussia, which was outside the Empire, into a kingdom (November 16, 1700). Frederick III. of Brandenburg placed the royal crown upon his head at Königsberg on January 18, 1701, and thus became King Frederick I. of Prussia. As such he was placed on a level with the other independent sovereigns of Europe, and from this time Brandenburg-Prussia had to be reckoned with as a European power.

The reign of Frederick I., aside from this most important achievement, was uneventful. At his death in 1713 he was succeeded by his son, Frederick William I. (1713-40), an eccentric monarch, who practiced the closest economies in administration, established the Prussian bureaucracy on a sound basis, and continued the military development of the country, raising the army to an effective strength of more than 80,000 men, the best disciplined troops in Europe. By the Treaty of Stockholm (1720) he acquired a great part of Swedish Pomerania, including Stettin. He fought no wars and turned over to his son, Frederick II., "the Great" (1740-86), an efficient military machine and a well-filled treasury. Hitherto the House of Hohenzollern had been steadily loyal to that of Austria. The inevitable rivalry of Prussia and Austria for supremacy in the Germanic body had not made itself apparent. Frederick William saw it just before his death. Frederick clearly understood it, and thereafter it formed the keynote of Prussian policy. Immediately after his accession Frederick made war upon Austria for the possession of Silesia and secured most of that extensive province. The first twenty-three years of his reign were occupied in a great measure by wars in which the well-husbanded resources of the country were taxed to the utmost. (See SUCCESSION WARS; SEVEN YEARS' WAR.) The second period was devoted to the restoration of the country, the establishment of its prosperity on a permanent basis by the cultivation of its material resources, and the thorough organization of its government in all departments. The government was a despotism, although a benevolent one, in accordance with the prevailing ideas of the eighteenth century. The rise of Prussia to the rank of a first-rate power, representing as she did the Germanic spirit, stimulated German thought and patriotism, and prepared the way for the new Germany. By the first partition of Poland the greater part of West Prussia was added to the kingdom, thereby filling the gap between Brandenburg and East Prussia. Frederick's nephew and successor, Frederick William II. (1786-97), took up arms against revolutionary France, and in the Treaty of Basel (1795) had to give up the Prussian territories west of the Rhine. He shared in the second and third partitions of Poland in 1793 and 1795. See POLAND.

Under Frederick William III. (1797-1840) Prussia passed through a period of humiliation and then of reorganization. Napoleon (q.v.) saw in the independent Germanic kingdom a menace to his plans and aimed to crush out its national

life. The attempt of the King to play the old Brandenburg part of a neutral when no power in Europe could be neutral only made the misfortunes of the country greater. In 1806, after the campaign of Jena, Prussia found herself prostrate at the feet of Napoleon. The Treaty of Tilsit (July, 1807) tore away about half of the kingdom—the territories west of the Elbe and the Polish territories acquired in 1793 and 1795. In this crisis the government, organized in a form fast becoming antiquated, had lost its efficiency and degenerated into a helpless bureaucracy under a vacillating king. Then came a great national awakening. Stein, Hardenberg, and Scharnhorst (q.v.) came into the government as ministers and completely reorganized the administration, civil and military, changing Prussia from a mere military monarchy to an armed and organized nation under a monarchical government. In 1809 the last remnants of serfdom, which had been in process of abolition since 1717, were done away with. Fichte began his patriotic propaganda. In 1813, allied with Russia and Austria, Prussia entered upon the War of Liberation, and she was able to take an active and effective part in the campaigns that brought about Napoleon's downfall. In 1815 the Congress of Vienna allowed Prussia (reinstated in most of her old German possessions) only the Province of Posen and the city of Danzig of her share of the second and third partitions of Poland, but in recompense awarded what was of much more value to her as a German State—large territories on the Rhine, half of Saxony, and what was left of Swedish Pomerania. From this time the history of Prussia and that of Germany are inseparable. It became the aim of Prussian statesmanship to unite Germany under Prussian leadership and oust Austria from her presidency of the new confederation. The Zollverein (q.v.), including all Germany except Austria, was a step in this direction; but the inherent jealousies of the German States prevented any further advance.

The years from 1840 to 1861, covering the reign of Frederick William IV. (q.v.), formed a critical period for Prussia. All Europe was stirring with the liberal and constitutional agitation which culminated in the revolutions of 1848. The King of Prussia possessed cultivated tastes, but he proved to be a bigoted adherent of the old order of caste and privilege. He granted a legislative assembly in 1847, but the basis of representation was provincial, not popular. The revolutionary movement was severely felt in Prussia, especially in the great student centres. In Berlin serious rioting culminated in a pitched battle between the populace and the troops on March 18-19, 1848, in the course of which more than 200 men fell in the defense of the barricades. The King yielded, consented to the formation of a national guard, and summoned a Liberal Ministry. On May 22d a constituent convention assembled in Berlin, but its character was so radical that the King, taking advantage of the reaction which had already set in at Vienna, transferred the convention from Berlin to Brandenburg, and on December 5th pronounced its dissolution, publishing at the same time a constitution, based on democratic principles. The old system of different estates was abandoned and a united bicameral

legislature established. In April, 1849, the King refused the Imperial crown offered him by the Frankfort Parliament, on the ground that it did not proceed from the action of the German princes. (See GERMANY.) Frederick William IV. thus destroyed the opportunity of bringing Prussia to the forefront in German affairs. In 1850 he showed, by convoking the Erfurt Parliament to consider anew plans for German unity, that his refusal was but half-hearted. At this time, however, Austria was in a better condition for action, and Schwarzenberg promptly brought about the dissolution of the Erfurt gathering. Prussia was on the verge of war with Austria over the situation in Hesse, when the timidity and vacillation of the Prussian Government again led to a drawing back, and at Olmütz (November 28-29, 1850) Count Manteuffel met Prince Schwarzenberg, acceded to all of Austria's demands, and for the time being destroyed the prestige which Prussia had enjoyed since the days of Frederick the Great. This vacillation ceased when the Crown Prince William became Regent in 1858. Upon the latter's accession to the throne in 1861 Bismarck was called into his councils and speedily became the dominant personality in the German world. He rejected altogether the temporizing and timid policy of his predecessors and made it evident that the regeneration of Germany must be accomplished through Prussian agency and by a policy of force. In 1864 Prussia and Austria engaged in a joint war with Denmark, which resulted in the liberation of Schleswig-Holstein from Danish rule. The differences between the rival powers relative to the disposition to be made of the duchies gave Bismarck his opportunity to force a war with Austria. (See GERMANY; SCHLESWIG-HOLSTEIN; AUSTRIA-HUNGARY.) The Seven Weeks' War (q.v.) followed, in which Prussia had an ally in Italy. By it Austria was forced out of the Germanic body, and Hanover, Hesse-Cassel, Nassau, and Frankfurt were annexed to Prussia, with which Schleswig and Holstein were at the same time incorporated. The North German Confederation was formed under Prussian leadership.

It now remained to bring the States of South Germany into the union. This result was brought about with the same certainty of action that had produced the struggle with Austria. The Franco-German War and the establishment of the German Empire followed. For this series of events, and the history of Prussia to the present time. See GERMANY; BISMARCK; WILLIAM I.; FREDERICK III.; WILLIAM II.; KULTURKAMPF; SOCIALISM; POLITICAL PARTIES (section on Germany, etc.

Droysen, *Geschichte der preussischen Politik* (Berlin, 1876), is a monumental work by one of Germany's foremost historians, but strongly partisan and only practicable for specialists, to whom its merits and defects will be sufficiently familiar. For a detailed bibliography, see Dahlmann-Waitz, *Quellenkunde der deutschen Geschichte* (6th ed., revised by Steindorff, Göttingen, 1894).

PRUSSIA, EAST. The northeasternmost province of Prussia, bounded by the Baltic Sea on the northwest, Russian Poland on the east and south, and the Province of West Prussia on the west (Map: Prussia, K 1). Area, excluding the Frisches and Kurisches Haff, 14,282 square miles. It forms a part of the southern coast plateau of the Baltic Sea, and its surface, largely flat, is interspersed with marshy tracts in the northeast and south, and with dunes along the coast. The southern part is remarkable for its numerous lakes, of which the largest are the Mauer, Spirding, and Löwentin. The chief rivers of the province are the Niemen (here called the Memel), the Pregel, and the Passarge. The larger rivers are navigable, and many of the lakes are connected by canals. The climate is raw. Agriculture is the principal occupation, and rye, oats, barley, wheat, and potatoes are grown. Stock-raising is very important, and the horses of East Prussia are among the best in Germany, horse-breeding being furthered by several large studs.

The forests belong mostly to the State, and are exploited extensively. The manufacturing industries are as yet slightly developed, and most of them are in connection with agriculture, such as brewing, distilling, and the manufacture of beet sugar. Iron is produced in limited quantities, and the manufacturing of textiles is carried on as a house industry. The transportation facilities of the province are very good, there being, besides the extensive system of natural and artificial waterways, 1,375 miles of railway, chiefly State lines. For administrative purposes

East Prussia is divided into the two districts of Königsberg and Gumbinnen, with Königsberg as the capital. The province is represented by 36 members in the Lower House and 24 in the Upper House of the Prussian Landtag, and returns 17 Deputies to the Reichstag. In 1900 the population was 1,996,626 (2,006,689 in 1895), including 1,698,465 Protestants. For history, see PRUSSIA.

PRUSSIA, WEST. A province of Prussia, bounded by the Baltic on the north, East Prussia on the east, Russian Poland and the Province of Posen on the south, and the provinces of Brandenburg and Pomerania on the west (Map: Prussia, J 1). Area, over 9800 square miles. The surface is mostly flat, and in some parts lies below the level of the sea. It is traversed from west to east by a range of hills which reaches its greatest height in the Turmberg, 1080 feet. The chief indentation on the coast is the Gulf of Danziger, which is separated from the sea by the long spit known as Hela Peninsula. The southwestern part of the Frisches Haff also belongs to West Prussia. The province is watered principally by the Vistula and its tributaries, and contains many small lakes. The climate is somewhat raw in the lower parts. Agriculture is the principal industry, and rye, potatoes, and oats are the chief products. Sugar beets and tobacco are produced on a very large scale, and stock-raising is also well developed, the province being noted for its fine horses. The manufacturing industries are as yet unimportant, and are confined entirely to the cities. The principal industries are ship-building, notably at Danzig and Elbing, and lumber manufacturing in many of the cities along the Vistula. Linen and other textiles are produced in the rural districts. The chief article of commerce is lumber, which is imported extensively from Russia to Thorn and Danzig. For purposes of administration the province is divided into the two districts of Danzig and Marienwerder, with Danzig as the capital. It is represented by 22 members in the Lower House and 13 in the Upper House of the Prussian Landtag, and returns 13 members to the Reichstag. The population of the province was 1,433,681 in 1890 and 1,563,459 in 1900. In 1895 the Roman Catholics numbered 758,168 and the Protestants 702,030.

PRUSSIC ACID. See HYDROCYANIC ACID.

PRUTH, прѹт. An important tributary of the lower course of the Danube. It rises in the Carpathian Mountains, on the boundary of Galicia and Hungary, flows through the southeastern part of Galicia, and then forms the boundary line between Bessarabia (Russia) and Rumania, joining the Danube near Galatz (Map: Balkan Peninsula, G 2). Its total length is over 500 miles. Its course is very swift and the river is used principally for floating timber, although it is navigable from Jassy downward for about 170 miles. In 1711 the army of Peter the Great was hemmed in on the bank of the Pruth, near Husi, by the Turks. They finally allowed the Czar to withdraw upon his consenting to give up Azov.

PRUTZ, прѹтс, HANS (1843-). A German historian, born at Jena, son of the following. He studied in Jena and in Berlin, where he established himself as Privat-docent in 1873. The results of an expedition into Syria, undertaken by order of the Government, in 1874, were embodied

in the work *Aus Phönicien* (1876). In 1877 he became professor at the University of Königsberg, and after having resigned his chair, owing to a disease of the eye, settled in Munich in 1902. His principal works include: *Heinrich der Löwe* (1865); *Kaiser Friedrich I.* (1871-74); *Kulturgeschichte der Kreuzzüge* (1883); *Staatengeschichte des Abendlandes im Mittelalter* (1885-87); *Entwicklung und Untergang des Tempelherren-Ordens* (1888); *Aus des grossen Kurfürsten letzten Jahren* (1897); and *Preussische Geschichte* (1899-1902), in which he placed himself in opposition to the delineation of Prussian history as inspired by patriotic tendencies.

PRUTZ, ROBERT (1816-72). A German poet and historian of literature. He was born at Stettin, and studied philology, philosophy, and history in Berlin, Breslau, and Halle. Prutz boldly advocated liberal ideas in science, religion, and politics, and incurred the dislike of the Government in consequence. In 1849, however, mainly as a result of the popularity of his free lectures, he was appointed professor of literature at the University of Halle, and soon had a large following of liberal-minded students, but was so harassed by the Government that he resigned in 1859, and retired to his native place, where he devoted himself entirely to literary pursuits. Besides several volumes of poems, notably *Aus der Heimat* (1858), *Aus goldenen Tagen* (1861), *Herbstrosen* (1865), *Stimmen der Liebe* (1868), he wrote a sparkling comedy, *Die politische Wochenstube* (1843), several dramas, and the novels *Das Engelen* (1851), *Der Musikantenturm* (1855), *Oberndorf* (1862), and others. His writings on literary subjects, which are more important, include: *Der Göttinger Dichterbund* (1841); *Geschichte des deutschen Theaters* (1847); *Geschichte des deutschen Journalismus* (1845); *Die deutsche Litteratur der Gegenwart* (1860) *Ludwig Holberg, sein Leben und seine Schriften* (1853); translations of Holberg's selected comedies (1868); and *Menschen und Bücher, biographische Beiträge zur deutschen Litteratur und Sittengeschichte des 18. Jahrhunderts* (1862). Consult Gottschall, in *Unsere Zeit* (Leipzig, 1872).

PRYDZ, PRUTS, ALVILDE (1850—). A Norwegian novelist. She was born near Frederikshald, in Southern Norway. In 1880 she gained some attention by the story *Agnar og Agnar* (1880). After the publication of *I Moll* (1885) she received a Government stipend and traveled in Denmark, Germany, Switzerland, and Italy. Mention should be made of *Undervejs* (1889); *Arnak* (1892); *Dröm* (1893); *Bellis* (1895); *Guvor Thorsdatter til Haero*, translated into German in 1897 (1895); *Sylvia* (1898); and sketches of travel in the form of fiction, *Blade* (1898).

PRYNNE, HESTER. The heroine of Hawthorne's *Scarlet Letter*, condemned for her sin to wear on her breast the badge which gives the title to the romance.

PRYNNE, WILLIAM (1600-69). An English political polemist and annalist. He was born near Bath, where he received his early education, afterwards proceeding to Oriel College, Oxford, where he took his bachelor's degree in 1621. He early became involved in ecclesiastical controversy, and speedily made himself heard as a champion of the Puritan party in various

pamphlets directed against Arminianism. In 1632 appeared his *Histrionastix, or a Scourge for Stageplayers*, an attack on the popular amusements of the period, which contained presumably veiled attacks on the King and Queen. He was imprisoned in the Tower, underwent prosecution in the Star Chamber, was sentenced to a fine of £5000, degradation from his degrees, and expulsion from Oxford and Lincoln's Inn, the loss of both his ears in the pillory, and to have his book burnt in public by the hangman. He was also condemned to perpetual imprisonment, and was reimprisoned in the Tower. Three years after, he found means to publish from his prison another pamphlet, in which he fiercely attacked the hierarchy, and was unsparing in his abuse of Laud and other bishops. For this he was again prosecuted, another fine of £5000 was imposed, he was again pilloried, losing such stumps of ears as the executioner had before spared, and was branded on both cheeks with the letters S.L.—seditious libeler—which he ingeniously interpreted as 'stigmata Laudis.'

He remained a close prisoner till in 1640—the Long Parliament then sitting—he was released by a warrant of the House of Commons, and was received in London with loud expressions of popular sympathy. Shortly afterwards he went to Parliament as member for Newport, Cornwall, and in 1647 was elected recorder of Bath. For some years he was actively and at times prominently engaged on the popular side in the proceedings of the House of Commons. In the extreme measures, however, leading to the deposition and death of the King, he declined all share; and being one of those whom Cromwell shortly after expelled from the House of Commons, he proceeded to assail him in print with an asperity equal to that with which he had before made war upon the bishops, in return being again subjected to several years' imprisonment. On Cromwell's death he returned to his place in Parliament, zealously interesting himself in the royal cause; after the Restoration, the office was bestowed on him of keeper of the records in the Tower, in the words of Charles II., "to keep busy Mr. Prynne quiet." His passion for pamphleteering, however, again involved him in difficulties with the House of Commons, from which, on a charge of seditious libel, he escaped expulsion only by confession of error and recantation. Henceforth he busied himself chiefly as a compiler of matter illustrative of constitutional and Parliamentary history. Of his works, which comprise nearly two hundred volumes, the most valuable are the *Calendar of Parliamentary Writs*, and his *Records*. He died at Lincoln's Inn, October 24, 1669.

PRYOR, PRY'OR, ROGER ATKINSON (1828—). An American journalist and lawyer. He was born near Petersburg, in Dinwiddie County, Va., graduated at Hampden-Sidney College in 1845, and at the University of Virginia in 1848, and studied law. He became editor of the *Southside Democrat* at Petersburg, and in 1854 he was called to Washington to edit the *Washington Union*, the principal organ of the Pierce Administration in the capital. In 1855 he was sent to Greece on a special diplomatic mission, and in 1856 he became editor of *The Richmond Enquirer*, one of the most influential papers in the South. In 1857 he established at Richmond

a paper called *The South*, in which his advocacy of extreme States-rights views brought him into national prominence. In 1858 he was elected to Congress, and was reelected in 1860, and brought upon himself considerable ridicule by challenging to a duel John F. Potter, a Republican Congressman from Wisconsin, and then refusing to meet him when Potter proposed that the duel be fought with bowie knives in a dark room. When Virginia seceded, he returned South, where he was elected to the Provisional Confederate Congress and the first regular Confederate Congress. Appointed colonel of a Virginia regiment, he participated in the campaigns about Richmond, distinguished himself in the battles of Williamsburg and Sharpsburg, and was brevetted brigadier-general, but resigned his commission in 1863 as a result of a quarrel with President Davis. He soon enlisted again as a private in Fitzhugh Lee's cavalry, and was captured and confined for some months in Fort Lafayette. Returning South on parole, he advised the South to submit. After the war he settled in New York, where he engaged in newspaper work, and studied law. Admitted to the bar, he rose rapidly to a prominent place in his profession, and in 1890 he was appointed by Governor Hill a judge of the Court of Common Pleas, in 1891 was elected to the same office for a fourteen-year term, and under the provisions of the new Constitution of 1894 was transferred as a justice to the reorganized Supreme Court. He retired from the bench on account of age in 1899.

PRYTANEUM (Lat., from Gk. *πρυτανείον*, *prytaneion*, from *πρύτανις*, *prytanis*, Lesbian *πρότανις*, *protanis*, presiding officer, from *πρό*, *pro*, before). A public building in various Greek cities, especially one in ancient Athens, where the State extended the rites of hospitality to foreigners and citizens of distinction.

PRZEMYSŁ, pshĕ'mĭzl. A fortified town in the Crownland of Galicia, Austria, situated on the San, 54 miles west of Lemberg (Map: Austria, H 2). It is the seat of a Roman Catholic and a Greek Orthodox bishop, and has a number of old churches and monasteries, a higher gymnasium, a seminary for teachers, etc. Its manufactures include machinery, spodium, liqueurs, floor, and naphtha. There is a considerable trade in wood, grain, leather, and linen. Population, in 1890, 35,209; in 1900, 46,349 including 8514 military.

PRZHEVALSKI, przhá-vál'y'ské, NIKOLAI MIKHAILOVITCH (1839-88). A Russian explorer, born of Polish parents at Kimbrovo, in the Government of Smolensk. He was educated at the Gymnasium of Smolensk, entered the military academy at Saint Petersburg, and from 1864 to 1866 lectured on history and geography in the Warsaw Cadet School. In 1867 he volunteered for service in Eastern Siberia, where he explored and botanized for two years in the valley of the Ussuri, publishing his *Notes on the Ussuri* on his return to Saint Petersburg. This book gave much valuable information on Northern Manchuria, and the Russian Geographical Society awarded him a medal for a paper written on the native population of that region. In 1870 he started on his first expedition to Central Asia, and traveled for three years in the west-central part of the Chinese Empire. The results of his explorations were published in

his *Travels in Mongolia*, which is the standard work on that part of the Empire. In 1876-77 he rediscovered the Lob-nor and traced the course of the great river Tarim, which enters that lake after draining the whole of Chinese Turkestan. He also reached the Altyn-Tagh range, which forms one of the northern barriers of Tibet. This great journey is recorded in his book *From Kulja Across the Tian-Shan to Lob-nor*. In his third expedition (1879-1880) he explored the sources of the Hoang-ho and a part of Eastern Tibet, and attempted to reach Lhasa from the north, but was unable to proceed farther than the region of the Kuku-nor, where he was deserted by his guide and suffered terrible hardships. His fourth journey (1883-85) extended from Kiakhta to the sources of the Hoang-ho, including the exploration of Northern Tibet. He crossed the Gobi waste, discovered the water parting between the upper courses of the Hoang and Yangtse rivers, and found the wild camel. Another attempt on this journey to reach Lhasa was unsuccessful. He was preparing for another journey into Tibet when he died of typhoid fever on the shores of Lake Issik-kul, at the town of Karakol, which, in 1893, was renamed Przhevalsk in his honor. He received the highest medals of the leading geographical and many other scientific societies, was pensioned by his Government, and was promoted to the rank of major-general. The Russian Imperial Academy of Science struck a special medal in his honor as the first explorer of the natural features of Central Asia.

PSALMANAZAR, sál'má-ná'zĕr, GEORGE (1679-1763). A celebrated impostor, born probably in Languedoc. He received a good education from the Jesuits, but was idle and pleasure-loving, spent his youth in wandering over a great part of Europe, as pilgrim, beggar, soldier, tutor, and servant, living for the most time in great want. At the age of twenty or thereabouts he began to masquerade as a Japanese convert from Formosa, assumed the name of Psalmanazar, was brought to England, and introduced to the Bishop of London by a certain Innes, chaplain of a regiment, whom he had met at Sluis. The Anglican Church rejoiced in the rescued heathen and sent him to Oxford to pursue his studies. Psalmanazar published a fabulous geography of Formosa, as well as a Formosan grammar and dialect specially invented by himself, and also an account of the Formosan religion and customs. About 1710, however, he seems to have repented of his continued fraud, confessed his guilt, and become truly religious. By acting as editor and compiler he made a comfortable living, and retained the esteem which he had gained under false pretenses. In 1764 appeared his memoirs under the title *Memoirs of * * ** *Commonly Known by the Name of George Psalmanazar*. These give no hint of his real name or birthplace.

PSALMODY (ML. *psalmodia*, from Gk. *ψαλμοδία*, a singing of psalms, from *ψαλμός*, *psalmos*, psalm, hymn, song, from *ψάλλειν*, *psallein*, to play on a stringed instrument + *ᾄδειν*, *adein*, *ældein*, *acidein*, to sing). In its widest sense, the singing of the Psalms of the Bible or other sacred songs in worship; often restricted, however, to the singing of metrical versions of the Psalms to short, simple airs. See HYMNOLOGY; HYMN-TUNES; WORSHIP.

PSALM OF LIFE, A. A well-known short poem by Henry W. Longfellow, published in the *Knickerbocker Magazine*, October, 1838.

PSALMS (from Gk. ψαλμός, *psalmos*, psalm, hymn, song), Book of. According to the Jewish canon, the first book of the third division of the Old Testament, known as *Kethûbim* or *Hajjio-grapha*; in the Christian canon the second book of the section. The arrangement of the latter was adopted from the Septuagint, which placed the books of Job, Psalms, and Proverbs in what was supposed to be the chronological order of their composition, under the influence of the tradition ascribing the first to Moses, the second to David, and the third to Solomon. The Hebrew title of the book is *Têhillim*, 'songs of praise;' the English psalms is from the Septuagint rendering of *Têhillim*, ψαλμοί. The Book of Psalms is properly a collection of hymns which became a manual of the temple service at Jerusalem in the post-exilic period. The collection consists of 150 compositions, divided in the Hebrew Bible like the Pentateuch into five books: (1) Psalms i.-xli.; (2) xlii.-lxxii.; (3) lxxiii.-lxxxix.; (4) xc.-cvi.; (5) cvii.-cl. The date of the final compilation, which, it must be borne in mind, is independent of the question of composition, is now brought down close to the beginning of the Christian Era; but long ere this time there existed collections of psalms, and abundant remains of such collections are found in the book which has been preserved to our time.

In reality, however, a threefold division, (1) i.-xli., (2) xlii.-lxxxix., (3) xc.-cl., would be more rational. Of these divisions, again, it is only the first, in which all psalms except the first two are ascribed to David (excluding the tenth, which is a continuation of the ninth, and the thirty-third, which the Septuagint ascribes also to David), that may be said to constitute a uniform group. The second division has as a distinguishing mark the use of Elohîm as the name of God instead of Yahweh in the main part of the division (xlii.-lxxxiii.). Taking up these Elohîm psalms, it is to be observed that they consist of (a) psalms ascribed to David, and (b) psalms ascribed to Levitical circles, viz. to Asaph or to sons of Korah. The Davidic psalms are li.-lxxi., placed between a single Asaphite psalm (l.) and the main Asaphite collection (lxxiii.-lxxxii.), while the Korahite collection is represented by xlii.-xlix. Lastly, lxxxiv.-lxxxix. appear to be an appendix of a miscellaneous character, attached to the division. The third division includes Books IV. and V., which have so many features in common as to give evidence of having once formed a single collection.

Of the three divisions, the first appears to be the oldest, and in the gradual formation of the Psalter, we may distinguish the following steps: (1) a Davidic collection, Book I.; (2) a second Davidic collection, li.-lxxii. (lxxii. being an addition); (3) a two-fold Levitical collection, (a) xlii.-xlix., (b) l., lxxiii.-lxxxiii.; (4) a combination of the second Davidic with the Levitical collections; (5) a supplement to this collection, lxxxiv.-lxxxix.; (6) a third collection, xc.-cl. The last step consisted in the combination of the three collections, to which the anonymous Psalms i. and ii. were prefixed; a division into five sections was then made in imitation of the

'Books of Moses,' each section provided with a doxology at the close. The purpose of the various collections is evident—to bring together religious hymns; the ascription of groups to members of the Levitical guilds may be regarded as sufficient evidence that the collections were to be used in the ritual. But while this may be admitted, it does not follow that all of the hymns included in the collections were composed for the temple ritual, nor do the considerations above set forth touch the core of the problem as to the date of composition of the hymns themselves.

The natural starting point for the investigation of this problem is the headings in the traditional Hebrew text and in the Greek translation. Although we are obliged to pass beyond the data furnished by these headings, they cannot be altogether set aside, even though their late origin admits no doubt. These headings appear to ascribe the authorship of 73 psalms to David; 49 are anonymous; and the remainder are divided among a variety of authors as follows: two are associated with Solomon, one with Moses, eleven with the sons of Korah, twelve with Asaph, one is attributed to Heman, one to Ethan. But the Hebrew preposition which is translated 'to' is an ambiguous particle, and it by no means follows that the expression a 'Psalm to David' means necessarily a psalm composed by David. It may mean that, but the same preposition would be used to convey the idea that the psalm was a 'Davidic' composition, that is to say, belonging to a class of compositions called for one reason or another after David. In such an instance as the psalms of 'the sons of Korah,' it is quite evident that the preposition 'to' cannot indicate authorship, since it is highly improbable that an entire family or guild should have composed any particular hymn. The same conclusion follows from the occurrence of several names at the head of a psalm, as e.g. xxxix. and lxii., which have the names David and Jeduthun attached, or cxxvii., which in the Septuagint bears the heading David and Jeremiah; or cxxviii., which has three names, David, Haggai, and Zechariah, attached to it in the Septuagint text. The assumption, therefore, is justified that when the headings were first attached to the psalms, it was not done exclusively with the purpose of indicating authorship, but also to specify the character of the collection to which they belong, and indeed this may very well have been the original meaning of the preposition in this connection. To be sure, only in the case of the series of psalms bearing the name 'sons of Korah' can we be certain that we actually have a collection by several authors, but it is plausible to assume that there was also a 'Davidic' collection designating not a series of hymns written by David, but for some reason called after him. It is natural that a later unscientific age which has created for itself a traditional David who differed largely from the historical one (see DAVID) should have seized upon the existence of a Davidic collection as a support for its traditions and converted David into the author of the 73 psalms bearing his name.

While, therefore, the headings are of genuine importance in a study of the growth of the psalm literature, we are thrown back upon internal evidence and the careful study of the style and of the religious views reflected as a final means of determining the date of composi-

tion of any particular hymn; and if these methods fail, the problem must be frankly declared insoluble. In this investigation it is further necessary to distinguish in the case of many of the psalms between older portions and modifications as well as additions introduced at a subsequent period in the process of editing, or to adapt them to the religious aspirations of a later age. The limitations of such an investigation must, however, be recognized. In many of the psalms the references to political or social conditions are of so general or vague a character that agreement among scholars as to the period to which a particular psalm belongs is hardly to be expected; nor is the style in all cases so pronounced as to be of service in settling the date of composition. As a consequence, a candid criticism will confess in many cases its inability to solve the problem and rest content with partial results.

Accepting the general order in the growth of the Psalter as above outlined, the most important question involved in a more detailed consideration of the composition of individual poems is whether any belong to the pre-exilic period. While some critics are disposed to limit the pre-exilic psalms to a very small number, others deny the pre-exilic origin of all. To the former it seems quite improbable that after the Exile psalm composition should have assumed such tremendous importance without any impulse from an earlier age. The example of Babylonia and Egypt, where hymns and psalms formed part of the ritual from a remote period, would have been sufficient to lead to the production of such compositions among the Hebrews after they had once established a large sanctuary in Jerusalem, and the religious views embodied in some, if not in many, of the psalms are sufficiently restricted to make them fit in with the conceptions held of Yahweh before the destruction of Jerusalem. Whether, however, one may go back as far as the days of David for the beginning of psalm composition is another question. While Delitzsch accepted 44 psalms as Davidic, Ewald reduced the number to 17 and Baethgen admits only 3, namely, the first, third, and fourth, and of these he feels certain only about the first. The number of psalms ascribed to the pre-exilic period by this critic is above thirty. On the other hand, Olshausen, Cheyne, and Duhm deny that there are any Davidic or pre-exilic psalms. Coming to the post-exilic period and including among these older psalms that have been worked over, the bulk is by some critics placed before the advent of Greek rule in Palestine. The psalms of the Persian period voice the hopes, struggles, and fears of the religious community in Jerusalem, and the frequent use of the first person in those psalms is perhaps not to be interpreted as representing the sentiments of the individual, but rather the community, and in some cases the people of Israel as a whole. The number of psalms that belong to the Greek period or the Maccabean age cannot be determined with certainty. Olshausen placed the bulk of the Psalter in the Maccabean age, and the most recent commentator, Duhm, assigns most of the psalms to the Maccabean and Hasmonean periods. Cheyne places 25 psalms in this later period. But others think that only six can be ascribed with certainty to the Maccabean period.

Finally, of the three large collections already indicated, it may be supposed that the first was made in the days of Ezra, the second toward the close of the Persian period, and the third in the Greek period; it should again be emphasized that these approximate dates for the collection do not directly affect the date of composition of the psalms included in each collection. If there are any pre-exilic psalms, they are likely to be found in the first collection.

In connection with the Psalms it seems appropriate to consider briefly the general subject of Hebrew poetry, of which the Psalms represent the most notable product. Of the three classes of poetic composition usually distinguished, the lyric, the epic, and the dramatic, only the first is, strictly speaking, represented in the Old Testament; it should, however, be borne in mind that the lyric poetry of the Hebrews embraces several subdivisions, among which *gnomic* poetry stands out so prominently that it may almost be designated as a special variety, and certain scholars think that the rudiments of dramatic composition are found, as in Canticles (q.v.), the Book of Job, and elsewhere. Before the period of conscious poetic composition as an art and a profession is reached we find among the Hebrews, as among other nations, what may be called folk-poetry. If the view be correct which regards Canticles as a collection of popular wedding songs, these represent one type of this poetry. Of laments for the dead, which constitute among all peoples the second most notable division of folk-poetry, the only specimens preserved in the Old Testament belong to the more advanced period, such as David's dirge over Saul and Jonathan (II. Sam. i. 17-27), which is a type of Hebrew poetry in its most polished form. But such songs as the "Song of the Well" (Numbers xxi. 17-18), the "Song of Lamech" (Gen. iv. 23-24), and the "Song of Deborah" (Judges v.) are illustrations of old folk-poetry which show at the same time its wide range. No doubt the Hebrews had numerous harvest and drinking songs, tribal war chants, and songs celebrating the exploits of tribal heroes, which are, it is to be feared, irretrievably lost, but the persistent tradition regarding the titles of at least two of such collections, one the "Book of the Wars of Yahweh," the other the "Book of the Upright," or, as the Septuagint has it, the "Book of Songs" (see JASHER, BOOK OF), is a proof of the popularity which these compositions continued to enjoy. Passing into the domain of artistic poetry, we have, besides the Psalms, the Book of Lamentations, a series of dirges over the destruction of Jerusalem, composed in the manner of the popular laments over the dead (see JEREMIAH, LAMENTATIONS OF), and the three great specimens of gnomic poetry, Proverbs, Job, and Ecclesiastes (qq.v.), in the Old Testament proper, to which the Book of Sirach or Ecclesiasticus (q.v.) is to be added.

Concerning the form of Hebrew poetry, difficult problems arise which have not yet found a satisfactory solution. The line and the verse are found, and a characteristic feature that has long been recognized is the parallelism of the verse members (*parallelismus membrorum*). That is, the thought is expressed in two clauses of approximately the same length, of which the second bears a definite relation to the first, either repeating the thought in different words

(synonymous parallelism, cf. Psalm i. 2), or presenting a thought in contrast to that of the first (antithetic parallelism, cf. Psalm i. 6), or corresponding in structure to the first, the parallelism being in the form rather than the thought (synthetic parallelism, cf. Psalm ii. 6). All these elements are found in Babylono-Assyrian poetic literature, and may be regarded as characteristic of ancient Semitic poetry in general. The combination of verses into strophes was, of course, a step that was bound to be taken, and the earliest and most common strophe was that of four lines, but all species of variation were introduced, and it is difficult to determine the character and number of these variations. A long controversy has been waged in regard to the question of Hebrew metre, and while at present there is a general disposition among scholars to recognize the existence of well-defined metrical forms in Hebrew poetry, there is no agreement as yet to the number or even nature of these forms. Four theories are at present contending for the mastery. The one represented chiefly by J. Ley (*Grundzüge des Rhythmus des Vers- und des Strophenbaus in der hebräischen Poesie*, Halle, 1875, and *Leitfaden der Metrik der hebräischen Poesie*, ib., 1887), rests on the counting of the word-accent, of which there is at least one in every word (barring enclitics), and in some words two. According to the theory, the number of unaccented syllables is not taken into account, and the metre depends solely upon the number of accented ones. A second theory advocated chiefly by G. Bickell (*Carmina Veteris Testamenti Metrica*, Innsbruck, 1882) is an application of the principles of Syriac metres to the poetry of the Old Testament, and recognizes the various metres by the number of 'rises' and 'falls' in all the syllables of each line. The fatal objection to the theory is that it involves constant changes in the Massoretic text to admit of being carried out, and while all scholars are agreed that the Massoretic text requires critical treatment, a hypothetical metrical theory does not form a satisfactory point of departure for a pruning process. Recently Grimme ("Abriss der biblisch-hebräischen Metrik," in the *Zeitschrift der deutschen morgenländischen Gesellschaft*, 1896, pp. 529-584, and 1897, pp. 683-712) has endeavored by a combination of the accent and the quantity theory to work out new principles which rest on the assumption that every syllable has, independent of the accent or in combination with it, a definite quantity. The value of the various quantities of all the syllables in a line plus the principal tone-syllable in a word forms the means of determining the kind of metre employed. While Grimme's theory is not open to the objection that applies to Bickell's, it assumes values for the vowel signs attached to the Hebrew words which vary radically from those hitherto accepted. His theory, therefore, stands or falls with the system of accents and vowels that he sets forth in his work, *Grundzüge der hebräischen Accent- und Vocalehre* (Freiburg, 1896).

The latest investigation of the subject, and one which may fairly be considered to mark a decided advance toward the solution of the problem, is represented by Eduard Sievers's "Studien zur hebräischen Metrik," of which the first part appeared in the *Abhandlungen der philologisch-historischen Classe der königlich sächsischen Gesellschaft der Wissenschaften*, vol. xx., 1

(Leipzig, 1901). Sievers, whose contributions to metrical studies in general lend to his utterances great authority, endeavors to take into account the 'unaccented' syllables as well as the 'accented' in his study of the form of Hebrew poetry. Recognizing, as his predecessors did, that the fundamental features of Hebrew poetry are the 'line' and 'verse,' he has drawn up on the basis of an original distinction between 'singing' and 'recitative' poetry a scheme of the variations in 'lines' and 'verses' (or 'rows' (*Keihen*) and 'periods' (*Perioden*), as he prefers to call them, to be detected in Hebrew poetry. The normal foot in Hebrew poetry consisting of three syllables (or their dissolution), there are to be distinguished 'simple' lines consisting of two, three, and four feet, with a preponderance of the 'two feet' line, but with further complications by the multiplication of this kind of a line to form a 'six feet' line. The combination of lines leads again to a variety of verses or 'periods,' and among these the most common again is the 'symmetrical' verse formed of the doubled form of the triple 'two-feet' line. In the course of his elaborate investigation, Sievers endeavors to take into account not only the quantity and accent of words, but also enclitics that have no 'tone' and words which by close combination with others have lost their 'tone.' It is perhaps too early to pronounce a verdict on Sievers's scheme, but it seems safe to predict that he has directed the study into new channels, and has tended to discourage theories that either give to Hebrew poetry an 'eccentric' status or that can only be carried out by violent distortions of the Massoretic text.

BIBLIOGRAPHY. Of commentaries, translations, etc., mention may be made of those by Olshausen (Leipzig, 1853); Hitzig (2d ed., Leipzig, 1863-65); Ewald (*Die Dichter des Alten Bundes*, 2d ed., Göttingen, 1865-67; Eng. trans., London, 1880); Graetz (Breslau, 1882-83); Cheyne (*The Book of Psalms*, London, 1884; *The Book of Psalms with Commentary*, London, 1888); Perowne (London, 1864; new ed. 1892); Nowack (Gotha, 1888); Kirkpatrick (*Cambridge Bible for Schools and Colleges*, Cambridge, 1891 sqq.); Baethgen (2d ed., Göttingen, 1897); Delitzsch (5th ed., Leipzig, 1894; Eng. trans., Edinburgh, 1887-89); Wellhausen (*The Polychrome Bible*, Leipzig, 1896; Eng. trans., New York, 1898); Duhm (Freiburg, 1899). Consult, also: Cheyne, *The Historical Origin and Religious Ideas of the Psalter* (Bampton Lectures for 1889, London, 1891); Loeb, *La littérature des pauvres dans la Bible* (Paris, 1892); Davidson, *The Praises of Israel* (London, 1893); Robertson, *The Poetry of the Psalms* (London, 1898); and the introductions to the Old Testament, and Old Testament theologies of Schultz, Kayser-Marti, Smend, and Dillman. For Hebrew poetry, besides the works already mentioned, consult: Lowth, *De Sacra Poesi Hebræorum* (Oxford, 1753; trans. by Gregory, 1847); D. H. Müller, *Strophenbau und Responion* (Vienna, 1899).

PSALTERY (OF. *psalteric*, from Lat. *psalterium*, from Gk. ψαλτήριον, stringed instrument, from ψάλλειν, *psallein*, to play on a stringed instrument). A sort of dulcimer (q.v.), played with the fingers instead of with hammers. It is of Greek origin, and is related to the Persian *santir* and the Arabic *kanun*. It was a prototype of the pantaleon (q.v.), and so one of the large

family out of which the pianoforte ultimately developed. It was especially important in this respect since, in the fourteenth century, a keyboard mechanism was attached to the horizontal psaltery, and this keyed psaltery became the direct parent of the spinet, harpsichord, and virginal (qq.v.). It was popular in the Middle Ages for its sweetness of tone and purity of intonation. The Hebrew *kinnor* is rendered psaltery in the Authorized Version of the Bible wherever it is used, except in a few passages in Isaiah and in Amos, where it is translated viol.

PSAMMETICHUS, sām-mēt'ī-kūs (Lat., from Gk. Ψαμμήτιχος, Egyptian *Pscmtek*). The name of three kings of Egypt of the Twenty-sixth or Saitic Dynasty. **PSAMMETICHUS I.** (B.C. 663-609), son of Necho, Prince of Memphis and Sais, succeeded his father in B.C. 663 as a vassal of Ashurbanipal, King of Assyria, but a few years later (perhaps about 660) he renounced his allegiance, and, subduing the petty rulers who divided the country, made himself master of all Egypt. He strengthened his title to the throne by marrying a daughter of Queen Amenerdas, and established his capital at Sais, in the Delta. His military success was due to the aid of Greek and Carian mercenaries furnished, it is said, by Gyges, King of Lydia, and he subsequently introduced considerable numbers of these troops into the Egyptian army. Psammetichus protected the country by establishing strong garrisons on the frontiers, and promoted commerce by encouraging foreigners to settle in the Delta. His flourishing reign was marked by a very extraordinary renaissance in art.—**PSAMMETICHUS II.** (B.C. 594-588) was the son of King Necho and the grandson of Psammetichus I. His name is found in the quarries at Silsileh, Wadi Hammāmāt, and Tūra, and during his reign building operations appear to have been carried on in many of the sanctuaries of Egypt.—**PSAMMETICHUS III.** (B.C. 526-525), the last King of this dynasty, was conquered by Cambyses in B.C. 525, and Egypt thus became a Persian province.

PSARA, psā'rā, or **IPSARA**. An island in the Ægean Sea belonging to Turkey and situated ten miles west of the northern end of Chios (Map: Balkan Peninsula, E 5). Area, 34 square miles. Previous to the Greek War of Independence it had a population of nearly 30,000 and considerable commerce. In 1824 it was captured by the Turks after a stubborn resistance, and since then it has declined, having now a population of only 4500, chiefly Greeks.

PSCHUTT, pshūt. A slang term which came into vogue in Paris about 1880 to designate the highest degree of the fashionable elegance, which had been known as *chic* (q.v.).

PSEUDEPIGRAPHIA. See **APOCRYPHA**; **APOCALYPTIC LITERATURE**.

PSEUDO-CLEMENTINES, sū'dō. See **CLEMENTINA**.

PSEUDO-DEMETRIUS. The name frequently given in Russian history to several pretenders to the throne during the early years of the seventeenth century. See **DEMETRIUS**.

PSEUDO-ISIDORIAN DECRETALS, or **FALSE DECRETALS**. A collection of canon law which was made, probably, about the middle of the ninth century. It purports to be the work of Saint Isidore of Seville (q.v.), to whom the

name Mercator is here given. The first part of this collection contains fifty of the Apostolic Canons and some sixty decretals, purporting to be of the popes from Clement I. (101) to Melchisedes (314), arranged in chronological order. The second part consists chiefly of a body of canons which can be traced to the *Hispana*, a collection made late in the seventh century. The third part consists of thirty-five supposed decretals. This collection continued to be regarded as of unquestioned authority until the fifteenth century, when Cardinal Nicholas of Cusa first expressed doubts of their authenticity. A similar adverse judgment was rendered by scholars of the Reformation, and has been confirmed by modern historical criticism. These false decretals are thought to have been compiled for the purpose of developing the powers of the episcopate in opposition to the rights of metropolitans and of provincial synods. The critical edition of this collection is by Hinschius, *Decretales Pseudo-Isidorianæ et Capitula Angilramni* (Leipzig, 1863). There is also a partial English translation in the *Ante-Nicene Fathers*, vol. viii.

PSEUDOLUS (Lat., the liar). A somewhat loosely constructed comedy of Plautus, performed in B.C. 191.

PSEUDOMORPH. See **CRYSTALLOGRAPHY**.

PSEUDONEUROPTERA (Neo-Lat. nom. pl., from Gk. ψευδής, *pseudēs*, false + νῆρον, *neuron*, nerve + πτερόν, *pteron*, wing). An order of insects including those groups of the older order Neuroptera of Linnaus in which the metamorphoses are incomplete. As an ordinal term it is not now in use. Erichson, who originally founded the group as a suborder, included in it the Termitidæ or white ants, the Psocidæ or book-lice, the Ephemeriidæ or May-flies, and the Libellulidæ or dragon-flies (qq.v.). These groups now form the orders Isoptera, Corrodentia, Ephemeriidæ, and Odonata. Sharp retains the term Pseudoneuroptera as a 'division' of the Neuroptera, and includes in it only the families Embiidæ, Termitidæ, and Psocidæ.

PSEUDONYM (Fr. *pseudonyme*, from Gk. ψευδώνυμος, *pseudonymos*, having a false name, from ψευδής, *pseudēs*, false + ὄνυμα, *onyma*, ὄνομα, *onoma*, name). A name assumed by an author for veiling his identity or for other reasons. A common equivalent is *pen-name*. *Nom de plume*, an expression often used in English speech and writing, is not employed by the French. For contemporary pseudonyms, consult *Who's Who*, published annually. The standard works are Halkett and Laing's *Dictionary of the Anonymous and Pseudonymous Literature of Great Britain* (4 vols., Edinburgh, 1882-88); Cushing's *Initials and Pseudonyms* (2 vols., New York; 1st series, 1885; 2d series, 1888); and Barbier, *Dictionnaire des ouvrages anonymes* (4 vols., Paris, 1872-79; supplement by Brunet, 1889). See **ANONYMOUS**.

PSEUDO-PHILO. See **APOCRYPHA**, section on *Old Testament*.

PSILOMELANE (from Gk. ψίλος, *psilos*, bare + μέλας, *melas*, black). A hydrous manganese manganate that is found massive, has a submetallic lustre, and is dark gray to black in color. It occurs in botryoidal and stalactitic forms in the Harz, in Thuringia, Hungary, England, and in the United States in Vermont, Virginia, and Arkansas. Psilomelane is the com-

monest of the manganese minerals, with the possible exception of pyrolusite.
